2563. Ashton, Alan B. & Trowill, Jay A. (Saginaw Valley Coll., University Center, Mich.) **Effects of reinforcement shifts upon lick rate.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 8-10.—Observed marked increments in lick rate in saccharin drinking following a temporary shift to water in both deprived and nondeprived rats. Similar increases were not observed when sucrose was the reward. Ss were 10 female albino rats in Exp. I and 10 female albino rats in Exp. II. Similarities and differences of lick rate data to intake data are discussed.—*Journal abstract.*

2564. Campbell, Patrick E., Crumbaugh, Charles M., Rhodus, Deborah M., & Knouse, Stephen B. (Southern Methodist U.) **Magnitude of partial reward and amount of training in the rat: An hypothesis of sequential effects.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 120-128.—Tested 40 female albino Sprague-Dawley rats in each of 2 experiments with alternating reward (R) and nonreward (N) for 6 trials a day in a runway. Reward was 2 or 20 .045-gm pellets, and Ss were given either brief or extended training according to a 2×2 factorial design. Large-reward Ss learned a pattern discrimination in both experiments (fast speeds on R trials and slow speeds on N trials), but small-reward Ss learned the discrimination only in Exp. II. Resistance to extinction following extended training was greater for small than for large reward in both experiments. The opposite effect occurred for briefly trained Ss but only in Exp. II. Results support a sequential discrimination hypothesis derived from E. J. Capaldi's aftereffects theory. (15 ref.)—*Journal abstract.*

2565. Grossen, Neal E. (Sacramento State Coll.) **Effect of aversive discriminative stimuli on appetitive behavior.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 90-94.—Investigated whether a 1971(Apr), Vol. 88(1), 90-94.—Investigated whether a non-safety signal, i.e., a stimulus which predicts the non-occurrence of shock, serves as a positive incentive, or acts to inhibit a preexisting fear. The latter is indicated by the finding in 80 male Long-Evans rats that a safety signal supports appetitive behavior only in a fear-eliciting situation. (16 ref.)—*Journal abstract.*

2566. McCloskey, J. L. & Tombaugh, Tom N. (Carleton U., Ottawa, Ontario, Canada) **Sucrose concentration, constant delay of reward, and resistance to extinction.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 128-132.—Combined 3 levels of sucrose concentration (4, 16, and 64%) factorially with 3 constant delay intervals (0, 6, 12 sec.) in the discrete-trial bar-press situation. 72 Sprague-Dawley naive female albino rats served as Ss. Results indicate that both acquisition and extinction performance were an increasing function of concentration and a decreasing function of delay, with differences in extinction for both parameters being attributable to different terminal acquisition levels. Results are evaluated regarding E. Capaldi's sequential hypothesis with emphasis on the factor of associative strength in determining the generalization function for these 2 parameters.—*Journal abstract.*

2567. Oley, Nancy N. & Slotnick, Burton M. (Columbia U.) **Nesting material as a reinforcement for operant behavior in the rat.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 41-43. Paper strips served as an adequate reinforcement for the acquisition and maintenance of fixed-ratio barpressing in 2 pregnant Wistar rats. Prior to parturition, only a small daily nest was built and barpressing occurred only in the dark part of the lighting cycle. Following parturition, barpressing for nesting material greatly increased, and sustained periods of responding alternated with nest-building and pup-care activities. *Journal abstract.*

2568. Rescorla, Robert A. (Yale U.) **Summation and retardation tests of latent inhibition.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 77-81.—Reports 2 experiments with 32 and 16 male Sprague-Dawley rats assessing the effects of nonreinforced exposure to a tone. In Exp. I, preexposure retarded subsequent conditioning of suppression to that tone, but did not establish conditioned inhibition as measured by a summation test procedure. In Exp. II, preexposure retarded subsequent conditioning of inhibition to the tone. Results are interpreted in terms of reduced stimulus salience resulting from preexposure.—*Journal abstract.*

Reinforcement Schedule

2571. Allison, Tom S. (Washington State U.) **Concurrent schedules of reinforcement: The relationship between relative performance measures and relative frequency of reinforcement as a function of changeover delay.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3719-3720.

2572. Blackman, D. E., Thomas, G. V., & Bond, N. W. (U. Nottingham, England) **Second-order fixed-ratio schedules.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 53-55. Exposed 6 pigeons to chained and tandem fixed-ratio (FR) schedules in which the ratio requirement in each of 10 components was 1 FR 10 (1 R 1). Results suggest similarities between a conventionally defined unit of behavior, e.g., a single keypeck, and the

sequences of schedule-controlled behavior, which are treated as unitary responses in other 2nd-order schedules.—*Journal abstract.*

2573. Hug, James J. (U. Toronto, Ontario, Canada) **Frustration effects after varied numbers of partial and continuous reinforcements: Incentive differences as a function of reinforcement percentage.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 57-59.—Assessed magnitude of the frustration effect (FE) after 16, 40, and 64 acquisition trials under CRF and PRE conditions using 40 male albino Wistar rats as Ss. Data indicate that FE magnitude increased with the number of training trials under both reinforcement schedules and that, although the effect was more pronounced under CRF conditions with relatively few reinforcements, there was no difference in the magnitude of the effect as a function of CRF vs. PRE after additional reinforcements. Assuming that the strength of incentive or expectancy is a factor in the magnitude of the FE, these data can be taken as confirming K. W. Spence's speculation that PRE decelerates the conditioning of incentive but does not affect its asymptotic strength.—*Journal abstract.*

2574. Hug, James J. (U. Toronto, Ontario, Canada) **Frustration effect after development of patterned responding to single-alternation reinforcement.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 61-62.—Using a 20-min ITI, 1 group received single-alternation PRE in the 1st alley of a double-runway apparatus. A 2nd group also ran to a single-alternation schedule in Alley 1, but did not run in Alley 2. Results indicate that single vs. double alley running did not affect the rate of development, or the terminal strength, of patterned responding. A substantial decrease in the magnitude of the frustration effect occurred in the 2nd alley as patterning developed in the 1st 20 male albino Wistar rats were Ss.—*Journal abstract.*

2575. Hug, James J. (U. Toronto, Ontario, Canada) **Number of food pellets and the development of the frustration effect.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 59-60.—Following few-trials PRE studies, the effect of number of food pellets (total magnitude of reward equated) on the development of the frustration effect (FE) was investigated using 40 male albino Wistar rats. Multiple pellets in the 1st goalbox resulted in more rapid development of the FE but did not affect its terminal magnitude. In contrast, the number of pellets in the 2nd goalbox had no effect on either the rate of development of the terminal strength of the FE. Results support the frustration-theory account of few-trials experiments.—*Journal abstract.*

2576. Jones, Elvis C. (Frostburg State Coll.) **A correlational study of pre- and postgoal competing responses.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 25-27.—60 male Sprague-Dawley rats were trained and extinguished in a straight runway under CRF or PRE. Each S within each group received a different amount of reinforcement. Competing responses in the runway were correlated with competing responses that occurred after the S reached the food cup. There was a significant relationship between competing responses emitted en route to the goal and competing responses emitted after reaching the goal. The direction and magnitude of this relationship depended on both the percent and amount of reinforcement.—*Journal abstract.*

Punishment & Extinction

2580. Blintz, John. (U. California, Davis) **Between- and within-subject effect of shock intensity on avoidance in goldfish (*Carassius auratus*).** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 92-97.—Assessed the effects of shock intensity on avoidance conditioning in goldfish. In Exp. I with 120 Ss, independent groups received 1 of 5 shock intensities as the UCS. In Exp. II with 36 Ss, different CSs cued different shock intensities within Ss. Avoidance performance was an inverted U-shaped function of shock intensity in Exp. I and a direct function of shock intensity in Exp. II. Shock intensity was interpreted to have a facilitory effect on conditioning fear and a suppressive effect on subsequent responses. In the between-Ss procedure, the suppressive effect overrides the facilitative effect at higher intensities resulting in poorer performance. Within Ss, the suppressive effect is equated across conditions and the facilitory effect is seen at higher shock intensities.—*Journal abstract.*

2581. Boe, Erling E. (U. Pennsylvania) **Variable punishment.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 73-76.—Investigated (a) the effect of varying punishment intensity from trial to trial vs. fixed-intensity punishment, and (b) the effect of scheduling punishment on a variable-ratio vs. a fixed-ratio schedule. The lever response with footshock was used to test 80 male albino Charles River rats. Variable-intensity shock (50-110 V) was substantially more suppressive of lever pressing than fixed shock (80 V) while there was no significant difference between variable- and fixed-ratio punishment.—*Journal abstract.*

2582. Knouse, Stephen B. & Campbell, Patrick E. (Southern Methodist U.) **Partially delayed reward in the rat: A parametric study of delay duration.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 116-119.—Tested male albino Holtzman rats in a straight-alley runway in 2 replications with 40 Ss each. Acquisition consisted of 5 trials a day for 10 days under a 50% irregular partially delayed reward schedule. Delay was varied as a between-groups factor with 0-, 8-, 16-, 24-, 32-, 40-, 48-, or 56-sec delays in the goal box. Extinction consisted of 5 trials a day for 8 days to a

nonreward confinement of 15 sec. In acquisition there were no differences in performance among delay-duration groups in the start or run times. In the goal times the 0-sec group ran significantly faster than all other groups. During extinction all speed measures produced an increasing linear relation between duration of delay and resistance to extinction. Results are discussed in terms of current theories of extinction. —*Journal abstract.*

2583. Shearman, Richard W. (State U. New York, Psychological Services, Binghamton) **Response-contingent CS termination in the extinction of avoidance learning.** *Behaviour Research & Therapy*, 1970 (Aug), Vol. 8(3), 227-239.—5 groups of rats were employed in a 2 × 2 plus control group design with flooding (100-sec exposure to the CS alone vs. 20 5-sec exposures) and confinement as the independent variables. After learning a 2-way avoidance response experimental groups received 1 of the 4 treatments while the controls rested. During 9 days of regular extinction which followed, the avoidance responses of all experimental groups were equally (and virtually) extinguished from the 1st day; controls showed little extinction. The 4 treatment procedures had in common that CS termination was not response-contingent; this was hypothesized to be responsible for the elimination of the response. To test this hypothesis all Ss were retaught the response following which the controls received extinction with non-response-contingent CS termination while the experimental animals received response-contingent CS termination. The results of the 1st extinction were reversed. It is concluded that avoidance responding is "inextinguishable" only so long as the response results in CS termination. Generalizing to humans, the study supports the conclusion that total duration of exposure to the CS and inability on the part of the patient to terminate the CS may be the 2 essential factors in successful behavioral treatment of phobias. —A. Barclay.

2584. Smith, Kendon. (U. North Carolina, Greensboro) **A possible explanation for the Estes phenomenon in terms of a symmetrical law of effect.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 61-62. In 1944, Estes reported experimental results which seemed to uphold the hypothesis that punishment merely "suppresses," rather than truly "weakens," behavior. It appears, however, that the conditions of Estes' experiment were such as to favor (a) the attachment of a strong secondary reinforcing effect to the response of lever-pressing; (b) the persistence of that effect in spite of any weakening, by punishment, of the response itself; and (c) the action of that effect to restrengthen the response, once punishment had been terminated. Evidently, then, Estes' results are not contrary to Thorndike's original, symmetrical law of effect. *Author abstract.*

2585. Terris, William & Sears, Ronald J. (De Paul U.) **Determinants of generalized resistance to punishment.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 19-20.—Animals trained to resist gradually increasing shock-punishment in order to obtain food subsequently show increased resistance to shock-punishment in a novel testing situation. An attempt was made to determine the extent to which this transsituational resistance to punishment is due to: (a) an approach

response which generalizes from 1 fear situation to another, (b) shock simply losing its aversiveness, or (c) shock becoming a secondary reinforcer. In a training apparatus, 190 albino rats received 1 of 4 treatments: (a) shock-food pairings contingent upon an approach response, (b) shock-food pairings independent of any response, (c) shock not paired with food and independent of response, or (d) no shock but food. Subsequently, in a novel testing situation, each response produced either: (a) both food and shock, (b) food but no shock, (c) no food but shock, or (d) no food and no shock. Highly reliable F ratios were obtained for the training factor, the testing factor, and the Training × Testing interaction. Results indicate that the approach response acquired in the training apparatus did generalize to the testing apparatus. In addition, the aversiveness of shock was reduced, partially by shock-food pairings, and partially by mere experience with shock. There was no evidence for the secondary reinforcement hypothesis. —*Author abstract.*

2587. Wong, Paul T. (U. Texas) **Coerced approach to shock and resistance to punishment suppression and extinction in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 82-91.—Hypothesized that the continuation of any ongoing behavior in the face of disruptive events increases responding in other disruptive situations. 30 naive male Wistar rats and 32 naive rats were tested in 2 experiments involving coerced approach to intermittent shock and consistent shock. Results demonstrated that such training (a) increased resistance to suppression by punishment under conditions of noncoercing in the same situation, and (b) increased resistance to extinction of a food-rewarded running response. Results are interpreted in terms of A. Amiel's general theory of persistence (17 ref.). —*Journal abstract.*

2588. Woodard, William T. & Blitteman, M. E. (U. South Florida) **Punishment in the goldfish as a function of electrode orientation.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 72-73. For each response to a nipple from which they were trained to take liquid food, 83 in goldfish were punished with a brief AC shock administered through a pair of stainless steel electrodes placed either to the right and left of the S, over and under it, or in front and back of it. As anticipated, on the assumption that the aversiveness of shock is a function of the potential difference across the S's body, the right-left orientation of the electrodes was found to produce the least suppression of feeding and the front-back orientation the most. *Journal abstract.*

SOCIAL & SEXUAL BEHAVIOR

2589. Box, Hilary O. & Westby, G. W. (U. Reading, England) **Behavior of electric fish (*Gymnotus carapo*) in a group membership experiment.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 27-28.—Used 4 specimens of the electric fish *Gymnotus carapo* to investigate the social interactions of members of this species. 4 different 2-member groups were established and observed for

20-min sessions every day for 8 days. 2 categories of aggressive behavior, approach, and threat movements, were found to be inversely related to the phenomenon of "turning off" of electrical pulses. Further, the S that became the more aggressive in any pairing could be predicted from the mean pulse frequency measured prior to the social experiment.—*Journal abstract.*

2590. Denenberg, Victor H. & Zarrow, M. X. (U. Connecticut) **Rat pax.** *Psychology Today*, 1970(May), Vol. 3(12), 45-47, 66-67.—Tested the hypothesis that "aggressive behavior is the result of interaction between the environment and the genetic make-up of the organism" using mice and rats. Rats who were reared with mice did not kill mice when later placed in a cage with a mouse although 45% of the control rats killed mice. In another study only 5 of 115 pairs of mice reared by rat mothers fought each other while 46% of the control mice fought. The levels of corticosterone of the control mouse-reared mice also differed from that of the rat-reared mice. Using "rat aunts" with nursing mice it was possible to show that differences in fighting tendencies and corticosterone levels were due to the social interaction of the rats and not to the differences in milk content.—*E. J. Posavac.*

2591. Flandera, V. & Nováková, V. (Czechoslovak Academy of Sciences, Inst. of Physiology, Prague) **The development of interspecies aggression of rats toward mice during lactation.** *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 161-164.—Tested the aggressive behavior of rats towards mice in 4 breeding groups of laboratory female rats (Wistar-SPF, and conventional Long-Evans, Sprague-Dawley, and Wistar) before mating and during lactation. On each testing day, independent groups of females were tested. The incidence of aggression before mating was at a low level for all Ss. During the period of lactation aggression increased significantly only in 1 group, namely the females of the Wistar-SPF group. In this group the aggressive behavior of mothers increased from parturition and reached its maximum on the 5th day of lactation (60% of occurrence). Thereafter incidence of aggression decreased and disappeared entirely by the 15th day of lactation. This development is independent of the immediate presence of pups with mother, and of environment of the female during the time of testing. The aggressive behavior of the females who killed mice during the period of lactation had a long-term character, and outlasted the weaning of the pups.—*Journal abstract.*

2592. Nevo, Eviatar. (Hebrew U., Lab. of Genetics, Jerusalem, Israel) **Mole rat spalax ehrenbergi: Mating behavior and its evolutionary significance.** *Science*, 1969(Jan), Vol. 163(3866), 484-486.—Within 4 groups of Israeli Spalax ehrenbergi, each with different numbers of chromosomes, it was found that mating behavior provided partial reproductive barriers. It is concluded that selective matings between chromosome forms may complement a cytologic isolating mechanism to prevent widespread natural hybridization.

2598. Somerville, John W. (Southern Illinois U.) **Motion parallax in the visual cliff situation.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 43-53.—Walk's assumption that motion parallax is "the critical cue" for depth discrimination by newly hatched chicks was assessed by the use of 3-dimensional striped patterns on each side of the centerboard. The 3-dimensional patterns served 2 purposes: (a) to test a hypothesis that chicks would show no significant preference for the "shallow" side if motion parallax cues were presented independent of the solid appearance furnished by 2-dimensional surfaces, and (b) to permit direct manipulation of the stimulus basis for motion parallax. Ss were 250 6-24 hr old chicks. Results provide evidence that stimuli for motion parallax, devoid of the solid appearance of 2-dimensional surfaces, are sufficient cues for depth discrimination by chicks.—*Journal abstract.*

DEVELOPMENTAL PSYCHOLOGY

2599. Altus, William D. (U. California, Santa Barbara) **Sex role dissatisfaction, birth order, and parental favoritism.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971.

6(Pt. 1), 161-162.—Predicted that more frequent sex-role dissatisfaction, as reported by undergraduate females from 2-child families, would be found among those females who were their father's favorite child or who were born 2nd. It was also predicted that greater sex-role dissatisfaction would be correlated with poor adjustment. The prediction relating to birth order was sustained but the one relating to adjustment was not. The prediction on paternal favoritism was partially sustained. Females with male sibs tended to be dissatisfied with their sex role. Favoritism had no effect if the sib was female.—*Author abstract.*

2600. Cavior, Norman & Doeckel, Paul R. (West Virginia U.) **Physical attractiveness self concept: A test of Mead's hypothesis.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 319-320.—Observations from various sources indicate that what a person thinks of his physical appearance is very important in terms of his psychosocial development and interpersonal relations. Using 5th and 11th graders, the study failed to support Mead's hypothesis that the self-concept is derived from the judgments of significant others. Physical characteristics of Ss were found to be of greater importance than the opinions of significant others apparently because liking or disliking the person being judged affects the judgments of his physical attractiveness.—*Author abstract.*

2601. Eckerman, Carol O., Rheingold, Harriet L., & Helwig, Richard A. (U. North Carolina, Chapel Hill) **A laboratory for developmental psychologists.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 54-62.—Describes the main features of the laboratories for developmental psychologists at the University of North Carolina. Included are (a) a flexible spatial arrangement of experimental rooms, (b) a grouping of the rooms into 3 independent units for the conduct of research with immature organisms of different ages and species, (c) central apparatus that controls the stimulating and recording equipment, (d) viewing areas that permit the observation of behavior in several rooms, (e) auditory intercommunication between all pairs of rooms, and (f) self-contained automated devices to aid the E or O in his tasks. These characteristics make the laboratories useful for a variety of studies.—*Journal abstract.*

2602. Green, Phillip C., Elliot, Lee, & Bancke, Linda. (Bowling Green State U.) **Age differences in information processing of an ambiguous learning task: Effect of varying information level.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 209-210.—1st graders and college students learned a 3-choice probability learning task. "Correct" responses were rewarded with either cents (juveniles) or money (adults). Information feedback (5, 10, 20%) and stimulus anticipation (AT = 2, 11 = 100, 60, 20%) were systematically varied. Results indicate (a) a direct relation between IF level and matching ability in both groups, (b) regression to chance below IF = 60, and (c) greater processing ability by juveniles at lower feedback levels and longer AT spans. It is concluded that 7 yr. olds can process ambiguous content about as well as adults if they receive a constant and sufficient information flow and their information carrying capacities are not overloaded.—*Author abstract.*

2603. Hall, Elizabeth. **A conversation with Jean Piaget and Bärbel Inhelder.** *Psychology Today*, 1970 (May), Vol. 3(12), 25-32, 54-56.—Piaget relates how his early interests in biology were applied to the study of

intelligence when he became convinced that most of the problems of philosophy were problems of knowledge and that most problems of knowledge were problems of biology. Another early indication of the direction of his later work was his interest in the concept of equilibrium when answering a standard intelligence test question who has cooperated with Piaget for over 30 years, and with him in suggesting that education should be organized by a greater concentration on developmental tasks and by helping children learn basic scientific concepts and activities before introducing the formal mathematical representations of these concepts.—*E. J. Poirier.*

2605. Khatena, Joe (Marshall U.) **Production of original verbal images by children between the ages of 8 and 19 as measured by the alternate forms of onomatopoeia and images.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 187-188.—Experiments designed to measure creative thinking occurring at the 4th and 5th grade levels relative to the production of original images as measured by Onomatopoeia and Images (a test of verbal originality). 280 boys and 261 girls from 4th and 5th grades served as Ss. Both forms of the instrument were administered at the ages of 10 and 15 or at about the 5th and 4th grade levels with differential rates of increase for boys and girls.—*Author abstract.*

2606. Kulsin, Sandra, Kulsin, Bertram, Pargament, Richard, & Bird, Henry (Rivera Research Inst., New York, N.Y.) **Children's social distance construct: A developmental study.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 151-152.—Developmental changes in children's concepts of the normative and personal social distance between the sexes and the races were assessed with a nonverbal measure for 4167 black and white boys and girls in Grades 1-12. So made judgments concerning the appropriate distances at which stimuli differing in race and/or sex should be placed from one another, and judgments concerning the appropriate distances between the self and others. Distances between the sexes decreased during adolescence. Distances between the races increased with age. Both self-other distances from white and black female stimuli changed markedly with age.—*Author abstract.*

2607. Latta, Luis M., Swartz, Jim D., & Holzman, Wayne H. (Texas Austin) **Human figure drawings by normal children over four years of repeated testing.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 167-168.—Studied human figure drawings of 1000 children longitudinally for the last 4 years of a long period of perceptual cognitive development. Boys grouped by age, male and female Ss were 7, 8, 9, 10, 11, and 12 years initially, and 11, 12, 13, 14, 15, and 16 years at the 4th study. Boys' drawings increased in size and detail. Girls' study was by age. Males' drawings increased in size and detail. Boys' drawings were more detailed than girls' drawings. Developmental changes in drawing were more marked for HFD scores. Sex differences were found. Drawing for HFD scores. Sex differences were found. Drawing for females at most ages. From 4 to 9 years of age, males' female figure 1st, males ranged from 78-97%. Females drawing same sex figures 1st decreased with age, but not

males. Correlations between Vocabulary and HFD scores for males increased with age. Highest correlations with HFD scores across age-sex groups were for Block Design.—*Author abstract.*

2608. Newton, Darren & Allen, Vernon L. (U. Wisconsin) Norm formation and social influence in children. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 157-158.—Investigated effect of a group decision on children's private acceptance across Grades 4, 7, and 10 with a total of 113 children. Experimental conditions either increased or decreased perception of individuals as a psychological group. It was predicted that group influence would increase directly with age in the condition of increased group awareness. Results confirm the prediction from the 4th to 7th grade, but not from Grade 7 to 10, possibly because of failure in the manipulation used to differentiate the conditions on group feeling. No difference among the 3 ages was observed in the condition of minimal psychological group formation.—*Author abstract.*

2609. Salamon, Jenő. (Eötvös Lóránd U., Budapest, Hungary) A megismerés és a cselekvés együttes átalakulása az ontogenezisben. [Joint changes of cognition and activity in the course of ontogenesis.] *Pszichológiai Tanulmányok*, 1967, No. 10, 339-343.

2612. Voronin, L. G., Kononov, V. F., & Serikov, I. S. (Inst. of Biophysics, Moscow, USSR) Dinamika formirovaniya i dilitel'nost' khraneniya sledovykh protsessov u cheloveka v ontogeneze. [The dynamics of the formation and the duration of storage of trace processes in human ontogeny.] *Doklady Akademii Nauk SSSR*, 1970, Vol. 195(6), 1468-1471.—52 5-17 yr. old Ss were presented with 50-70 sequences of sound and light stimuli of 3-sec duration each, separated by a 15-sec interval. Ss' task was to open their eyes when the light was turned on. In the course of the trials changes in Ss' GSR were measured 2 or 3 times as stimulus presentation was suspended. The results were: (a) the younger the S, the stabler the response to stimuli and to the ITI, and the longer the extinction process; (b) the younger the S, the faster a GSR to time was established; (c) the younger the S, the longer the duration of the stimulus trace. The observed age differences are explained in terms of changes in the inhibition-excitation processes, phasic-tonic reactions, and mobility of the nervous system.—*L. Zusne.*

INFANCY

2613. Banikiotes, Forence G., Montgomery, A. A., & Banikiotes, Paul G. (Elkhart Rehabilitation Center, South Bend, Ind.) Auditory reinforcement of infant vocalizations. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 135-136.—Studied differential effects of male and female auditory reinforcement on fundamental frequency and rate of infant vocalizations. 16 infants

participated in an experimental session consisting of 4 3-min stages; 2 base-line stages alternated with 2 conditioning stages. During base-line stages vocalizations were counted. During conditioning stages vocalizations were counted and reinforced by male or female voices. Although experimental procedures resulted in a significantly greater number of vocalizations from base-line to conditioning stages, no differences were found between conditions involving male and female auditory reinforcement. Fundamental frequency of vocalizations remained constant through all experimental stages.—*Author abstract.*

2615. Bower, T. G., Broughton, J. M., & Moore, M. K. (U. Edinburgh, Scotland) Infant responses to approaching objects: An indicator of response to distal variables. *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 193-196.—Infants (Ns = 21 6-20 day old Ss in Exp. I, 5 8-17 day old Ss in Exp. II, and 9 10-20 day old Ss in Exp. III) showed an adaptive avoidance response to approaching objects. The response was affected by the closeness and speed of approach. It was mediated by visual variables. Air-pressure changes did not elicit the response. This kind of response implies discrimination and response to distal variables rather than merely to their proximal mediators.—*Journal abstract.*

2616. Giblin, Paul I. The development of imitation in Piaget's sensory-motor period of infant development (Stages III-IV). *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 137-138.—Studied 16 white home-reared babies (8 boys and 8 girls) ranging in age from 6 mo. to 2 yr. during home visits. Piaget's sensorimotor development theory of imitation was employed, and his special thesis of the hierarchical sequence was tested. E proposed 4 criteria for assessing the development of imitation during this period: (a) accuracy of the imitation, (b) speed at which imitations are acquired, (c) complexity of imitation infant is capable of acquiring, and (d) novelty of the imitation. Findings conformed to the Guttman quasi-simplex correlation matrix, and demonstrated existence of a developmental sequence. Further investigations relating imitation during the sensorimotor period to application of measures of affective development are proposed.—*Author abstract.*

2619. Krebs, Richard L. (Sinai Hosp., Baltimore, Md.) Mother and child: Interruptus. *Psychology Today*, 1970(Jan), Vol. 3(8), 33.—On the basis of experience with 2 infants who woke up and cried when their mother became sexually aroused, it is speculated that the odor of the mother's milk disturbed the infants' sleep. This behavior has survival value since it postpones the next pregnancy.—*E. J. Posavac.*

2620. McKenzie, Beryl & Day, R. H. (Monash U., Clayton, Victoria, Australia) **Operant learning of visual pattern discrimination in young infants.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 45-53.—Studied visual discrimination of simple patterns by 6-12 wk. old infants. The appropriate direction of head turning to the patterns was developed and maintained by social reinforcement. Results show that visual discriminative control of the direction of head turning can be achieved. (20 ref.)—*Journal abstract*.

2621. Minard, James; Quick, Gary; Gory, Elliot, & McWilliams, Jun-Ko. (Maryland Psychiatric Research Center, Baltimore) **Polygraphically recorded rapid eye movement and reliably observable behavior obtained during sleep as indicators of neonate function: Effects of major tranquilizers and nursery noise.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 185-186.—Describes exceptions to previously reported patterning and day-to-day change in cumulative REM records of sleeping neonates. An infant lacking patterning had REM abolished by nursery noise and proved hyperactive. Marked day-to-day REM increase and absence of sleep-onset REM were observed in neonates of mothers given major tranquilizers during pregnancy. Related studies suggest nursery noise usually lacks marked effect on REM measures, absence of sleep-onset REM is unusual, and latency from lid closure to directly observed REM has convenience, reliability, and stability in neonate research.—*Author abstract*.

2622. Miranda, Simón B. & Fantz, Robert L. (Case Western Reserve U.) **Distribution of visual attention by newborn infants among patterns varying in size and number of details.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 181-182.—Size and number of details were varied both independently and simultaneously in an array of 6 stimulus targets for visual preference testing of newborn infants. Consistent preferences were shown for higher numerosity when size was controlled and for larger size when number remained constant, with a tendency toward prepotency of size over number preference when the 2 varied inversely as in commonly used "complexity" variations. Results question interpretations of previous studies as showing preference for simpler patterns by newborns and an increase in "optimal complexity level" or "information-processing capacity" with age.—*Author abstract*.

2631. Borton, Terry. (Philadelphia Board of Public Education, Pa.) **Dual audio television.** *Harvard Educational Review*, 1971(Feb), Vol. 41(1), 64-78.—Describes "dual audio television," a new medium designed to help young children learn significantly more factual information, concepts, and process skills while watching regular commercial TV broadcasts. It requires little technology and can provide each child with several thousand hr. yr. of instruction at negligible cost. A dual announcer would weave his commentary in between the verbal script and music of the commercial program and the child would receive it via his own inexpensive preset radio, equipped with a bug-in-the-ear private listening device. Preliminary experiments of promise are reported, practical and technical problems discussed, and procedures for further testing and implementation outlined.—C. Franks.

2632. Brophy, Jere E. & Lassa, Luis M. (U. Texas) **Effect of a male teacher on the sex typing of kindergarten children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 169-170.—To evaluate the effects of exposure to a male teacher, male-taught and female-taught kindergarten children were compared in a 2-yr. study. Measures taken involved sex typing in interests and preferences, mental ability patterns, sociometric play patterns, attitudes toward school and school objects, conceptual tempo, task persistence and level of aspiration. Few teacher sex effects were observed, and these were confined mostly to covert variables rather than

overt sex typed behavior. In general the results are consistent with Kohlberg's writings but not with predictions based on modeling or reinforcement theories.—*Author abstract.*

2633. Burnes, Kay. (National Inst. of Child Health & Human Development, Bethesda, Md.) **Clinical assumptions about WISC subtest score and test behavior relationships.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 299.—Administered the WISC to 40 white and 38 Negro 8-yr-old boys. The E and an O independently scored the S's behavior for attention, energy level, social skill, task persistence, and concern about performance. 13 clinical psychologists completed a questionnaire ranking behaviors considered important to performance on each of the WISC subtests. 15 hypotheses resulted, 8 involving attention and none involving concern about performance. Analysis of scores and ratings produced 8 significant relationships, 3 involving concern about performance. Emphasis on attention was found to be greatly overestimated. 16 correlations were significant for race and socioeconomic status. "Results indicate that (a) most of the clinically assumed relationships do not exist, and (b) the importance of test behavior to performance may vary among groups of children and tasks."—S. Knapp.

2634. Busch, John C. & DeRidder, Lawrence M. (U. North Carolina, Greensboro) **Note on control for intelligence in studies of field dependence with young children.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 337-338.—96 4.10-6.2 yr. old children from 6 Head Start Centers were administered the Rod and Frame and the Lorge-Thorndike Intelligence Tests. ϕ coefficients indicated that there was no relationship between intelligence and Rod-and-Frame scores for males and females separately or combined. It should not be necessary to control for effects of general intelligence in studies of field dependence with young Ss.—*Journal abstract.*

2635. Houston, H. S. **New directions: Research concerning early childhood.** *Delta, Massey U., New Zealand*, 1970(May), No. 6, 2-5.—Briefly describes the work of various behavioral scientists investigating growth and behavior in the early years of childhood. The progress of Project Head Start, the work at University of Illinois with mothers as teachers, and the work at Harvard by J. Kagan and by J. Bruner is reviewed. The psychological development of the young child and the different child-rearing techniques of various middle- and lower-class mothers are emphasized. The program of the Harvard School of Education's Pre-School Project, in which mothers have been placed into 1 of 5 categories on the basis of the mother-child relationship, is discussed. It is concluded that the significance of such work "cannot sensibly be overlooked by any group of educators ... concerned with the social and intellectual well-being of pre-school children."—R. Wiltz.

2636. Jamias, Maria F., Pablo, Renato Y., & Taylor, Donald M. (McGill U., Montreal, Quebec, Canada) **Ethnic awareness in Filipino children.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 157-164.—Investigated Filipino children's self-perception in terms of ethnic identity and assessed how accurately they recognized sketches of persons representing 2 important out-groups, i.e., Americans and Chinese. Each of the 90 Tagalog male Ss (6, 8, and 10 yr. old) was administered a picture identification test designed to assess Ss' ethnic affiliation. Results demonstrate that the frequency of identifying with an ethnic group increased with age and

that children identified more often with their regional group than with the national group. Ss were more accurate in recognizing Chinese pictures than those representing Americans, implying that accuracy of ethnic perception is related to the frequency of contact with the group.—*Journal summary.*

(National Center of Scientific Research, Paris, France) **Etude de morphogénèse graphique.** [A study of graphic morphogenesis.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(9-10), 512-520.—Presents an analysis of the evolution of obliqueness and circularity in children's drawings and tracings. Progressive coordination of horizontal and vertical movements of the arms resulted in the gradual change of a straight line to an oblique, to the development of the ellipse, and finally to the efficiently rounded curves necessary to produce true circles.—R. E. Smith.

2639. Matheny, Adam P. & Brown, Anne M. (U. Louisville, Medical School) **Activity, motor coordination and attention: Individual differences in twins.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 151-158.—Differences in temperament, attention span, and activity level as reported by mothers of 56 pairs of 12-mo-old twins were related to tested differences in cognitive abilities at age 4 yr. The more active twins were found to show temper more, have shorter attention span in play, and walk earlier but to have poorer manual dexterity than their co-twins. The twins with longer attention showed less temper and walked later but had better manual dexterity than their co-twins. Twins who were less active or had longer attention span at 12 mo. had significantly higher Wechsler Primary and Preschool Scale of Intelligence Performance IQs than their co-twins when tested at age 4 yr. Verbal IQ differences were in the same direction but not significant. (18 ref.)—*Journal abstract.*

2640. Meichenbaum, Donald H. (U. Waterloo, Ontario, Canada) **Implications of cognitive training research for educational television: Ways of improving Sesame Street.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 195-196.—The literature on cognitive training indicates that one strategy used to aid disadvantaged children to overcome serious language deficiencies is "verbal bombardment," which in many ways characterizes the "Sesame Street" format. A 2nd training strategy is an explicit tutorial language program whereby the child is taught to use language to overcome supposed comprehension, production, and mediation deficiencies. 3 studies are reported which indicate the efficacy of providing children with self-instructional training to moderate their performance and to tolerate failure by means of modeling and behavioral rehearsal. This research indicates the potentiality of modeling for thinking and cognitive strategies. The implications for educational TV cover such areas as explicit modeling of (a) self-instructions, self-reinforcement, and scanning strategies; (b) cognitive styles of reflectivity, creativity, and ways of coping with failure, delay of gratification; (c) interpersonal behaviors; and (d) Parent \times Child interactions.—*Author abstract.*

2641. Noelker, Robert W. (U. Cincinnati) **Reading**

ability and children's memory for sequence, form, and position. *Dissertation Abstracts International*, 1971-(Jan), Vol. 31(7-B), 4342-4343.

2642. **Orio, Stefania.** (State U., Pavia, Italy) **Influenza delle dimensioni affettive, economiche, culturali della famiglia sul livello di aspirazione.** [Influence of the affective, economic, and cultural dimensions of the family on the level of aspiration.] *Bollettino di Psicologia Applicata*, 1969, No. 91-93, 35-57.—Evaluated the influence of some aspects of family environment on 2 variables: the professional and scholastic aspirations of the preadolescent; and his expectation level. Level of expectation is defined as the degree of success which an individual tries to obtain in a definite task within a definite time period, and which requires an immediate solution. Level of aspiration is defined as the degree of accomplishment that an S hopes to attain over a long period of time in areas which directly influence his course of life. 294 11-13 yr. old Ss, representing all social classes were examined. Cassel's Level of Aspiration Test was used to evaluate the level of expectation, and the Ss' declarations were used for the level of aspiration, classified as low, average, and high, and then classified again into vague and definite. Family discipline was classified into (a) capricious, (b) indifferent, (c) rigid, (d) indulgent, and (e) mature. It is concluded that there is a relationship between family climate and structures and the levels of expectation and aspiration. (23 ref.)—*A. M. Farfaglia.*

2643. **Pizzo, Lucia; Renda, Salvatore, & Terrana, Liliana R.** **La rilevazione degli interessi in età evolutiva: Applicazione del Berufs Interessen Test: B.I.T.** [The emphasis of interest during the age of development: The application of the Career Interest Test (BIT).] *Bollettino di Psicologia Applicata*, 1969, No. 91-93, 97-128. Studied the problem of discovering the professional interests during the development age period. The Career Interest Test (BIT) was given to 180 elementary and secondary schoolchildren and to 200 adolescents who were apprentices. Statistical analysis shows that age, scholastic achievement, sociocultural family standards, and place of residence does influence interests. However, a deeper study of these statistics, through interviews and other information, shows that the data obtained through the test was unreliable. It is concluded that the BIT is reliable only if studied in conjunction with other detailed information of the Ss. (English, French, German, & Spanish summaries) *A. M. Farfaglia.*

2644. **Schroeder, Carolyn A. & Schroeder, Stephen R.** (U. North Carolina, Chapel Hill) **Decision conflict in children in a risk situation.** *Psychological Record*, 1970(Fal), Vol. 20(4), 457-463. Approach-avoidance conflict in 150 4th, 5th, and 6th grade boys was related to a risk situation where risk was defined as the relative magnitude of approach and avoidance tendencies. In this context, the risk was a specific win-lose ratio fixed by I. context, the risk was measured for each S on a series of decisions leading to a final decision to quit or play a game. Both win-lose ratio and incentive affected the number of Ss who quit playing and their trial of longest latency. (15 ref.)—*Journal abstract.*

2645. **Sinclair, Caroline.** (Richmond Public Schools, A Va.) **Dominance patterns of young children: A follow-up study.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 142.—Attempted to determine the change, if any, in hand, foot, eye, and ear dominance of young children after a 3-yr interval; the relationship of

dominance pattern to school success was also examined. 27 of the original 37 Ss were available for follow-up. Findings indicated stability in hand, foot, and eye preference after age 5 but some changes in ear preference. The relationships to school success were not significant. Further exploration of the concept of a dominance complex appears desirable. *Author abstract.*

2646. **Soualet, G.** (Lab. of the Psychology of Education, Bordeaux, France) **Quelques aspects de l'obéissance à la consigne à l'école maternelle.** [Some aspects of compliance with instructions in the kindergarten.] *Enfance*, 1970(May), No. 2, 203-214.—Ss consisted of 15 boys and 15 girls in each of 3 age groups: 3, 4, and 5 yr. old. They were asked to place 13 colored pieces in proper grooves on a spiral framework. Instructions implied, but did not specify, that the task was both to be completed and done correctly. Most Ss sought to complete the task but it was not until age 4 that correct performance became important. Successes increased with age but even in the older group only 53% were entirely successful. *S. S. Marzoli.*

2647. **Sutton-Smith, Brian; Lazler, Gilbert, & Zahn, Douglas.** (Teachers Coll., Columbia U.) **Age differences in dramatic improvisation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 421-422.—A review of the literature in child drama indicates that, unlike the study of children's art, there is no developmental account of improvisational phenomena. 3 improvisational tasks were presented to 34 7-12 yr. olds. Their responses to standardized instructions were recorded on videotape. When the younger (7-8 yr.) age group was compared with the older (9-12 yr.), they differed significantly in covering more space, stopping more often, creating more novel incidents, introducing more imaginary persons and showing more resistant acts to a 2nd player. Older children repeated more details thus giving a more clearly differentiated representation and a higher level of communication.—*Author abstract.*

2652. **Brigham, Thomas A.** (U. Kansas) **Effects of choice and immediacy of reinforcement on multiple-schedule and switching performances on kindergarten children.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3721-3722.

2653. **Campione, Joseph C., McGrath, Michael, &**

Rabinowitz, F. Michael. (U. Illinois, Children's Research Center) **Component and configurational learning in children: Additional data.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 137-139.—Tested 28 preschoolchildren with a 2-situational discrimination problem followed by a test series designed to assess whether components, configurations, or both were used to solve the original problem. 1 pair of stimuli differed in size, and 1 pair differed in color. It was found that whereas 25 of the Ss learned a component solution to the size pair, only 14 learned a component solution to the color pair. It is concluded that children of this age use both components and configurations within a discrimination problem and that the type of solution depends upon the dimension along which the stimuli vary. The relevance of the present findings to earlier work is discussed.—*Journal abstract.*

2654. **Cole, Lawrence E.** (U. Oklahoma) **Implicit associative responses in the verbal discrimination learning of children.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4357-4358.

2655. **Deichmann, John W., Speltz, Mary B., & Kausler, Donald H.** (Southern Illinois U.) **Developmental trends in the intentional and incidental learning components of a verbal discrimination task.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 21-34.—Investigated developmental trends in both the intentional and the incidental learning components of a verbal discrimination task. An inverse relationship between age and intentional verbal discrimination learning was found in 36 parochial school children from the 4th-6th grade levels in Exp. I and from the 3rd-6th grade levels in Exp. II with 160 public school children, in agreement with Weber's law presumed by frequency theory to be operative in verbal discrimination learning. However, speed of intentional learning increased from the kindergarten to 3rd (Exp. II) and from the 6th-8th (Exp. I) and 9th (Exp. II) grade levels. In both experiments there was a direct relationship between age and amount of incidental learning, and there was no evidence for the post-6th-grade decrement in Type 2 incidental learning reported in earlier studies. (18 ref.)—*Journal abstract.*

2656. **Denison, Joseph W.** (George Peabody Coll. for Teachers) **Relationship of auditory and visual perceptual strengths to methods of teaching a paired-associate task to first graders.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 218.—Auditory and visual tests were used to define proposed perceptual preferences for learning in a group of 1st graders. Paired-associate tasks were then presented visually and auditorily to assess the efficacy for learning of matching methods of presentation to such perceptual strengths. Results failed to support the predicted interaction between modality strength and learning facility. "Auditory learners" performed significantly better on the 2nd presentation of the task, regardless of modality of emphasis.—*Author abstract.*

2657. **Di Vesta, Francis J.** (Pennsylvania State U.) **The effects of connotative similarity in children's learning of a paired-associate task.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 35-44.—Assigned 60 5th-6th grade children to learn 1 of 10 paired-associate lists varied according to the number of word-pairs that were similar or opposite in connotative meaning. A mixed list (interference or unrelated) of word-pairs served as a control. All basic lists were

arranged with adjectives as stimuli and nouns as responses. All but the 2 lists representing intermediate degrees of oppositeness were arranged in the reverse order. Differences favoring the noun-adjective vs. the adjective-noun order of presentation were found for 1st-trial data only. Results indicate that Ss' learning of paired associates is directly related to the number of word-pairs in which the units share common connotative meanings. Opposites in which the dimensional relation, but not the polarization, is shared are learned more readily than a mixed list but with slightly more difficulty than a list in which word-pairs are similar. It is concluded that dimensional relationships or connotative meanings shared by stimuli and responses of a paired unit facilitate acquisition of a list. Results are discussed in terms of mediational processes.—*Journal abstract.*

2659. **Duke, Ann W.** (U. Nebraska) **Children's retention of a single item as a function of acoustic similarity to interfering items.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 13-22.—Tested predictions derived from W. A. Wickelgren's associative theory of short-term retention (see PA, Vol. 43:6871). Children recalled single phonemic CVC syllables which were presented in lists of other CVC items with either initial (CV) or final (VC) phonemic constancy. The single recall item was either similar to (i.e., shared the phonemic constancy) or dissimilar to the list items. In Exp. I with 96 4th grade children, recall did not vary with acoustic similarity or with the locus of the phonemic similarity. In Exp. II with 160 5th grade children, sources of interference were identified which differentially affected the recall of similar and dissimilar items. The absence of a similarity effect was related to these sources of interference. Results of Exp. II are discussed in terms of a multiple-associative theory of retention.—*Journal abstract.*

2662. **Haaf, Robert A.** (U. Toledo) **Cue and incentive motivational properties of reinforcers in children's discrimination learning.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 1-10.—Investigated 2 sources of interference in children's discrimination learning: reinforcer cue properties, e.g., size, shape, and texture; and reinforcer incentive properties, linked to preference value. The effects were studied in 84 2nd grade children by (a) comparing a condition in which S received the same type of reinforcer for all correct responses with 2 multiple reward conditions in which the reward varied from trial to trial between reinforcers differing in their cue properties, and (b) comparing reinforcers of equal preference value with those of unequal value. Results indicate that variation in both the cue and the incentive properties of rewards influences discrimination performance. Variation of reinforcer cue properties produced poorer performance than the single reinforcer condition. Where the occur-

rence of multiple rewards was correlated with irrelevant position cues, rewards of unequal, but not equal, preference value induced an interfering response strategy related to reinforcer-position contingencies.—*Journal abstract.*

2663. Jones, Sandra J. (National Inst. of Mental Health Bethesda, Md.) Children's two-choice learning of predominantly alternating and repeating sequences. *Journal of Experimental Child Psychology*, 1970 (Dec), Vol. 10(3), 344-362.—64 nursery and 64 kindergarten children guessed which of 2 lights would come on for 100 acquisition and 100 transfer trials. There were 4 groups in acquisition, differing in repetition probability (p_1) level (.1 or .9) and age. For transfer, p_1 was reversed for $1/2$ the Ss in each acquisition group, resulting in 4 groups at each age level. All Ss exhibited dominant response tendencies; nursery Ss tended to repeat their response, while kindergarten Ss tended to alternate theirs. Nursery Ss' responses were more dependent on event sequence than previous findings have indicated. While both groups were able to follow the highly predictable event sequence, kindergarten Ss followed both repeating and alternating patterns better than nursery Ss. For all Ss, a repeating sequence was easier to follow than an alternating one. Response tendencies established during acquisition were extremely resistant to change; except for 1 of the kindergarten groups, the effect of previous experience was not overcome in the transfer trials. It is suggested that kindergarten Ss performed better than nursery Ss because they were superior in response inhibition. Since a repeating response tendency requires fewer inhibitory responses than an alternating one, it is also suggested that a dominant response tendency is an indicator of the level of response complexity a child can handle when processing information. 2666 Lacher, Miriam R. & Hagen, John W. (Carlton Coll.) The relation of verbal and nonverbal encoding to serial recall performance in middle and lower class children. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6 (Pt. 1) 191-192. Investigated effects of lower vs middle-class parental occupation, verbal intelligence, and action content of pictured stimuli upon nonverbal serial recall in white 1st graders attending a semirural elementary school. An Occupation \times Intelligence interaction was found no main effects. Recall was higher for pictured static objects than for actions, and higher for objects in action than for faces and activities. A Class \times Intelligence interaction with action content supported the underlying cognitive-developmental theory while suggesting that intelligence is a better predictor than occupation in a small integrated community. Assumptions about encoding processes were explored using children's verbal and action labels on a classification report. *Author abstract.*

2667 McManus, Marianne. (Iowa State U.) Effects of systematic response biases on concept learning. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol 66 Pt 1b, 193.

194. —45 preschool children were administered 18 blank trials prior to the discrimination problem. Significant level ($p < .01$) response biases for stimulus size and position were exhibited by 10 of the Ss. So who evidenced the response biases on the blank trials measure did not require significantly fewer trials to learn the discrimination problem than Ss who had responded randomly. A trend was noted for So who had demonstrated most consistency in their response bias previous to learning to require fewer trials to learn the discrimination problem ($p < .08$). Results are interpreted in the light of the response bias model. (Author abstract)

2668. Moffat, Gene H. & Miller, Frank D. (Southern Mississippi) Effect of pretraining and instructions on avoidance conditioning in preschool children. *Journal of Experimental Psychology*, 1966, Vol. 11(4), 133-138. --Studied 70 preschool Ss in a discrete trial instrumental avoidance conditioning task. Omission of response during a 10 sec. interval was followed by 10 sec. served as the aversive event. A light was presented 3 sec. prior to the omission interval. 3 experimental groups and 2 control groups in which the light was never omitted were established. One control group received explicit instructions and the other received pretraining procedures. Learning to escape the aversive response is the criterion. Explicit instructions for better avoidance performance. The explicit instructions required reach criterion as compared with the pretraining group. The experimental and control groups did not differ significantly.

2669 Moffat, Gene H. & Moffat, James P. (Southern Mississippi) Effectiveness of different verbal reinforcement combinations on a discrimination reversal problem in children. *Psychological Review* 1970(Dec), Vol. 21(6), 351-353. — Preschool (47) & 2nd old nursery school and kindergarten children with a discrimination reversal task involving a right-blank (Rb), wrong-blank (Wb), or right-wrong (RW) verbal reinforcement condition. The discrimination problem performance in the Wb and RW conditions was similar and superior to performance in the Rb condition. The reversal problem indicated that in the Wb condition older 5s reversed faster than younger 5s and that younger 5s reversed faster in the RW condition than in the Wb condition. Results are consistent with the earlier conclusion that the Rb condition is more difficult than the Wb condition. (19 ref.) *Journal abstract*

2021 Nicki R M & Shea J J 1 New H...
[redacted] Canada Learning, curiosity, and social

group membership. *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 124-132. Presented 80 middle- and lower-class schoolchildren a series of 20 question-alternative answer items. The alternative answers associated with each question were varied in number and relative probability in order to obtain 4 degrees of objective uncertainty. Using the Shannon-Weaver average information measure, these were calculated to have .9165, 1.5849, and 2.3219 bits of information. Recall of the correct answers, provided after each question-alternative answer item, was tested after all 20 items were presented. Recall of correct answers was found to be an inverted U-shaped function of objective uncertainty. Differences in recall between middle- and lower-class Ss lessened for intermediate and high degrees of objective uncertainty. (20 ref.)—*Journal abstract*.

2672. Northman, John E. & Black, Kathryn N. (State University Coll. New York, Cortland) **Ontogeny of visual and haptic-tactual information processing.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 171-172.—Gave 96 kindergarten, 3rd grade and 6th grade Ss preference and memory tasks in the visual and haptic modalities using random forms as stimuli. Visual memory was found to be superior to haptic memory at all grade levels. Additional analyses indicated differences between modalities in the types of errors made. There was no relationship between memory for visual and haptic stimuli. Ss explored longer in the haptic modality on both preference and memory tasks. Although there was consistency across tasks for exploration time, there was no significant relationship between time on the preference task and performance on the memory task.—*Author abstract*.

2674. Resnick, Lauren B., Siegel, Alexander W., & Kresh, Esther. (U. Pittsburgh) **Transfer and sequence in learning double classification skills.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 139-149.—Trained 27 kindergartners on 2 different double classification matrix tasks in an attempt to determine whether the tasks were hierarchically related. Prior behavior analyses of the tasks suggested that the 2 tasks shared many components, but that the more complex task had additional components not included in the simpler one. It was predicted that learning the simpler task and then the complex, was the "optimal" learning sequence. As predicted, Ss who learned the tasks in the optimal order learned the more complex task in fewer trials than Ss who learned the tasks in the reverse order. Ss in the reverse order group who did succeed in learning the complex task showed evidence of having acquired the simpler task in the process. Findings support the hypothesis that the 2 tasks are hierarchically related. It is suggested that acquisition of complex cognitive skills may be a matter of learning specific relevant prerequisites.—*Journal abstract*.

2675. Rosner, Sue R. (U. Iowa, Inst. of Child Behavior & Development) **The effects of rehearsal and chunking instructions on children's multitrial free recall.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 93-105.—Examined age differences in multitrial free recall. 3 instructional conditions were given to 180 1st, 5th, and 9th grade children: (a)

standard instructions; (b) overtly rehearse during picture presentation; (c) "chunk" the items by establishing mediational links. Recall, organization, and S-units (subjective groupings) increased with grade. At the 1st grade level, type of instruction had no effect on recall or organization but S-units increased under chunking instructions. All performance measures, at the 5th grade level, were facilitated by chunking instructions. An adultlike performance pattern, a slight improvement under chunking instructions, and a small decline with rehearsal instructions, was obtained at the 9th grade level. The relation between age and memory mechanisms, and the productional, mediational, and retrieval aspects of children's organization are discussed. (24 ref.)—*Journal abstract*.

2676. Weisberg, Robert W. (Temple U.) **Semantic factors in the storage of sentences in children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 53-54.—Assessed sentence storage in children using a recognition procedure. 78 5th and 6th graders heard a training list of 10 active, passive, and negative sentences and then a test list of 30 sentences—the original 10 plus 20 transformationally related to the original 10. Maximum confusion resulted when the training sentence had been active and the test sentence was its passive, or vice versa. There was little confusion from either the actives or passives to negatives or vice versa. Results support those of other studies which indicate that semantic interpretation is stored, rather than formal aspects of a sentence.—*Author abstract*.

2678. Barragy, Micheleen. (George Peabody Coll. for Teachers) **The effect of varying object arrangement and number on children's ability to coordinate perspectives.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2730.

2679. Bartholomeus, Bonnie N. & Doebring, Donald G. (McGill U., Montreal, Quebec, Canada) **Development of naming responses to meaningful nonverbal sounds.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 195-204.—Tests of sound and picture naming were presented to 118 3¹/₂ to 16 yr. old Ss to assess perceptual development for meaningful nonverbal sounds and to compare nonverbal visual and auditory perception. Sound naming improved rapidly until the 9th yr., did not differ significantly between boys and girls, and was positively correlated with the frequency of usage of the stimulus names. Virtually all Ss were poorer in sound naming than in picture naming. It is concluded that nonverbal visual stimuli may be more salient than nonverbal auditory stimuli in the perceptual world of children. Results were interpreted with respect to the concept of modality dominance. (22 ref.)—*Journal abstract*.

2680. Beaudichon, Janine & Forestier, Marie F. (U. Paris at the Sorbonne, Lab. of Genetic Psychology, France) **Facteurs de l'efficacité de la communication entre enfants: La perceptibilité du stimulus.** [Factors affecting the efficiency of communication between

children: Perception of the stimulus.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(9-10), 575-582.—Analyzes the ability of children of kindergarten and primary levels (ages 6.5-7.7 yr.) to communicate the solution of a problem to each other as to method and effectiveness. The problem involved making colored water flow to a particular point in a labyrinth built of glass tubing by manipulating a series of valves. Although demonstration alone by a child was at times effective in teaching the solution to another child, verbal interaction between them produced quicker learning and more frequent generalization to similar problems. Older children, because of greater verbal skills, were more effective teachers.—*R. E. Smith.*

2681. Beiswenger, Hugo. (St. Lawrence U.) **Linguistic and psychological factors in the speech regulation of behavior in young children.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 63-75.—Gave 48 3-4½ yr. old children 2 sets of commands. Set I commands compared conditional and unconditional responding to a random sequence of visual signals. Ss found all of the series-conditional commands difficult and the series-nonconditional ones easy. There was an age-correlated increase in ability to perform both sets. Differences in performance on Set I commands were found in some cases to be a function of the complexity of the psychological processes required to organize a plan of action corresponding to the content of the command. A Set II command which required the mental transforming of the spatial relationship of a target and instrumental action of the command itself to an opposite spatial relationship in behavior could not be performed by 83% of all Ss, while the same command, with a paratactic syntax (no mental spatial reversal required) was performed by 86% of the same Ss. 2685. Elardo, Phyllis T. (U. Arkansas, Center for Early Development & Education) **Effects of multiple discrimination and concept training on the optional shift performance of four-year-old children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 189

190.—An examination of studies which explored the effects of verbalization training on 4-yr-old children's performance with optional shift problems revealed that previous procedures had merely required children to label various stimulus objects. The present experiment provided 24 4 yr. olds with much more complete verbalization training than in the past; however, it was found that although children learned to describe verbally the concepts apparently relevant for problem solution, they did not register significant gains in reversal responses on the optional shift problem. This finding, therefore, lends support to the theoretical positions of the Kendlers, Luria, Jensen, and Bruner.—*Author abstract.*

2688. Gresson, Larry F. & Jacobson, Leonard I. (U. Miami) **Effects of modeling language units of differing complexity on the language acquisition of preschool black children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 197-198.—Investigated the effects of the modeling of 5 linguistic response classes and information complexity on language usage in preschool Negro children from poverty backgrounds. It was found that the modeling of simple language units, comprised of single sentences, resulted in more effective language acquisition than the modeling of complex language units, comprised of groups of sentences. In addition, particular categories of language usage were influenced significantly more than others as a result of the simple language units treatment. Thus, the effects of information complexity and the specific characteristics of modeled stimuli significantly influence the effectiveness of modeling as a method of language learning.—*Author abstract.*

2689. Hamsber, J. Herbert. (U. Rochester) **Children's understanding of emotions and interpersonal causality.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 159-160.—Developed a story-telling technique to assess the abilities of children to perceive, interpret, and explain emotional-interpersonal reactions and behaviors. The method involved 12 pictorially presented situations in which a child was depicted as confronted with an emotionally provocative stimulus and was then seen interacting with others. Ss explained the way they interpreted the story and how the others in the story perceived the "hero's" behavior. Stories were scored for level of sophistication in dealing with affective-causal relationships. Data from 81 children (ages 6-13) indicate that the technique is a useful approach to the study of a significant developmental dimension and that the dimension is separable from intelligence.—*Author abstract.*

2690. Hecox, Kurt E. & Hagen, John W. (U. Michigan) **Estimates and estimate-based inferences in young children.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 106-123.—Examined the ability of children to perform in estimation-based inference tasks. In Exp. I, 52 5-7 yr. old children were tested for their ability to make increasingly accurate estimates of proportions as a function of CA. It was

found that there was above-chance level performance at all CA levels and that performance improved as a function of CA. In Exp. II with 41 6-8 yr. old children, measures of the ability to make quantitative inferences were studied. It was hypothesized that: (a) performance would be above-chance level at all ages; (b) inferential performance would improve with increasing CA; (c) conservatism, defined as the constriction of responses to the middle of the response scale, would vary inversely with performance level; and (d) attention strategies would be a significant determinant of performance. All of the hypotheses except b were supported. Results are discussed in terms of cognitive models and it is concluded that accurate but nonlogical modes of inference operate in the performance of children within the CA range tested.—*Journal abstract.*

2707. Henderson, N. B., Butler, B. V., & Clark, W. M. (U. Oregon, Medical School) Relationships between selected perinatal variables and seven-year intelligence. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 139-140.—Race and mother's occupation correlated significantly ($p < .01$), but not birth weight, Apgar, type of delivery, cord around neck, toxemia, or meconium staining with WISC IQ. Perinatal variables rendered a multiple correlation of .34 with IQ. Though multiple R was highly significant ($p < .001$), variables accounted for only 11.4% of IQ variance. Possible explanations for limited contributions are: homogeneous sample; excluding some, and using infrequently occurring variables; tabulating system; measurement units and cut-off points; examiner "bias"; sample loss; no correction for death; intelligence criterion; predictor curvilinearity; concentration on immediate threat conditions; and some

conditions ameliorated by intervention, and normal growth and learning.—*Author abstract*.

2708. Longeot, F., Girard, P., Lambert, J. L., & Rouquier, C. (U. Grenoble, Inst. of Psychology, France) Etude comparative de la nouvelle échelle métrique (Binet-Simon) et de l'échelle de développement de la pensée logique. [Comparison between the new Metric Scale (Binet-Simon) and the Scale for the Development of Logical Thinking.] *Bulletin de l'Institut National d'Etude du Travail et d'Orientation Professionnelle*, 1970(Sep), Vol. 26(4), 219-237.—Both scales were applied to 96 9-11 yr. old French children. Results of the Binet-Simon were interpreted in terms of operational theory of intelligence based on Piaget and Inhelder. Stages were demonstrated by hierarchical analysis. The linear correlation between MA and the operational score was .65, and the rank-order correlation between IQ and operational score was .54, both highly significant.—M. G. Stroebe.

2711. Selman, Robert L. (Harvard U.) Conceptual role-taking development in early childhood. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 155-156.—60 middle-class Ss (10 boys and 10 girls at each of ages 4, 5, and 6) were administered a role-taking task specifically designed to enable the S (role-taker) to make and explain predictions about a peer's responses in a situation in which S has information not available to the peer. Results suggest a 4-level progression in role-taking skill across the age-range examined. The significant correlation between CA and the role-taking levels supports the hypothesis that conceptual role-taking is an age related social-cognitive skill and implies the possible existence of an ontogenetic sequence of role-taking stages.—*Author abstract*.

Perception

2713. Asso, Doreen & Wyke, Maria. (U. London, Goldsmiths' Coll., England) Discrimination of spatially confusable letters by young children. *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 11-20.—Studied the ability of young children to discriminate spatially confusable letters using 4 different methods of discrimination. Ss were 31 5.6 6.10 yr. old English children. Results show that the accuracy of discrimination of spatially confusable letters is dependent upon the method of assessment employed. The highest accuracy was achieved with copying confusable letters from a given sample. The method that required matching a given letter with other possible alternatives was next. Naming the confusable letters and writing them in response to dictation were the most difficult tasks to perform. A significant correlation between individual performances in the matching, naming, and

writing to dictation tests was found; but in the copying task individual performances varied independently of the performances in the other tests.—*Journal abstract.*

2716. Faw, Terry T. & Leftgoff, Shelly. (U. California, Los Angeles) **Influence of affective value on children's patterns of visual selection.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 177-178.—Examined the influence of stimulus affective value on the visual selection of 23 4.4-6.5 yr. old females using a seminatural experimental setting. Whereas earlier studies have found that for adults a monotonic function best describes the relationship between stimulus affective value and dominance in visual selection, the present study suggests that children seek out and attend to both positive and negative stimuli. Results are discussed in light of various models of visual selection, and their implications for an understanding of human development are examined.—*Author abstract.*

2718. Koenigsberg, Riki S. **Evaluation of procedures for improvement of orientation discrimination in preschool children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 183-184.—Previous researchers have indicated that 4-6 yr. old Ss have great difficulty in discriminating orientation, although some studies have shown improvement following brief training. 2 experiments were conducted with middle-class children in this age range to pinpoint the sources of difficulty and to determine the best methods for improving orientation discrimination. Results indicate that children 4 and 5 can discriminate orientation, when they are informed through demonstrations that orientation is to be considered relevant. The demonstrations featured a standard which could be rotated to illustrate the relationships between forms differing in orientation.—*Author abstract.*

2719. Locke, John L. (U. Illinois) **Phoneme perception in two- and three-year-old children.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 215-217.—20 2- and 3-yr-old Ss were given a phoneme perception task in which they were to point to 1 of 2 pictures whose labels differed by minimally discriminable phonetic features. Results suggest that (a) picture identification testing can be used successfully to test phoneme perception in Ss as young as 2 yr., (b) place-of-articulation cues are not difficult for young children to distinguish, and (c) children's acquisition of expressive phonology must not be wholly dependent on their ability to process phonetic cues from the environment.—*Journal abstract.*

2721. McWhinnie, Harold J. (U. Maryland) **A third study of the effects of a learning experience upon preference for complexity-asymmetry in fourth, fifth, and sixth grade children.** *California Journal of Educational Research*, 1970(Nov), Vol. 21(5), 216-225.

—Investigated the effects of a specific type of perceptual learning upon esthetic preference, the ability to handle visual information, and selected variables of cognitive style and perceptual field independence. 249 4th, 5th, and 6th graders participated in an experiment of 10-wk duration. A limited number of significant differences were found between pretest and posttest data, however, it was concluded that perceptual learning in art in relation to selected behavioral variables did in fact seem to be possible. A number of changes in research design, nature of the instructional treatment, and tests used to measure the results are suggested before any replication ought to be contemplated.—*Author abstract.*

2723. Quina, Kathryn & Pollack, Robert H. (U. Georgia) **Ponzo figure: One or two illusions?** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 175-176.—Presented the test line of a tachistoscopically presented Ponzo figure at 2 positions relative to the apex of the wedge to children in Grades 2, 4, 6, and 8. Near the apex the test line was overestimated and at the open end it was underestimated for all ages. The effect at the apex decreased with age, and at the open end it increased with age. Results are discussed with reference to assimilation and contrast processes which seem to produce 2 separate illusions.—*Author abstract.*

2724. Schneiderman, Della Z. (Brooklyn Coll., City U. New York) **Tactile-visual perception and cross-modal transfer.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 159-162.—Observations of 12 young children (age range, 2.1-6.6 yr.) suggested that by age 4 they were able to match tactually seen objects and to match visually objects explored tactually.—*Journal abstract.*

2725. Sjöstrom, Kristen P. & Pollack, Robert H. (U. Georgia) **Simulated receptor aging in the study of ontogenetic trends of visual illusions.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 173-174.—A Type I (Delboeuf illusion) and Type II (Usnadze effect) illusion was viewed both through and without a yellow filter by Ss from Grade Levels 2, 5, and 8. The effects of the filter were to simulate receptor aging by decreasing the visual sensitivity of the Ss. The magnitude of the Type I illusion decreased at all age levels when viewed through the filter, but the magnitude of the Type II illusion did not change. Results are interpreted as indicating different mechanisms producing the ontogenetic trends of the visual illusions.—*Author abstract.*

2727. Winters, John J. & Baldwin, David. (E. R. Johnstone Training & Research Center, Bordentown, N.J.) **Development of two- and three-dimensional size constancy under restricted cue conditions.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 113-118.—160 Ss (4 groups of children and 1 group of adults) judged the sizes of pairs of circles in 2- and 3-dimensional (2- and 3-D) displays under restricted cue conditions. The cue of vertical intersection was either included or excluded. It was found that size constancy in the 3-D display already exists by 4 yr. old, and develops

further between the ages of 6-10 yr. old. No size constancy, nor differences in the judged location of the circles, was found in the 2-D condition. The cue to vertical intersection had some influence on young S's judgments in the 3-D condition, and strongly affected adults' judgments in the 2-D condition.—*Journal abstract.*

2729. Breskin, Stephen & Rich, Kenneth D. (New York State Psychiatric Inst., New York) **Correlation of non-verbal rigidity and intelligence in elementary school children.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 194.—An R of $-.106$ ($N = 143$ elementary schoolchildren) was obtained between a brief measure of rigidity (the Breskin Rigidity Test; BRT) and intelligence (IQ based on the Kuhlmann-Anderson Test). This value is consistent with the assumption that the BRT is unrelated to intelligence.—*Author abstract.*

2730. Cameron, Paul & Janky, Christine. (U. Louisville) **The effects of TV violence upon children: A naturalistic experiment.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 233-234.—To explore the possible effects on children of viewing violence on TV, 254 kindergartner's TV viewing while-at-home was controlled by their parents over a 3-wk period. After division by sex, Ss were randomly assigned to 4 conditions: (a) 3 wk. of violent TV, (b) 2 wk. of violent followed by 1 wk. of passive TV, (c) 2 wk. of passive followed by 1 wk. of violent TV, and (d) 3 wk. of passive TV. Parents were interviewed after each of the 3 wk. and after the conclusion of manipulation. Parentally-reported behavioral changes were weighed and t tests between the groups performed. Generally, although all 4 groups tended to become more pathologic, children on a violent TV diet displayed more behaviorally-pathologic changes than those on the passive diet.—*Author abstract.*

2731. Doris, John; McIntyre, Anne; Kelsey, Connie, & Lehman, Ellen. (Cornell U.) **Separation anxiety in nursery school children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 145-146.—Parental ratings of 60 3 yr. olds' proneness to separation anxiety prior to nursery school entrance correlated .70 with teachers' ratings of observed separation anxiety during the 1st 2 wk. of school. In subsequent wk. mean teachers' ratings dropped from initially high levels but remained significantly correlated with parental ratings.—*Author abstract.*

2732. Eysenck, Sybil B. & Eysenck, H. J. (Maudsley Hosp., Inst. of Psychiatry, London, England) **"Psychoticism" in children: A new personality variable.** *Research in Education*, 1969(May), No. 1, 21-37.—Hypothesized that "there exists a dimension of psychotic predisposition, quantitative in nature and independent of neuroticism and extraversion" which can be measured in children. The Neuroticism (N), Extraversion (E), and Lie (L) scales of the Junior Eysenck Personality Inventory and 35 potential Psychoticism (P) items were administered to 486 11-15 yr. old girls and boys from a comprehensive school in the north of England. "Principal component analyses were carried out on the

product-moment intercorrelations between N, E and P items for the boys and girls separately; because of limitations on numbers of items simultaneously analysed the L items had to be excluded." Results indicate the independence of the P items from the others: "for both boys and girls 3 factors similar to the hypothesized N, E and P have emerged, though not without some unexpected changes of items from 1 factor to another." The psychological traits underlying the P items are described. The text of the 95-item scale is presented. (33 ref.)—S. Knapp.

Genoa, School of Medicine & Surgery, Italy) **Le origini del sentimento di inferiorità nel bambino.** [The origins of inferiority feelings in the child.] *Neuropsichiatria*, 1968(Oct), Vol. 24(4), 715-727.—Inferiority feelings are less frequent and intense in preschool years than in successive stages. Inferiority feelings with pain and hurt are usually accompanied by introversion, timidity, and difficulties in socialization. Growth models are seen in older children rather than in adults. Extreme feelings of inferiority are derived from debasing familial conditions. (French, English, & German summaries) (29 ref.)—L. L'Abate.

2739. McCall, William P. (U. South Carolina) **A**

double-blind study of inquisitive behavior (curiosity) in children. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4316.

2740. Mikawa, James K. & Boston, John A. (U. Nevada, Psychological Service Center) **Psychological characteristics of adopted children.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 274-281.—20 normal nonadopted children were compared to 20 normal nonrelated adopted children on a number of personality dimensions. No significant differences were found between the 2 groups on any of the measures used. (31 ref.)—D. Prager.

2741. Miller, Thomas W. (Child's Aid of Buffalo, N.Y.) **Communicative dimensions of mother-child interaction as they affect the self esteem of the child.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 241-242.—Explored the effects of verbal and nonverbal parental behavior on the self-esteem of the child by means of a stratified random sampling of schools in a large metropolitan area in the northeastern United States. Ss were 203 8th grade level children and their mothers representing a wide range of educational, social, and ethnic backgrounds. Measures to assess verbal response patterns of mothers and the self-esteem of the child yielded the following results. A significant relationship existed between maternal descriptiveness in negative situations and the self-esteem of the child. Significant differences were observed between the inner-city black sample and suburban white sample. Measures to assess nonverbal parental behavior and its effects on the self-esteem of the child indicate a significant relationship between maternal empathy, genuineness, and positive regard toward the child and his level of self-esteem. Theoretical support, cultural differences, and application and import for future inquiry are discussed.—*Author abstract*.

2742. Perczel, Tamás & Völgyesi, Pál. **Az agresszív magatartásmód komplex jellege, differenciálhatósága, különös tekintettel a társadalmi hatások személyiség alakító jellegére.** [The complex nature and differentiability of aggressive behavior, with special regard to personality moulding by social effects.] *Magyar Pszichológiai Szemle*, 1969, Vol. 26(3-4), 503-519.—Studied 68 10-14 yr. old girls in a state institution. The emergence of aggressive tendencies was attributed to social conditions. (English & Russian summaries)—M. Moore.

2743. Price, Frank T. (Wayne State U.) **Some effects of film-mediated professional models on the self-perceptions of black school children.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4318.

2744. Singh, Udai P. & Akhtar, Syed N. (Bhagalpur U., Bihar, India) **The Children's Apperception Test in the study of orphans.** *Psychology Annual*, 1970(Mar), Vol. 4, 1-6.—Administered an Indian adaptation of the Children's Apperception Test (CAT) to 24 6-10 yr. old orphan boys. Results are descriptive rather than interpretive and indicate (a) identification with a male figure, (b) high interest in food, (c) need for acquisition and affiliation, (d) perception of the environment as hostile, (e) anxieties concerned with physical harm and punishment, and (f) severe superegos. Although the stories were unoriginal, indicating a lack of imagination and constructive intelligence, they were generally realistic and appropriate, indicating good ego integration. The large number of incomplete and stereotyped stories and

the low maturational development which is indicated suggest that Ss were poor in intellectual and self-development. Findings are discussed in terms of conditions in Indian orphanages and the background of the children.—S. Knapp.

2745. Todd, Gibson A. (U. Denver) **A developmental study of perceptual factors in color-affect arousal.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4374.

2746. Zlotowicz, Michel. **Origines et perspectives de quelques recherches sur l'anxiété.** [Origins and perspectives in some research on anxiety.] *Enfance*, 1970(May), No. 2, 113-171.—Reviews research and theory related to 3 definitions of anxiety: the clinical (Freud), the situational (Binet), and the experimental (Watson) with respect to their applicability to the study of anxiety in children. Covers questionnaires, which arose out of the work of Binet (Taylor, Sarason), factor analysis (Cattell), and conditioning (Mowrer and Miller). Concern with methodology and the development of a pure scale has subordinated attention to such issues as the intensity of affect and its development in infancy and those dealt with by Bowlby. Greater use should be made of open-ended inquiries and systematic yet naturalistic observation. (3 p. ref.)—S. S. Marzolf

Social Behavior

2747. Benton, Alan A. (U. Illinois, Chicago) **Productivity, distributive justice, and bargaining among children.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 68-78.—Examined the attitudes and bargaining behavior of 96 9-12 yr. old boys and girls with respect to the division of rewards following differential productivity. Same-sex pairs of friends, nonfriends, and neutrals were constituted, and 1 member in each pair passed a reading test which made toys available for play. Results indicate that (a) when paired with a friend or nonfriend, successful boys found allocations which favored themselves more acceptable and an equal allocation less acceptable than did boys who failed; (b) passing and failing boys paired with a neutral other chose allocations which favored themselves; (c) both successful and unsuccessful girls paired with a mutual friend or neutral other gave highest acceptability ratings to an equal division; (d) girls resolved the bargaining problem, which did not permit an equal division, by agreeing to an equity solution more often than did male pairs; and (e) the preferences and bargaining outcomes of girls paired with nonfriends were similar to those of male friends and nonfriends. Content-category analysis of the bargaining sessions revealed differences between experimental conditions, particularly between female friends and nonfriends. Results are explained in terms of differences in the typical socialization experiences of males and females.—*Journal abstract*.

2749. Harrison, Murelle G., Messé, Lawrence A., & Stollak, Gary E. (Michigan State U.) **Effects of racial composition and group size on interactional patterns in preschool children.** *Proceedings of the Annual Convention of the American Psychological Association*,

1971, Vol. 6(Pt. 1), 325-326.—Previous research has indicated that preschool-aged children are aware of racial differences, but this awareness does not affect their interaction in mixed-race groups. The present study extended this work by comparing 2- and 4-person homogeneous and racially mixed groups of 3½-5 yr. old children. Results indicate that the frequencies of initiations and negative responses were lower in 4-person racially mixed groups than in 4-person homogeneous groups. Also, the ratio of responses in general to initiations was lower in mixed groups than in homogeneous groups. Thus, racial awareness was found to inhibit social behavior.—*Author abstract.*

2750. Heider, Eleanor R. (Brown U.) **Style and accuracy of verbal communications within and between social classes.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 33-47.—Reports 2 experiments in isolating social class differences in language which actually affect interpersonal communication. 143 10-yr-old middle-class white, lower-class white, and lower-class Negro boys and girls encoded (described) abstract and face stimuli from sets of 6 similar items, so that "another child" could pick out that item at a later time. Consistent class differences of encoding style were found. Ss were recalled and asked to decode examples of the different styles of description given by each class and sex of S. For each class, the most successfully decoded style was the class' preferred encoding style. Overall, middle-class Ss were superior encoders and decoders. There was no evidence of overall greater within- than between-class accuracy. There were no consistent sex or race differences. (37 ref.)—*Journal abstract.*

2751. Jones, Reginald L. & Sisk, Dorothy. (U. California, Riverside) **Early perceptions of orthopedic disability: A developmental study.** *Rehabilitation Literature*, 1970(Feb), Vol. 31(2), 34-38.—A cross-sectional study was made of the development of perceptions of orthopedic disability. Ss were 230 non-disabled children who responded to either a drawing of a child of his own sex that included leg braces (orthopedically disabled) or a drawing of an identical child without braces. All Ss responded to a set of standard questions designed to tap interpersonal acceptance and an understanding of limitations imposed by orthopedic disability. 5 yr. olds rejected the drawing of the orthopedically disabled child with greater frequency than the drawings of the nondisabled on the question "Would you play with him?" 4 and 5 yr. olds perceived the disabled as less likely to have fun at a carnival than the nondisabled, and 5 and 6 yr. olds frequently qualified their responses by indicating the conditions under which they believed the disabled would have fun or be acceptable, a finding which held for the responses of 5 and 6 yr. olds in general. 4 was revealed as the age at which perceptions of the limitations imposed by physical disability appeared with consistency.—S. L. Warren.

2752. Liebert, Robert M. & Poulos, Rita W. (State U. New York, Stony Brook) **Eliciting the "norm of giving": Effects of modeling and the presence of a witness on children's sharing behavior.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 345-346.—A 2 (presence or absence of a witness) × 4 (no modeling and modeling with 3 types of verbalizations) factorial design was employed to examine further the elicitation of sharing

behavior by children. The presence of a witness and observation of a sharing exemplar each increased (a) the magnitude of the sharing displayed, and (b) the percentage of children who shared. Also as anticipated, these variables appeared to act in an additive fashion for both dependent measures. However, contrary to prediction, modeling effects were not influenced by the exemplar's verbalizations either in the presence or in the absence of a witness. The overall pattern of results is discussed with respect to the central importance of informative social cues in determining children's sharing.—*Author abstract.*

2753. Mueller, Edward & Rebersky, Freda. (Boston U.) **Origins of success and failure in children's spontaneous communication.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 152-153.—The view of preschool child as egocentric or incompetent in communication skills suggests that their spontaneous verbal interaction would be impaired. However, a direct examination revealed that 4 yr. olds almost always displayed social interest and usually received replies to the things they said in free play. The maintenance of verbal interaction was found to be multidetermined; however when many causative factors operated in 1 direction the outcome was perfectly predictable. The 2 most powerful predictors of whether or not a given message would receive a reply were its technical quality and the visual attention of the listener at its beginning.—*Author abstract.*

Parent-Child & Family Relations

2757. ———. **Psychosexual development.** *British Medical Journal*, 1970(Feb), Vol. 1(5692), 319-320. Reviews recent studies on the part which parents play in the psychosexual development of their children. Most studies have been concerned with homosexuality, which is the most common sexual deviation. D. J. West found that male homosexual inpatients had recalled significantly more than a control group of neurotics an overintense relationship with their mothers and an unsatisfactory relationship with their fathers. Other studies have confirmed this. Deviations besides homosexuality have been studied. It is suggested that the findings be interpreted with caution. Cautious preventive measures are nevertheless justified.—S. R. Diamond.

2758. Burger, Gary K. & Armentrout, James A. (St. Louis U.) **A comparative study of methods to estimate factor scores for reports of parental behaviors.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 149-150. Factor analyses of the Child's Report of Parental Behavior Inventory have repeatedly yielded 3

factors. It is suggested that these factors rather than the original scales be employed in future studies. 3 methods of estimating factor scores were compared in terms of their validities. The methods compared were multiple regression, weighted sums, and unweighted sums. These methods were applied in turn to all the scales which best define a particular factor, the 3 best scales and finally, the 2 best scales. It is concluded that using unweighted scale sums of 2 or 3 scales provide highly valid estimates of factor scores.—*Author abstract.*

2759. Carpenter, James C. (Ohio State U.) **Patterns of self-disclosure and confirmation in mother-daughter communication.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4331.

2760. Nelsen, Edward A. & Vangen, Patricia M. (North Carolina Central U.) **The impact of father absence upon heterosexual behaviors and social development of preadolescent girls in a ghetto environment.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 165-166.—Compared 42 father absent (FA) and 53 father present (FP) 8th grade girls from a ghetto environment to investigate the impact of father absence upon heterosexual behaviors and concepts. A questionnaire concerning dating practices, peer relationships, and other issues and a slang word association task were administered. Among the girls who had dated, the FA girls reported they began dating at an earlier age and that they dated more frequently than the FP girls. The FA girls emitted more slang responses to the topic sex than the FP girls, while the FP girls emitted more slang responses to family members than did the FA girls. Results are interpreted as suggesting that FA girls were exposed to sexually provocative experiences at an early age, whereas the fathers of the FP girls appeared to have a role in controlling and restricting the dating and sexual expressiveness of their daughters.—*Author abstract.*

2761. Nuttall, Ena V. & Nuttall, Ronald L. (Public Schools, Lexington, Mass.) **The effect of size of family on parent-child relationships.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 267-268.—Using Schaefer's Children's Report of Parental Behavior Inventory on public and private schoolchildren in Puerto Rico, it was found that 3 factors appeared, replicating those found by Schaefer. As family size increases both mother's and father's Acceptance of both boys and girls declines. For girls, but not for boys, both parents' Hostile Psychological Control increased with increasing family size. The only-child girl, however, is much less Accepted by her mother and especially less Accepted by her father than is the 2- or 3-child family girl. In general, family size seems to affect girls much more than it does boys.—*Author abstract.*

2762. Olsen, Nancy J. (Stanford U., Social Research Lab.) **Sex differences in child training antecedents of achievement motivation among Chinese children.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 303-304.—Administered a verbal measure of achievement motivation to 36 6-10 yr. old children in a Taiwanese village. Their mothers responded to the Six Cultures Mother Interview, from which 4 items concerning independence training were selected. 2 of the items—low reward for dependent overtures, and early training in self-reliance (feeding and dressing)—were found to be significantly related to achievement motivation in boys, as was a summary score based on all 4

items. Independence training was unrelated to achievement motivation in girls.—*Author abstract.*

2763. Osofsky, Joy D. & Oldfield, Susan. (Cornell U.) **Children's effects upon parental behavior: Mothers and fathers' responses to dependent and independent child behaviors.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 143-144.—Studied 42 middle-class mothers' and fathers' responses to their daughters' dependent and independent behaviors utilizing observational and interview methods. As predicted, different children's behaviors differentially affected parental responses. Both parents displayed more controlling behaviors, and physically and verbally interacted more, when the children acted dependent. In addition, on the basis of parental sex, differences in observed and reported parental responses were noted related to children's behavior, birth order, nursery school experience, and reported encouragement of independence. Theoretical and research implications are discussed.—*Author abstract.*

2765. van der Veen, Ferdinand & Haberland, Herbert W. (Inst. for Juvenile Research, Chicago, Ill.) **Family satisfaction and congruence of family concepts among adolescents and their parents.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 147-148.—Relationships between the family concepts in 24 3-person normal family groups were investigated, employing real and ideal Q-sort descriptions of the family as a whole. It was hypothesized that the adolescent's satisfaction and adjustment, derived from his family concept, are greater when there is greater congruence of concepts among the family members. The hypothesis was strongly supported for the congruence of concepts regarding the real family and partly supported for the congruence of ideal family concepts. In addition, the family satisfaction of each parent showed strong positive relationships to the congruence of real family concepts and, in the case of the father's satisfaction, to ideal congruence as well. The family satisfaction of the adolescent was positively related to the father's but not the mother's satisfaction.—*Author abstract.*

2766. Winter, Sara K. (Wesleyan U.) **Mother and child: Fantasies at breast feeding time.** *Psychology Today*, 1970(Jan), Vol. 3(8), 30-32, 56.—The TAT stories of 29 middle-class mothers given while they were nursing their babies were contrasted to those given by 30 middle-class mothers who had recently weaned their babies. The babies of the control group mothers were playing near-by while they reported their TAT stories. Each mother was then interviewed for a 1/2 hr. in her home. Judges, who were unaware of which story came from which group, indicated that the breast-feeding mothers were not bound to chronological order and referred to more positive, pleasurable feelings. The non-breast-feeding group was, on the other hand, much more goal-oriented. In addition, the stories indicated that nursing mothers showed more orality and feminine masochism.—*E. J. Posavac.*

ADOLESCENCE

2767. Anderson, Bengt E. (Gothenburg U., Sweden)

cents' constructing abilities as reflected in their assembling structures on the basis of an industrial design.] *Psichologiai Tanulmányok*, 1967, No. 10, 295-300.

2781. Reale, Paola. *L'influenza del compito nella valutazione di un intervallo temporale*. [The influence of a written task in the evaluating of a time interval.] *Bollettino di Psicologia Applicata*, 1969(Aug), No. 94-96, 111-122.—Studied the influence of homework of 104 13-15 yr. olds in evaluating a 30-sec time interval. 3 experimental conditions were used: (a) empty duration, (b) duration occupied in the formation of the capital letters, and (c) duration in a task involving numbers. The 3 intervals are overevaluated, especially in the monotonous task and in empty duration. The most under-evaluated is the 1 in which the S is the most absorbed. It is concluded that results obtained in the evaluating of the time of each S is related to intellectual efficiency and not related to the perceptual-motor type activity. (19 ref.)—A. M. Farfaglia.

2782. Rosenzweig, Saul. (Washington U.) *Consideration regarding reaction to frustration especially among adolescents*. *Bollettino di Psicologia Applicata*, 1969(Aug), No. 94-96, 3-12.—Administered the adolescent form of Rosenzweig's Picture Frustration (PF) Study to 224 10th grade students to study sex and age differences. Also, the differences in responses to situations in which adults or peers represented frustrators was studied. The PF Study is a semiprojective device consisting of a series of 24 cartoon-like pictures each depicting 2 figures involved in a commonly occurring socially frustrating situation. S must study the picture and write in the correct response. Responses are scored as to type of aggression: obstacle-dominance, need-persistence, and ego defense. Sex differences appear to exist during adolescence. Males are more aggressive (positively and negatively) than females, possibly because of their greater competitiveness with the older generation. Adults are more threatening than peers to teenage Ss.—A. M. Farfaglia.

2783. Rosenzweig, Saul & Braun, Stephen H. (Washington U.) *Differenze dipendenti dal sesso nelle reazioni degli adolescenti alla frustrazione*. [Differences depending on sex in the reactions of adolescents to frustration.] *Bollettino di Psicologia Applicata*, 1969, No. 91-93, 23-33. Studied 224 students from Grade 10-12 who were given Rosenzweig's Picture Frustration Study using the form for adolescents. The test was administered during 1 school day. Ss were divided into 8 groups according to sex and age. Differences depending on sex were found, especially when the frustrating person was represented by an adult as opposed to a contemporary, e.g., male Ss were shown to be more aggressive (either positively or negatively) than female Ss, especially regarding competitiveness with the older generation. The adults are less a threat to male Ss than are their own contemporaries. Results confirm the prevalent opinion on the phase of adolescent development: contrary to infancy and adult life, during adolescence, there are differences of reaction depending on sex.—A. M. Farfaglia.

2784. Sexton, Patricia. (New York U.) *How the American boy is feminized*. *Psychology Today*, 1970-(Jan), Vol. 3(8), 23-29, 66-67.—The entire population of 1000 9th graders of an urban community were studied using the Masculinity scale of the CPI. Among other findings, the results showed that the more masculine the boy, the lower his school grades tended to be. It is urged

that school procedures and values be changed so that boys can remain masculine and avoid later, sometimes violent, attempts to regain their lost manhood.—E. J. Posavac.

ADULTHOOD & OLD AGE

2785. Birren, James E. (U. Southern California, Gerontology Center) *The abuse of the urban aged*. *Psychology Today*, 1970(Mar), Vol. 3(10), 36-38 & 76.—While the primary function of the city is social, this function is often ignored in urban renewal projects. Since the aged, because they are poor and not mobile, often live in the areas of the city thought to be the most deteriorated, their lives are often disrupted by new construction. Planners should consult behavioral scientists for help in considering the life space of the aged and then design so that the aged can live with the rest of the community and not be met by many physical barriers in daily life.—E. J. Posavac.

2786. Moenster, Phyllis A. (Washington U.) *The effect of free association upon retention, as a function of age*. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4316-4317.

2787. Palmore, Erdman B. (Duke U., Center for the Study of Aging & Human Development) *Physical, mental, and social factors in predicting longevity*. *Gerontologist*, 1969(Sum), Vol. 9(2, Pt. 1), 103-108.—Presents results from a 13-yr longitudinal study of possible relationships between intellectual, physical, and social factors of longevity. 268 60-94 yr. old volunteers were subjected to physical, psychiatric, psychological, and laboratory tests. Social history interviews were conducted. Results indicate that standard life expectancy tables are the best predictor of longevity. The other major factors were physical functioning, work satisfaction, and performance scores on the WAIS. However, for 60-69 yr. old men, work satisfaction was the best indicator; for 60-69 yr. old women and Negroes, physical functioning was the best indicator. It is concluded that "maintaining health, mental abilities, and satisfying social roles are the most important factors related to longevity."—S. Knapp.

2788. Parkes, Colin M. (Tavistock Inst. of Human Relations, Unit for the Study of Psycho-Social Transitions, London, England) *The first year of bereavement: A longitudinal study of the reaction of London widows to the death of their husbands*. *Psychiatry, Washington, D.C.*, 1970(Nov), Vol. 33(4), 444-467.—Interviewed 22 London widows under the age of 65 at least 5 times in the 1st 13 mo. after the death of their husbands. The immediate reaction was numbness (10 Ss) and difficulty in accepting the fact of death (16 Ss). Panic attacks were commonest during the 1st mo. (12 Ss) but also occurred during the 3rd-6th mo. (5 Ss). Those who were most disturbed at first recovered more quickly while those who showed no emotion at first were moderately to severely disturbed by the 3rd mo. After the numbness wore off, thought of the deceased and intense pining began. Although restlessness was most marked at the beginning of bereavement (18 Ss), it was still present in a number of widows after 1 yr. (9 Ss). Apathy and disorganization characterized about 1/3 of these widows at the end of this study. (31 ref.)—E. M. Uprichard.

2789. Tiberi, Emilio. *Problemi d'adattamento dell'anziano nella società industriale*. [Adjustment problems of the aged in the industrialized society.] *Bollettino*

di Psicologia Applicata, 1969, No. 91-93, 129-143.

—Studied the problems of old people in relation to the new industrialized Italian society. The most important characteristics of the society are (a) change in the manual labor structure, (b) separation of the family from the place of work, (c) the rational division of work, (d) accumulation of capital, (e) rigorous and rational economic calculating, (f) work concentration in certain areas, (g) urbanization (26% of the Italian population lives in the city), (h) exodus from villages, (i) vertical and horizontal mobility of the society, (j) demographic increase, (k) economic growth, and (l) profound change in social and psychological nature. The personality of today's old is studied. It is a widowed personality looking for the rural environment in which it was formed. Many of the elderly were unable to go to school, hence, most of today's illiterates belong to that age group. "Industrialized society guides us toward a neutral perception of others while in rural or pretechnical society, others were either friends or enemies." (26 ref.)—*A. M. Farfaglia*.

SOCIAL PSYCHOLOGY

2791. Craik, Kenneth H. (U. California, Inst. of Personality Assessment & Research, Berkeley) **The environmental dispositions of environmental decision-makers.** *Annals of the American Academy of Political & Social Science*, 1970(May), Vol. 389, 87-94.—A new interdisciplinary field of research has recently emerged which studies how persons comprehend the everyday physical environment, how they use it, how they shape it, and how they are shaped by it. In seeking an objective understanding of the behavioral aspects of the total personal-social-environmental system, professional environmental decision-makers, such as architects, urban planners, and natural-resources managers, are strategic choices for psychological study. Within this context of environmental design and management, research is being directed toward clarifying the implicit assumptions about environmental behavior held by decision-makers, overcoming social and administrative distances from clients, and conducting systematic follow-up evaluations of the behavioral consequences of planning and design decisions. However, subtle and precise study of man-environment relations will require the development of psychological techniques providing a comprehensive and differentiated description of any person's orientation to the everyday physical environment. Methods for measuring individual differences in environmental dispositions are reviewed, and their potential usefulness for advancing knowledge of the interplay between human behavior and the physical environment is illustrated.—*Journal abstract*.

2792. Deasy, C. M. **When architects consult people.** *Psychology Today*, 1970(Mar), Vol. 3(10), 54-57, 78-79.—There are no recognized experts on the needs of humans relative to their buildings. Zoo animals may have quarters more suited to their needs than people have even though the plumbing and the furnishings are expensive. Careful observation of the way people use existing facilities reveals many surprises. Without taking

the views of the users into account, the architect is guilty of making decisions on the basis of his own values.—*J. Posavac*.

2793. Jacoby, Jacob & Aronoff, Daniel. (Purdue U.) **Political polling and the lost-letter technique.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 209-212.

Attempted to employ the lost-letter technique as an unobtrusive measure to predict patterns of voting behavior. Just prior to the election, 250 stamped envelopes, addressed to volunteer political organizations for the 3 major 1968 Presidential candidates but bearing no return address, were "lost" in various shops and placed under automobile windshield wipers in a Midwestern town. Return rates were 70% for Humphrey, 64% for Nixon, and 62% for Wallace. These were significantly different from the actual returns in which the three candidates received 38%, 57%, and 5% of the vote, respectively. The failure of the technique to predict voting behavior was discussed.—*Author abstract*.

2794. Jaspars, J. M. & Van Berge, Annie. **Social psychology in a dutch mirror.** *Psycholog.*, 1968, Vol. 3(7), 463-475.—Reviews the history of social psychology in the Netherlands. Discussions of research in general: social perception; prejudice and stereotypes; small groups; group cohesiveness, goals, norms, and structure; leadership, and power are included. Training programs and professional activities of social psychologists are discussed. (100 ref.)—*G. Steele*.

2795. Rosselló, Antonio. (Academy of Sciences, Havana, Cuba) **Algunos aspectos psicológicos sobre la guerra en Viet Nam: "Una escuela del crimen."** [Some psychological views on the war in Vietnam: "A crime school."] *Revista Cubana de Medicina*, 1969(Aug), Vol. 8(4), 177-184.—Views fear and discouragement as responsible for various "inhuman and barbarous acts committed by U. S. military personnel," and the indiscriminate use of mass destructive methods, e.g., napalm, toxic gases, and zonal bombing as intended to break the resistance of the North Vietnamese. The Central Intelligence Agency is accused of training soldiers in its "crime school" to become sadists who kill and torture for pleasure, and employ cruel psychological methods in interrogating prisoners. United States soldiers, leaving the scene of battle, are said to suffer from war psychoses, anxiety neuroses, and depression as a reaction to the destruction they themselves create. Silence in the face of such crimes (failure to protest) is equated with the role of accomplice.—*T. V. Webster*.

2796. Vidal-Yebra, José M. (U. Havana, Medical School, Cuba) **Posición del científico y del médico frente a la agresión y el genocidio en Viet Nam.** [Position of the scientist and physician with respect to the aggression and genocide in Vietnam.] *Revista Cubana de Medicina*, 1969(Aug), Vol. 8(4), 169-175.—Protests the military action by the United States in Vietnam, and condemns in the name of the scientists and physicians of revolutionary Cuba those professionals who (a) do not bother to inform themselves of the facts, (b) knowing the facts, fail to speak out against them, and are therefore accomplices, and (c) by their knowledge and effort aid in the creation of weapons capable of producing mass extermination of human beings. A world wide union of scientists and physicians is proposed to work against expansion of the war and campaign for its end. (English & French summaries) (25 ref.)—*T. V. Webster*.

2797. Winkel, Gary H. (City Coll. City U. New York, Graduate Center) **The nervous affair between behav-**

ior scientist and designers. *Psychology Today*, 1970-(Mar), Vol. 3(10), 31-35, 74.—Architects have received little help from social scientists because social scientists have been primarily interested in the effects of the social environment on people but not the physical environment. It is important, however, to develop a theory of the effect of physical arrangements on behavior and the effects of man's technology on nature. Some questions which deserve answers include: the nature of man's response to natural disaster, the best ways to preserve the human relations of a neighborhood, and the best uses of wilderness areas.—E. J. Posavac.

CULTURE & SOCIAL PROCESSES

2798. Abbele, Edoardo. *Il trattamento critico del dato socio-culturale*. [Critical treatment of sociocultural data.] *Bollettino di Psicologia Applicata*, 1969, No. 91-93, 145-148.—Defined sociocultural data as any event that might mean something to those who understand it. For critical treatment of sociocultural data a list must be compiled of all possible meanings which apply to the particular data. Any event presents 3 aspects which merit study: (a) specific factual data, (b) data of the effects on the individual, and (c) data of the motivations on a conscious and unconscious level that animated the protagonist of the event. After being isolated, each of these 3 aspects is subjected to an analysis of the following type: (a) listing of the versions provided by the various sources of information, (b) hypothesis on the presumable factual aspects of the sources of information, and (c) Ss of various social levels to affirm the critical hypothesis to give way to critical analysis.—A. M. Farfaglia.

2799. Andreski, Stanislaw. (U. Reading, England) *Evolution and war*. *Science Journal*, 1971(Jan), Vol. 7(1), 89-92.—Examines the relationship between war and biological and cultural evolution. Argues against an instinctual basis for war. War is regarded as the inevitable result of demographic imbalance and as a necessary condition for the emergence of civilization and the biological ascent of mankind. War ensured survival of the fittest and forced technology and the art of organizing to progress. It is concluded that war has been throughout history the most effective stimulant of cohesion of states and efficiency of government.—A. Santi.

2800. Carballo, Manuel. (Tulane U.) *A socio-psychological study of acculturation/assimilation: Cubans in New Orleans*. *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3053.

2801. Daly, Robert W. (State U. New York, Upstate Medical Center, Syracuse) *The specters of technicism*. *Psychiatry, Washington, D.C.*, 1970(Nov), Vol. 33(4), 417-432.—Reviews contemporary orientations—traditional, modern, and spectral—toward technology. The traditional view sees technology limited by "higher human values"; the modern or technicist view sees technology as inevitable and useful in bringing about the optimum life for all men; and the spectral view is an unconscious view that technology is a mysterious force that controls men. 6 cases are presented in some of which medical data are used as a talisman, and in others the system (or establishment) is an object of paranoia. (28 ref.)—E. M. Uprichard.

2802. Davies, Evan. *This is the way Crete went: Not with a bang but a simper*. *Psychology Today*, 1969-

(Nov), Vol. 3(6), 42-47.—The disappearance of the Minoan civilization on Crete has been a problem for historians and archeologists. An analysis of the designs on the pottery of this people in terms of need for achievement suggests that the civilization had lost its drive before its disappearance. Designs showing high need for achievement appear most frequently just before the great flowering of Minoan art and then appear less and less often. Perhaps there is a parallel to contemporary Western culture since a musical and artistic renaissance occurred in the early 20th century and presently the children of the affluent scorn entrepreneurial achievement.—E. J. Posavac.

2803. Fiedler, Fred E., Mitchell, Terence, & Triandis, Harry C. (U. Washington) *The culture assimilator: An approach to cross-cultural training*. *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 95-102.—Describes the construction of self-administered programmed culture training manuals, called culture assimilators. These programs provide an apparently effective method for assisting members of 1 culture to interact and adjust successfully with members of another culture. Culture assimilators have been constructed for the Arab countries, Iran, Thailand, Central America, and Greece. The steps involved in the development of these programs, and studies validating the culture assimilator programs under laboratory and field conditions are described. (21 ref.)—*Journal abstract*.

2804. Glenn, Edmund S., Johnson, Robert H., Kimmel, Paul R., & Wedge, Bryant. (U. Delaware) *A cognitive interaction model to analyze culture conflict in international relations*. *Journal of Conflict Resolution*, 1970(Mar), Vol. 14(1), 35-48.—Presents a cognitive interaction model for cultural conflict composed of a 4 field matrix of conceptual frameworks: associative-abstractive and universal-oriented-case-oriented. Several types of international conflict are discussed in terms of this model. 3 mediating structures are distinguished and specialized international institutions are considered to be most valuable in providing mutual understanding. Analyses of conflicts guided by this model may lead to strategies which are at variance with the dictates of common sense (unconscious cultural assumptions) and the game theory model based on conflicts of interest. "In becoming aware of images, via the cognitive interaction model, one can distinguish between conflicts of interest and ... understanding and separate the conceptual frameworks within which these conflicts are viewed. This procedure could help to predict, and, hopefully, to manage a conflict between and within the present political entities of the world."—S. Knapp.

2805. Haydu, George G. (Creedmoor Inst. for Psychobiologic Studies, Queen's Village, N.Y.) *Interrelated transformations of Rousseau's life and of Western culture of his time*. *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 161-168.—Describes culture as a pattern of experiential activities through which members of society form and fulfill wants. The cultural changes that occurred between 1770 and 1840 are applied to Rousseau's life, whose need-complexes at 1st were seen as unfulfillable. However, after a transformation in 1750, his major works were created. The new pattern of culture was gained through interrelated integrative transformations. (29 ref.)—H. Roemmich.

2806. Herz, Sylvia. (Marriage Inst., Cranford, N.J.) *Behavioral patterns in sex and drug use on three*

campuses: Implications for education and society. *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 258-271.—A detailed 6-mo study was made of a random sample population of 150 undergraduate college students of both sexes at 3 Eastern universities. Drugs take priority over sex on today's college campus as a means of getting away from tensions. The present was considered more important than the future. Many alluded to a hopeless world, deplored the Vietnam war, and feared the threat of a nuclear holocaust. There was lack of credulity in the older generation. There is urgent need for further research in these areas. (33 ref.)—*D. Prager.*

2807. **Kiefer, Christie W.** (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) **The psychological interdependence of family, school, and bureaucracy in Japan.** *American Anthropologist*, 1970 (Feb), Vol. 72(1), 66-75.—Views the Japanese "examination hell" phenomenon as a series of crisis rites through which the child passes from family-centered to peer group-centered values in a "particularistic" society. It is held that this model has greater explanatory power than the minimization of competition model proposed by others. It is argued that the examination system does not eliminate or significantly relieve the strain imposed by competition on primary group relations in general; it merely displaces the strain from the classroom to the community. The examination as crisis rite model is described as helping to explain the phenomenon of student radicalism and centrifugal relationships in middle-class communities. (34 ref.)—*Journal abstract.*

2808. **Lowin, Aaron; Hottes, Joseph H., Sandler, Bruce E., & Bornstein, Marc.** (State U. of New York, Albany) **The pace of life and sensitivity to time in urban and rural settings: A preliminary study.** *Journal of Social Psychology*, 1971 (Apr), Vol. 83(2), 247-253.—Investigated Ss with a battery of observational and field experimental techniques in several larger cities and smaller towns. On the whole, the urban pace appeared the faster. Other systematic urban-rural differences may, however, undercut this effect. Behavior and site sampling issues are also discussed.—*Author abstract.*

2809. **McGuigan, F. J.** (Hollins Coll.) **Reducción de la tensión internacional por métodos psicológicos.** [Reduction of international stress through psychological techniques.] *Revista Latinoamericana de Psicología*, 1970, Vol. 2(3), 327-341.—Suggests a behavioristic analysis, based on the laws of reinforcement, punishment, and extinction, for the reduction of international stress. The analysis is illustrated with past international events, e.g., Hitler and World War II. It is pointed out that behavioral analysis is applied to individuals, particularly decision-maker individuals, and not to a "nation" in abstract.—*Journal abstract.*

2810. **Rabkin, Leslie Y.** (Mental Health Clinic, Jerusalem, Israel) **Parties and cultural values: A kibbutz example.** *Psychiatry, Washington, D.C.*, 1970 (Nov), Vol. 33(4), 482-493.—Analyzes the social gathering known as "a party" as it occurs in the collective society of a kibbutz. The kibbutz is, of necessity, group-oriented "holding the overriding value of group experience as a basic tenet, of almost mystic intensity." Self-control and conformity are basic to the maintaining of this cultural structure. Social get-togethers on an informal level are composed of persons of about the same age, with chairs arranged in a circle, and conversation of a group, rather than personal, nature. This is not the fear of rejection of extrusion known to cocktail

party attendants in the United States, but there is joking, sexual humor, and group regulation of behavior limits. The party is thus seen as a social microcosm reflecting cultural values and norms of the society as a whole (18 ref.)—*E. M. Uprichard.*

2811. **Rodriguez, Irma S. & Berry, Paul C.** (U. Puerto Rico) **Discriminant analysis of attitudes to political associations with the United States among Puerto Rican students.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 331-332.—600 Puerto Rican university students were divided into groups seeking immediate or eventual independence from the United States, statehood within the United States, or maintenance of the present "commonwealth" status. From 24 demographic and attitudinal measures, 2 highly significant discriminants were extracted. The 1st concerned acceptance of orthodox American political and social beliefs. The 2nd concerned needs for legitimacy vs. willingness to compromise. Issues of Hispanic culture, and language, concern over race relations, or attitudes toward Communism and Castro, while correlated with the 1st discriminant, made little independent contribution. Surprisingly, demographic measures of age, sex, class, etc., contributed even less.—*Author abstract.*

2812. **Yoshioka, Gary A. & Athanasios, Robert B.** (Johns Hopkins U.) **The effect of site plan and social status variables on distance to friends' homes.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 273-274.—In studies of social interaction and friendship formation, some researchers have emphasized the importance of propinquity and position while others have suggested that homogeneity in the social characteristics of individuals plays a major role. This paper explores the effects of several types of variables on the physical distance between the dwelling units of people chosen as friends. Ss were wives in a random sample of 300 dwelling units. Results indicate that variables reflecting site plan, social class, and values or beliefs were significantly related to the average distance between friends' homes. Thus, the data lend support to arguments for both propinquity and status homogeneity as factors which affect the formation and maintenance of friendship patterns.—*Author abstract.*

Ethnology

2813. **Hall, William S.** (Educational Testing Service, Princeton, N.J.) **Two variables associated with differential productive cultural involvement among lower class Negro and Caucasian young men.** *Journal of Social Psychology*, 1971 (Apr), Vol. 83(2), 219-228. Investigated the relationship between productive cultural involvement, racial group membership, and personality among lower-class young men in the United States. Level of culturally productive behavior and environmental press were employed as independent variables. The dependent variables were 2 aspects of personality—achievement orientation and locus of control. The sample consisted of 30 Negro and 30 Caucasian young men, all of whom had dropped out of school at some point in their lives. While found, racial differences seem secondary to those reflecting different degrees of productive involvement.—*Author abstract.*

2814. **Hamm, Norman H., Johnson, William L., & Mullaney, Patricia S.** (U. Nebraska, Omaha) **Racial**

meaning with a mediated generalization procedure. *Psychonomic Science*, 1970(Dec), Vol. 21(6), 359-360. —Tested 78 white and Negro undergraduates, divided equally into white, Negro, and control mediation groups, for generalized responses along a color dimension ranging from medium brown to light tan. Control (no racial meaning implied) and mediational (racial meaning implied) gradients were derived with 5 colors, 2 lighter and 2 darker than the CS. On the control gradient, (a) Ss generalized more to light than to dark colors, and (b) black Ss generalized more to dark and less to light colors than white Ss. No significant mediation or race \times mediation effect was found.—*Journal abstract*.

Social Structure & Social Role

2815. Clavan, Sylvia. (Temple U.) **Women's liberation and the family.** *Family Coordinator*, 1970(Oct), Vol. 19(4), 317-323.—Women's liberation questions and challenges traditionally held ideas about the ideal American woman. Not all liberationists favor destruction of the conjugal family system, but most view the expected role structure of the husband as provider and the wife as homemaker and child's nurse as the basis of their oppression. It is possible that the movement heralds a revolutionary change in the American family. Industrialization, advanced technology, and higher levels of education may spell the end of traditional division of labor by sex.—*M. W. Linn*.

2816. Kalish, Richard A. (U. California, School of Public Health, Los Angeles) **Social values and the elderly.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 51-54.—The aged who have espoused our middle-aged and middle-class oriented values, have participated in their own rejection by so doing. The respect due them as human beings will not be forthcoming until new meaning is given to productivity, achievement, independence, meaningfulness, and futurity.—*A. M. Cawley*.

2817. Misra, S. L. (Army Hosp., Delhi, India) **A comparative study of religio-caste differences in concept formation ability of young adults.** *Psychology Annual*, 1970(Mar), Vol. 4, 10-12.—Hypothesized that Hindu and Muslim students would differ in their concept formation ability and that differences would be found between Hindu castes and Muslim sects. 288 14-19 yr. old students were selected: 24 Ss represented each of the 6 Hindu castes and 72 Ss represented each of the 2 Muslim sects. Lovell's Concept Formation Test and the Trist-Hargreave's Test were administered. On both tests, Muslim Ss scored higher than Hindu Ss. No significant differences were found within the groups, although all Hindu castes differed from the Schedule caste on both tests with the Schedule caste Ss scoring lower.—*S. Knapp*.

2818. Mullick, Rosemary J. & Feierabend, Rosalind L. (Wayne State U.) **Minority-group conflict and conciliation: A cross-national study.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 313-314.—Investigated interactions among 3 participating groups within society: the government, the dominant ethnic/racial majority, and the ethnic/racial minority. 25 countries were chosen from various regions of the world, with different types of government and different levels of development. All have sizable ethnic/racial groups within the population. Data were collected from the *New York Times* for

1955-1959 on all events of conflict and conciliation involving these groups. Hypotheses explored reciprocity of behavior and stability of equilibrium. Results indicate more conflict than conciliation in these group interactions and also support the hypothesis of reciprocity of conflict, although not necessarily of conciliation.—*Author abstract*.

2819. Sharma, K. L. (U. Rajasthan, India) **Attitudes of Indian students towards marriage roles.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 299-300.—Studied Indian male (N = 160) and female (N = 150) students to explore their attitudes toward marriage roles with the help of Jacobson Marriage Role Attitude Scale. Indian males and females significantly ($p < .01$) differed on overall scale. Findings are also compared cross-culturally (Japanese, American, and Thai students). Findings are in unison with the findings of other ethnic groups that males continue to appear more male dominant while females seem more equalitarian.—*Author abstract*.

2820. Stebbins, Robert A. (Memorial U., Newfoundland, St. John's, Canada) **Role distance, role distance behaviour and jazz musicians.** *British Journal of Sociology*, 1969(Dec), Vol. 20(4), 406-415.—In response to the observation that the current state of theoretical and descriptive development of the concept of role distance has led to a paucity of research and to an abundance of confusion, the following aims were pursued: to try to resolve some of the vagueness and ambiguity inherent in Goffman's initial definition and explanation and to suggest a few ways in which research can be carried out on this phenomenon. A concise definition of role distance was presented and differentiated from role-distance behavior (false and true). Research in this area is hampered by the time-consuming necessity of gaining an intimate knowledge of the culture or subculture where role distance is to be studied, and by the fact that the occurrence of role distance is probably relatively infrequent. It was suggested that the best strategy to meet these obstacles was to incorporate this research interest as part of a larger participant O study. By way of illustration some observations on role distance among jazz musicians are presented within the framework of 6 modes of role-distance behavior. They were found to hold both major and minor role-distance attitudes and to take true and false role distance on various occasions.—*Journal summary*.

2821. Turner, Castellano B. & Turner, Barbara F. (U. Massachusetts) **Perception of the occupational opportunity structure, socialization to achievement and career orientation as related to sex and race.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 243-244.—Investigated the relationship of race and sex to college students' perceptions of occupational discrimination against Negroes and women. Negroes perceived more discrimination against Negroes. Negro females perceived more discrimination against women than did males, but while females perceived less discrimination against women than did males. The additional finding that Negro women reported more orientation toward careers suggests the interpretation that white females are less motivated to perceive discrimination realistically since they anticipate less occupational involvement. Results are further interpreted in terms of the differential socialization for achievement by sex reported by Negroes and whites.—*Author abstract*.

Religion

2822. Auw, Andre. (United States International U., San Diego, Calif.) **The trusting community.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3684-3685.

2823. Bardis, Panos D. **Aspetti sociali dell'onomastica personale tra gli antichi ebrei.** [Social aspects of personal onomatology among the ancient Hebrews.] *Rassegna Italiana di Sociologia*, 1970(Jan), Vol. 11(1), 81-98.—Presents a notable contribution to the knowledge of onomatology. The ancient Hebrews gave enormous importance to names, e.g., a name was used to distinguish people or to indicate essences. At 1st their names were very simple, e.g., Ada; last names were rare. Names were either 1 word, e.g., Sarah (princess), or phrases, e.g., Abimelech (my father is king), or Ismael (the Lord will listen). Some of the sources of the ancient Hebrews names were (a) religion; (b) strange divinities; (c) phenomena of nature, e.g., Barak (lightning); (d) animals, especially for females, e.g., Deborah (ape) or Rachel (sheep); (e) plants, e.g., Susannah (lily); (f) precious objects; (g) national heroes; (h) place of birth; (i) day of birth; and (j) purpose, e.g., Eve (life). The ancient Hebrews wanted their names to represent religious, philosophical, or social purposes; thus, onomatology helps us to understand the nature of many social institutions of the Old Testament.—A. M. Farfaglia.

2824. Coursey, Robert D. (U. Rochester) **Liberal and conservative Roman Catholics.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 133-134.—Developed a scale measuring liberal-conservative religious attitudes among Roman Catholics in 3 studies. Study I with high school students found that seniors were more liberal than freshmen, girls more liberal than boys, and that liberalism correlates positively with scholastic aptitude. Study II provides data establishing the scale's reliability and validity among adult parishioners. Religious conservatism is shown to increase with age and decrease with education. A stable factorial structure is discussed. Study III cross-validates the scale using well-matched Ss from the readers of known liberal and conservative Catholic journals.—Author abstract.

2825. Johnson, Paul E. (Christian Theological Seminary, Indianapolis, Ind.) **The faith of a psychologist.** *Pastoral Psychology*, 1970(Oct), Vol. 21(207), 33-38.—"Psychology is empty and valueless without a creative faith. And faith is a fragile bloom without the knowledge and power of scientific discovery."—O. Strunk.

2826. Rader, Blaine B. (Adrian Coll.) **Koinonia and the therapeutic relationship.** *Pastoral Psychology*, 1970(Oct), Vol. 21(207), 39-44.—The basic model for present church fellowship groups is the "koinonia," the intimate spiritual sharing of believers which in New Testament times was thought to be accomplished through Jesus Christ or the Holy Spirit. Between this experience of fellowship and caring and the modern psychotherapeutic relationship there is both congruence and dissonance—congruence being present in the process of the horizontal human relationships, dissonance in the apparent absence of the vertical aspects of true "koinonia."—O. Strunk.

2827. Wicker, Alan W. & Mehler, Anne. (U. Illinois) **Assimilation of new members in a large and a small church.** *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 151-156.—Consistent with behavior setting theory,

26 new members of a small church (338 members) reported greater assimilation than 40 new members of a comparable large church (1599 members). The assimilation measure was a composite based on participation in church activities, felt obligation to participate, sense of belonging to the church, and acquaintance with church members and officers. 42 undergraduates asked to role-play new members of either the small or large church, did not differ in reported assimilation. The 2×2 analyses of variance (large vs. small church, new vs. established members) of self-report data on participation and church records of attendance and contributions revealed greater support for church activities by members of the small church and by established members.—Journal abstract.

Cross Cultural Comparison

2828. Bhalla, Salma & Turner, Castellano. (Holyoke Mental Health Center, Mass.) **A cross-cultural comparison of interpersonal schemas.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 355-356.—Investigated differences in interpersonal schemas (cognitive interpersonal plan) among individuals coming from 2 very different cultures (those of India and the United States). The focus was on 2 particular interpersonal schemas, the superior-subordinate relationship and the heterosexual relationship. After pointing out the major differences between the 2 cultures with regard to these relationships, it was hypothesized that Indians would show more distant interpersonal schemas than Americans on superior-subordinate and heterosexual placements. These hypotheses were supported, and the results were interpreted in terms of cultural variations leading to schemas.—Author abstract.

2829. Brewer, Marilyn B., Campbell, Donald T., & LeVine, Robert A. (Loyola U., Chicago, Ill.) **A cross-cultural test of the relationship between affect and evaluation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 213-214.—The prediction, derived from cognitive consistency theory, that direction of evaluation in interpersonal or intergroup perceptions will be consistent with the affective relationship between the perceiver and perceived was tested in a cross-cultural study in East Africa. Indices of intergroup affect and evaluation were derived from interview responses obtained from members of 30 tribal groups in Kenya, Uganda, and Tanzania. The obtained average correlation between the indices was .33, suggesting that subjective perceptions of outgroup characteristics are not entirely dominated by the prevailing state of intergroup relations. Reports of ingroup characteristics, however, were consistently positively biased.—Author abstract.

2830. Irving, Douglas D. (Rice U.) **The field-dependence hypothesis in cross-cultural perspective.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3691.

2831. Jamison, Kay. (U. California, Los Angeles) **British and American personality stereotyping.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 349-350.—Investigated the stereotypes which Americans have of the British and of themselves, compared these results with D. Katz and K. Braly's 1933 results (see PA, Vol. 8:3181), and then compared the results of the

stereotype investigation with data obtained from a prior cross-cultural study (Jamison and Comrey) done of British and American scores on a test measuring several personality factors. There were several differences between the 1933 and 1969 stereotypes, and a high degree of correlation was found between stereotypes cast and actual personality differences between a sample of British and American Ss on the objective personality inventory.—*Author abstract.*

2832. Long, Barbara H. & Henderson, Edmund H. (Goucher Coll.) **Measuring esteem across cultures.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 255-256.—Examined a nonverbal measure of esteem (Self-Social Symbols Tasks) for reliability and construct validity among samples of 100 early adolescents from Barbados, England, English Canada, France, French Canada, India, Israel, and Thailand. Results showed that Ss in all groups responded consistently (reliabilities .76-.91). Findings supporting validity included the assignment of a negative person to a low position, positive relations between esteem and social status, and between esteem and identification with mother. Findings were similar to those found earlier with American Ss. The measure thus seems useful for cross-cultural studies.—*Author abstract.*

2833. Lynn, R. (Economic & Social Research Inst., Dublin, Ireland) **National differences in anxiety.** Dublin, Ireland: Economic & Social Research Inst., 1971. \$.75.—Advances the theory that there are measurable differences in the level of anxiety among the populations of the advanced Western nations. The method proposed for the measurement of a nation's anxiety level is to: (a) take a number of epidemiological and demographic indices, including the rates of mental illness, suicide, vehicle accidents, coronary heart disease, tobacco consumption, alcoholism, and calorie intake; (b) intercorrelate and factor analyze them to reveal the existence of an underlying general factor; (c) interpret the general factor as anxiety; and (d) score the nations on anxiety on the basis of their factor scores. The nations with the highest anxiety levels were found to be Japan, Germany, Austria, and Italy; those with the lowest anxiety levels were the United States, New Zealand, England, and Ireland.—*Author abstract.*

2834. Meade, Robert D. (Western Washington State Coll.) **Future time perspectives of college students in America and in India.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 175-182.—50 male Hindu students attending college in North India and 50 male American students attending college in the United States were given 15 min. each to write 4 short stories. The 1st line in present tense was supplied by the E, 1 sentence with an economic theme, another with a political theme, another with an occupational theme, and a final 1 with an educational theme. Americans wrote more stories about future in all categories while Indians wrote more stories with a past theme. Results are related to another measure of achievement motivation and to the belief that Americans have set more goals with reference to future attainment than have Indians. (19 ref.)—*Author abstract.*

2835. Melikian, L., Ginsberg, A., Cüceloğlu, D., & Lynn, R. (Economic & Social Research Inst., Dublin, Ireland) **Achievement motivation in Afghanistan, Brazil, Saudi Arabia, and Turkey.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 183-184.—Reported scores on a questionnaire measure of achievement

motivation for male students in Afghanistan, Brazil, Saudi Arabia, Turkey, and Britain. The mean scores declined in the order of the countries given.—*Author abstract.*

2836. Ogletree, E. (Chicago State Coll.) **A cross-cultural examination of the creative thinking ability of public and private school pupils in England, Scotland, and Germany.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 301-302.—Administered the Torrance Test of Creative Thinking to 1165 elementary public and private schoolchildren in England, Scotland, and Germany to determine the influences of culture, school system, social class, grade level, age, and sex on creative thinking. Findings show that the less intellectually-oriented school system produced more creative children. Social class had a definite effect on creativity, favoring the upper- and middle-class groups. Girls were more creative than boys and English children scored higher than children of the other 2 countries.—*Author abstract.*

2837. Smith, Frank J. & Crano, William D. (Michigan State U.) **Concerning the possibility of cross-cultural research: A reexamination of Galton's problem.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 217-218.—"Galton's problem" has become a classic issue in cross-cultural methodology. The present research demonstrates a solution to this problem. Analysis was based on a data matrix of 68 trait variables \times 238 African cultures scaled from the Ethnographic Atlas. Each society was paired with its nearest neighbor and correlations for corresponding variables over all pairs were calculated. The data matrix was then factor analyzed from which 17 marker variables were determined and tabulated with nearest neighbor statistics (r and $1-r^2$). Discussion focused on the pattern of interaction effects of the substantive nature of the marker variables and their nearest neighbor correlations.—*Author abstract.*

Family

2838. Cozby, Paul C. & Rosenblatt, Paul C. (U. Minnesota) **Privacy, love, and in-law avoidance.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 277-278.—In a cross-cultural investigation (59 nonneolocal societies), it was found that romantic love as a basis for marriage and the presence of formal rules of interaction with the mother-in-law are positively related to privacy for newlyweds. The findings support the view that privacy serves to allow the individual to interact with certain people without the intrusions of others, as well as allowing him to escape from the tensions of interacting with others. The relationship of the results to a general theoretical conception that man organizes his physical environment to maximize his range of behavior options is discussed.—*Author abstract.*

2839. Cross, Herbert J. & Aron, Robert D. (U. Connecticut) **The relationship of unobtrusive measures of marital conflict to remembered differences between parents.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 365-366.—1 source of marital conflict is differing expectations between spouses about the respective roles of husband and wife. These differences are partly determined by parental child rearing and by differences

between parents. A difference between one's mother and one's mother-in-law, for example, might contribute to a differing expectation of the wife's role between spouses. Unobtrusive measures of conflict were taken from conjoint interviews with young married couples who rated parental behaviors on a questionnaire. Husbands' competitiveness in the interviews related to differences in psychological control between the husbands' parents. Conflict between spouses was related to differences between their mothers.—*Author abstract.*

2840. Kennell, John H., Slyter, Howard, & Klaus, Marshall H. (Babies & Childrens Hosp., Cleveland, O.) **The mourning response of parents to the death of a newborn infant.** *New England Journal of Medicine*, 1970(Aug), Vol. 283(7), 344-349.—Observed the reactions of mothers to the loss of a newborn infant and explored the strength of the affectional ties between mothers and their infants before the 1st physical contact. 20 women were interviewed after the death of the infant; every mother mourned even when her baby was nonviable and lived for only an hr. There were no unduly upsetting effects of early tactile contact in emotionally healthy mothers. A high degree of mourning was most often found in mothers who were pleased to be pregnant and who had previously lost a baby. There was also, possibly, a higher degree of mourning in mothers who had touched their baby before its death, and who had not talked with their husbands about the loss. Strong affectional bonding appears to begin before physical contact and caretaking but is enhanced by these activities.—*Journal abstract.*

2841. Sweet, Phyllis R. & Nuttall, Ronald L. (Boston Coll., Inst. for Human Sciences) **Predicting family size from parental characteristics.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 269-270.—Based on components of parental background, an attempt was made to predict family size. About 3600 Puerto Rican secondary school students reported on their family background and size. 4 groups of background variables were dealt with: those relating to socioeconomic status, religion, mobility, and community integration. Using multiple regression techniques, small families had more educated, higher occupational prestige parents with the mother working at a higher occupational status. Small families tended to be new to the community and the island. Omitting the atypical 1-child family allows a stronger set of predictions with fewer variables.—*Author abstract.*

Social Change & Social Programs

2842. Bell, Leland V. (Central State U.) **Death in the technocracy.** *Journal of Human Relations*, 1970, Vol. 18(2), 833-839.—Discusses the changes in man's concept of death and immortality from ancient times to contemporary America, which is considered here as the quintessence of the technologically advanced nation. It is suggested that the menace of nuclear or chemical-biological warfare gives death a new meaning by nullifying all conceptions of immortality. Technology, by extending man's life span beyond the average individual's usefulness in a youth-oriented culture, has segregated the aged and relegated their deaths to depersonalized and dehumanized statistics. The exploitation of the aged's unfulfilled dreams and the guilt feelings of relatives by the medical and undertaking professions using technological gimmicks is discussed. It is suggested

that contemporary excursions into violence, sex, and the occult have been encouraged by the technocracy's repudiation of death.—*J. G. Tiedemann.*

2843. Hopkins, Phyllis & Feierabend, Rosalind L. (San Diego State Coll.) **Correlates of United States riots, 1965-1967: A cross-city comparison.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 311-312.—Explored correlates of Negro riots, 1965-1967. Hypotheses are that (a) higher attainment but greater relative deprivation and faster change for Negroes, midlevel police coercion, more discriminatory potential of city government, larger population size, density, and percent nonwhite will be positively associated with greater rioting. Findings reveal that better Negro education and income but worse employment conditions in 1950, improvement in Negro income and employment conditions 1950-1960, midlevel ratio of police to residents, mayor-council city government, larger population size and higher density all correlate with riot severity. Results suggest a frustration explanation of Negro rioting based on notions of "rising expectations" and relative deprivation.—*Author abstract.*

2844. Margolis, Clorinda G. (Thomas Jefferson U., Jefferson Community Mental Health Center) **The black student in political strife.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 395-396.—Negro students, today, are subject to a distinctive set of pressures too powerful to be ignored, and too diverse to be easily reconciled. This paper discusses some of the problems confronting young Negroes in the effort to handle the strains of maturation, self-interest, and personal development at the same time they are obliged to reconcile personal values with the inevitably demanding objectives of local political groups that either represent or claim to represent the Black Power movement. The pressures and polarized options that obtain produce severe conflict particularly in students who, for a variety of reasons, are disinclined to adopt a separatist position.—*Author abstract.*

2845. Raine, Walter J., Abudu, Margaret J., Burbeck, Stephen, & Davison, Keith. (California State Coll., Long Beach) **Empirical structure of the urban black subculture as related to riot activity.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 315-316.—Reports an empirical investigation in which the pattern of 742 fires set during the Los Angeles 1965 revolt is found to be significantly associated with a small number of socio-demographic variables. The ability of these 6 census variables and 4 store-type variables to predict fires is represented by a multiple R of .685. The study variables are used to construct an underlying structure of the new urban Negro subculture. The empirical basis of this configuration allows confirmation or disconfirmation by further work.—*Author abstract.*

2846. Skellie, F. Albert; Lipsey, Mark W., & Gordon, Joel F. (Johns Hopkins U.) **Research and relevance: Psychology's potential for social concern.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 405-406.—A sample of graduate students and faculty members in American departments of psychology were surveyed concerning, among other things, opinions about the desired relationship between psychology and the problems of society. A large majority of the respondents felt that psychology should be concerned with contemporary problems, but most agreed that it was not contributing

significantly to their solution. More students than faculty, and more respondents in "experimental" than in "nonexperimental" areas favored an increased involvement with the community. This suggests that the consensus in the discipline is undergoing change toward increased integration of psychological research and social needs.—*Author abstract.*

SEXUAL BEHAVIOR

2847. Broderick, Carlfred B. (Pennsylvania State U., Coll. of Human Development) **Sex and ethics: The rights of parents.** *Pastoral Psychology*, 1970(Nov), Vol. 21(208), 55-59.—"If getting children to internalize a responsible sex ethic is difficult, it is no more so than the responsibility to protect one's youngsters from sexual involvement and possible exploitation." Involvement in sex education on the part of educators and community leaders is necessary if their people and programs are to be served.—*O. Strunk.*

2848. Calderone, Mary S. (Sex Information & Education Council of the United States, New York, N.Y.) **Sex education for the society: The real stumbling block.** *Pastoral Psychology*, 1970(Nov), Vol. 21(208), 48-54.—Discusses various dilemmas facing Christianity in a day of new scientific truths about sex.—*O. Strunk.*

2849. Erickson, Richard C. (Veterans Administration Hosp., Seattle, Wash.) **A defense of the traditional Christian ethic.** *Pastoral Psychology*, 1970(Nov), Vol. 21(208), 43-47.—"The teachings of Scripture makes us creative masters, and sexual anarchy passive slaves of our sexual appetite. It is this good news we want to remind ourselves of and address to our children."—*O. Strunk.*

2850. Kirkendall, Lester A. & Anderson, Peter B. (Oregon State U.) **Authentic selfhood: Basis for tomorrow's sexual morality.** *Pastoral Psychology*, 1970(Nov), Vol. 21(208), 19-32.—"The purpose of morals is to enable man to survive and to survive joyously." The "need is to talk about how individuals, families, schools, churches, and civic institutions can build autonomous, fully-functioning, loving persons; individuals with authentic self-hood, and depend upon this knowledge to take care of the moral issue." (16 ref.)—*O. Strunk.*

2851. Packard, Vance. **Possible elements for a modern sex code.** *Pastoral Psychology*, 1970(Nov), Vol. 21(208), 33-42.—Outlines criteria for a new code of sexual ethics which would include society's disapproval of sexual intercourse between unmarried young people unless 3 elements are present: (a) that a deep friendship based upon substantial acquaintance exists between the man and woman, (b) that both are past adolescence, and (c) that they hope to marry and their best friends know of the hope.—*O. Strunk.*

2852. Rublin, Isadore. **What areas of agreement on sexual ethics are there for the religionist and the humanist?** *Pastoral Psychology*, 1970(Nov), Vol. 21(208), 10-17.—"If a genuine dialogue is to take place between the religionist and the humanist, it can be done only on the basis of a high regard for truth, a respect for logic, and an insistence upon finding answers in experience, critically examined and objectively interpreted." (31 ref.)—*O. Strunk.*

2853. Winthrop, Henry. (Central State U.) **Focus on the human condition: Sexual revolution or inner**

emptiness: Portents of Brave New World: II. The skin trade versus holistic balance in sexuality. *Journal of Human Relations*, 1970, Vol. 18(2), 924-938.—Suggests the encouragement given to the sexual revolution by some of the current better known middlebrow and avant-garde publications ranges from simply noting changes in sexual attitudes, morality, and behavior to catering to, reinforcing, extending, or intensifying amorphous sexual innovations. Examples of how the cinema, stage, and other media are cashing in on the "skin trade" are presented. The rising misuse of obscenity as an attempt to prove one is intellectually and socially liberated from "bourgeois hangups" is contrasted to authentic social, intellectual, and spiritual liberation. The quest for sexual freedom is regarded more as an accelerating movement towards the *Brave New World* presaged by Huxley, than a liberation from Puritan shackles. The new sexual freedom does not release the individual from social constraint, but simply binds him to new and fashionable sexual behavior. Achieving genuine sexual freedom and personal authenticity demands intellectual and moral depth, and will complement personal growth, self-respect, and development of the communal sense, as well as guaranteeing satisfaction of physiological needs. (17 ref.)—*J. G. Tiedemann.*

Birth Control & Abortion

2854. Baird, Anne C. (Emory U.) **Some social psychological correlates of fertility control.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3066.

2855. Fischer, Edward H. (Connecticut Valley Hosp., Middletown) **Attitudes toward limiting family size: Convergence of factorial and known-groups validity approaches.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 263-264.—Ss were 135 nursing, 74 university extension, and 103 liberal arts students. Likert-style ratings of birth planning statements were factor analyzed. 3 factors emerged: concern about overpopulation/intention to have small family, objective view of procreation, and birth control attitude. Concern and intention items, ostensibly separate in structure and content, both loaded on Factor I. Also, both types of items differentiated selected Ss wanting small or large families, at $p < .0001$. However, only intention (not concern) correlated strongly with preferred family size. Upper-class people, non-Catholics, and men showed greater concern about population growth and held attitudes more favorable to birth limiting than their demographic counterparts (i.e., lower-class people, Catholics, and women, respectively).—*Author abstract.*

2856. Kar, S. B. (Central Health Education Bureau, New Delhi, India) **Individual aspirations as related to early and late acceptance of contraception.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 235-245.—Tested 5 hypotheses about positive relationship between contraception and (a) level of striving, (b) future orientation, (c) value orientations, (d) social optimism, and (e) areas of satisfaction in life, while socioeconomic status (SES) is held constant. The sample consisted of 209 married women from lower social status and the hypotheses were tested by comparing the early and the late acceptors of contraception among white Ss. The 1st 4 hypotheses are validated and these relationships are

independent beyond SES. The multiple correlation coefficient between the independent variables and contraception is .78. The leading predictors of contraception are: level of striving, future orientation, SES, and value orientations. (24 ref.)—*Author abstract.*

2857. Resnik, H. L. & Wittlin, Byron J. (National Inst. of Mental Health, Center for Studies of Suicide Prevention, Chevy Chase, Md.) **Abortion and suicidal behaviors: Observations on the concept of "endangering the mental health of the mother."** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 10-20.—Psychiatrists have borne increased responsibility for translating liberalized abortion laws into recommendations for interruption. Suicidal risk is most commonly cited although research indicates that death by suicide virtually never occurs in pregnant but rather postpartum women—an infrequent event that is rarely possible to predict. In relation to "endangering mental health" other factors—unwanted pregnancy, "psychiatric disease," emotional sequelae of abortion—are discussed and recommendations offered to nonpsychiatrist physicians.—A. M. Cawley.

ATTITUDES & OPINIONS

2858. Archibald, W. Peter. (U. Michigan) **Self-esteem and balance with impersonal attitude objects.** *Psychonomic Science*, 1970(Dec), Vol. 21(6), 363-364.—Previous research demonstrates that cognitive-consistency predictions should take Ss' self-esteem into account, for what is consistent for those with positive self-esteem may be inconsistent for those with negative self-esteem. In most studies the attitude object is the S himself, so that liking for others with whom one agrees is balancing for all Ss. For Ss with negative self-esteem, however, liking for others with whom one disagrees should be balancing when the object of disagreement is an impersonal one. In the present experiment 38 undergraduates differing in self-esteem were presented with 3 levels of agreement-disagreement over the war in Vietnam, with 3 different hypothetical others. Contrary to the hypothesis, a Self-Esteem X Agreement interaction was not obtained, the only strong and consistent effect being a main effect for agreement. Results are discussed in terms of the limited range of the self-esteem variable and the questionable validity of the hypothesis.—*Journal abstract.*

2859. Bruvold, William H. (U. California, Berkeley) **Rater's attitudes and the method of equal-appearing intervals.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 373-374.—Raters having pro- or antiattitudes and high issue involvement rated 2 sets of statements regarding high contact use of water reclaimed from community sewage. A largely linear relationship between item scale values was obtained from the 2 groups with displacement of agreed-with items in a positive direction and disagreed-with items in a negative direction. These results are consonant with the requirements of a linear displacement theory of judgment and interval level measurement.—*Author abstract.*

2860. Cauthen, Nelson R., Robinson, Ira E., & Krauss, Herbert H. (Holyoke Mental Health Center, Mass.) **Stereotypes as contexts of meaning.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 353-354.—Assuming that the context of stereotypes has some effect on the

connotations attached to them, 12 words selected from those which make up the Negro stereotype were presented in 3 contexts and rated on the semantic differential Ss were freshmen and sophomore college students. For the 3 administrations of the semantic differential, context was created by identifying the words as descriptive of Negroes, Americans, and without a specific context. In general, the words in the Negro context were rated as more potent. Certain words were also rated as less active in the Negro context. The words were not rated differently for evaluation in any of the 3 contexts.—*Author abstract.*

2861. Cooper, Michael R., Fein, Victoria E., Washburn, Paul V., & Boltwood, Charles E. (Ohio State U., Organizational Research Service) **Passenger attitudes toward airline security and threat of skyjacking.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 407-408.—Structured interviews and questionnaires were administered to 102 airline passengers at a large Midwestern airport to investigate the nature of public reaction to skyjacking and of attitudes toward several proposed security procedures. Results indicate the following: (a) a general construct, "concern for security," did not adequately account for passenger acceptance of security precautions; (b) 3 dimensions of security procedures failed to differentially relate to public attitudes toward air safety; and (c) particular subgroups of the sample were related to particular attitudinal response patterns, including frequency of flying, distance of flight, age, and sex.—*Author abstract.*

2863. De Vincenzo, Doris K. (New York U.) **Socio-cultural relocation and changes in anxiety and attitudes toward the United States as host country among exchange visitor nurses.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4155.

2864. Ganti, Vernon W. (Ohio U.) **Attitude change as a function of source credibility and levels of involvement.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3074.

2865. Kilty, Keith M. (U. Illinois) **Some determinants of the strength of relationship between attitudinal affect and cognition.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 275-287.—Investigated, in 2 experiments, several factors that seemed to affect a relationship between attitudinal affect and cognition. These factors included the source of beliefs (whether freely elicited from the Ss or standard beliefs supplied by the E, the number of beliefs, the type of belief statement, and the type of attitude object. Results show that the relationship between affect and cognition can become very complex. The type of concept was of major importance, involved in interactions with both source of beliefs and number of beliefs in the 2nd study. (19 ref.)—*Author abstract.*

2866. Lester, D. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Religious behavior and the fear of death.** *Omega*, 1970, Vol. 1(3), 181-188.—Religious denomination had little effect on the fear of death of college Ss. Among Protestant Ss those with low religiosity had a higher fear of their own death whereas those with high religiosity had a higher fear of the death

of others. Ss with low religiosity had less inconsistent death attitudes. No differences were found in unconscious attitudes toward death as assessed by a word-association test. It is concluded that religiosity had a greater effect on death attitudes than denomination.—*Author abstract.*

2867. Littig, Lawrence. (Howard U.) **Affiliation motivation and belief in extraterrestrial UFOs.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 307-308.—77 undergraduates, differing in strength of affiliation motivation, expressed their degree of belief in the extraterrestrial origins of unidentified flying objects (UFOs). Strong affiliation motivation was associated with this belief and weak affiliation motivation was not. It was conjectured that belief in extraterrestrial UFOs constitutes, in part, a projection of affiliation motivation.—*Author abstract.*

2868. Phifer, Mary K. (U. Oklahoma) **Influence of the process of discrimination in the selection of items for an attitude scale.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3042.

2869. Rosencranz, Howard A. & McNevin, Tony E. (U. Connecticut) **A factor analysis of attitudes toward the aged.** *Gerontologist*, 1969(Spr), Vol. 9(1), 55-59.—Examined attitudes and the effects of different social experiences on stereotypes of the aged. The Aging Semantic Differential Test was constructed and tested with 200 17-21 yr. old Ss. The final form was administered to 287 undergraduates. Ss were asked to rate 20-30, 40-55, and 70-85 yr. old males. Personal data from each S were collected for sex, age, father's occupation, and social contact with the aged. Significant differences were found on all 3 scales of the test. On the instrumental-ineffective scale, older men were regarded as less effective; on the autonomous-dependent scale, young and old men were seen as dependent, while middle-aged men were seen as autonomous; and on the personal acceptability-unacceptability, little difference was found between young and middle-aged men, while older men were regarded as least personally acceptable. Ss who had contact with grandparents or other meaningful association with the aged judged them more favorably except on the instrumental-ineffective scale. Hospital contact with the aged seemed to have a consistently negative effect on attitudes. The text of the Aging Semantic Differential is presented. —S. Knapp.

2870. Schmiedler, Gertrude & Windholz, George. (City Coll., City U. New York) **A nonverbal measure of attitudes: I. Data from Thailand.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 215-216.—Over 200 Thai college students were compared with American college students. Attitudes toward abstract concepts were similar, but attitudes toward family relations were different. Birth order effects offered some internal validation for inferences about Thai family patterns. The response measures were line drawings, scored for direction, size, pressure, etc. Other research has demonstrated that some of these correspond to scores on the semantic differential. Since responses are nonverbal and rapid, the method is useful for transnational research. Cross-cultural similarities in expressive movements, if found generally, have interesting implications for personality theory.—*Author abstract.*

2871. Steinmann, Anne & Fox, David J. **Attitudes toward women's family role among black and white undergraduates.** *Family Coordinator*, 1970(Oct), Vol.

19(4), 363.—An Inventory of Female Values was administered to 100 Negro and 126 white female undergraduates and to 100 Negro and 82 white college men. The Negro college womens' perceptions of man's ideal woman were different from the perceptions of any group of women previously studied. Although Negro female undergraduates had self and ideal woman perceptions no different from their white counterparts, their perceptions of man's ideal woman were far less family-oriented and far more self- and action-oriented.—M. W. Linn.

2872. Taylor, Howard F. (Syracuse U.) **Semantic differential factor scores as measures of attitude and perceived attitude.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 229-234.—40 male undergraduates indicated both their attitude toward an issue, and their perception of a role player's attitude (perceived attitude), by means of 12 semantic differential items. Factor analysis reveals nearly identical factor structures for both attitude and perceived attitude ratings. Factor scores for each S were computed for attitude and perceived attitude ratings. When factor scores on the attitude factor were related to an independent criterion measure, they were found to discriminate between Ss holding favorable and unfavorable attitudes. The same results were obtained with perceived attitude factor scores. Thus, semantic differential factor scores are valid weighted indices of the direction of one's attitude and one's perception of the attitude of another.—*Author abstract.*

2873. Truzzi, Marcello. (Cornell U.) **Explorations in cognitive balance theories: Experimental assessments of conflicting theoretical predictions in the cognitive consistency theories of F. Heider, T. M. Newcomb and C. E. Osgood and P. H. Tannenbaum.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3063.

Formation & Change

2874. Alimaras, Peter E. **Impression change as a means of reducing cognitive dissonance.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3684.

2875. Cook, Thomas D. & Wadsworth, Allen. **Attitude change and the paired-associate learning of minimal cognitive elements.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 387-388.—Ss heard a message in which the conclusion was presented once or 7 times. 4 days later, they received a letter which mentioned that 85, 50, or 15% of the persons who had heard the message had evaluated it as convincing. The letter to another group of Ss made no reference to peers' evaluations of the message. Attitude was assessed immediately after hearing the message, and 1 and 6 wk. later. Attitude varied directly with the support manipulation only when the conclusion had been previously heard 7 times. This was the case 2 days and 5 wk. after receiving the letter with the support manipulation.—*Author abstract.*

2876. Cooper, Ralph E. & Crano, William D. (Michigan State U.) **Pretest validity and the prediction of attitude: A further comparison of congruity and summation theories.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 393-394.—Fishbein and his colleagues, in comparing his summation model with Osgood's congruity model of attitude change, typically obtained the premeasure necessary for the Osgood model by asking Ss

to rate a person about whom they had little, if any, information. If such measures produce random variation, then the correlation between the Osgood predictions of postmanipulation attitude and the obtained values would be attenuated, biasing the results in favor of the Fishbein model which does not employ the premeasure. In order to test the plausibility of this hypothesis, 60 Ss were randomly assigned to each of 4 conditions: 1 paralleling the previous studies, 1 in which Ss were presented with information about the object person before the premeasure, and the others serving as controls for the amount of information and for test effects. In all conditions, the superiority of Fishbein's summation model was maintained.—*Author abstract.*

2877. Levy, Sheldon G. (Wayne State U.) **Dimensions of attitudes toward race relations and polarized subgroups in Detroit following the 1967 riot.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 307-308.—Analyses of a random sample of Detroit adults, interviewed after the 1967 riot, indicated 2 major attitudinal dimensions, 1 dealing with race relations, the other with alienation. Analysis of the attitudinal space indicated little overlap in average scores of white and Negro subgroups with the races further apart on the race relations than on the alienation factor. Whites and nonwhites who were high in education and who had close friends of the opposite race were closer in their average scores than any other white and nonwhite pair when race, friendship, and education were used to define the subgroups.—*Author abstract.*

2878. Levy, Sheldon G. (Wayne State U.) **Interaction analysis of attitudinal correlates of leadership evaluation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 309-310.—Analyses of a random sample of Detroit adults, interviewed shortly after the Detroit riot of 1967, resulted in 3 major dimensions for leadership evaluation. Stepwise multiple regressions indicated that attitudes toward race relations, riot interpretations, and trust in government were the most important predictors of leadership evaluation. Interaction effects among subgroups defined by the above 3 attitude variables as well as by experiences with discrimination were then examined. Although greater trust in government led to more positive leadership evaluation, the opposite was true for the evaluation of militant Negro leadership among those who had experienced discrimination.—*Author abstract.*

2881. Shub, Allen N. & Johnson, Homer H. (Science Research Associates, Inc., Chicago, Ill.) **Dimensions of communication evaluation: A factor analytic approach.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 115-116.—An intervening variable, evaluation of the communication, is typically overlooked in attitude change research. In order to determine the dimensions

underlying communication evaluation, a principal components factor analysis with varimax rotation was performed on 14 measures. 3 factors, accounting for 55% of the total variance, emerged: general evaluation, ego involvement, and receptivity toward communication. Results of this study are important for future research involving attempts to discriminate among the various alternative responses to interpersonal disagreement by means of factor-based profile analysis of communications.—*Author abstract.*

2882. Weber, Stephen J. (Northwestern U.) **Source primacy-recency effects and the sleeper effect.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 385-386.—To assess primacy-recency effects for the source of a communication, the order of source presentation (1st or last) was manipulated together with source credibility ($N = 72$ undergraduates). In an attempt to replicate and specify the sleeper effect a condition was added in which the source was repeated 20 times during the course of message presentation. Opinion was then measured 3 times over a 4-wk period. A reliable recency effect of source presentation was found, but there were no indications across any of the low credibility conditions that a sleeper effect occurred.—*Author abstract.*

Influence & Behavior

2883. Himmelfarb, Samuel & Fishbein, Martin. (U. Massachusetts) **Studies in the perception of ethnic group members: II. Attractiveness, response bias, and anti-Semitism.** *Journal of Social Psychology*, 1971-(Apr), Vol. 83(2), 289-298.—22 male and 30 female non-Jewish American college students, varying in degree of anti-Semitism, judged the attractiveness and Jewishness of a series of persons portrayed in photographs. It was hypothesized that for most Ss there would be a positive relationship between the perceived unattractiveness and the judged Jewishness of the stimulus person, and that the correlation between the 2 sets of ratings would vary directly with the Ss' anti-Semitism. It was also hypothesized that anti-Semitism would be positively related to the number of persons judged to be unattractive. Results generally support the hypotheses. These relationships were assumed to mediate the frequently observed relationship between Ss' anti-Semitism and their tendency to label stimulus persons as Jewish.—*Journal summary.*

2884. Kamal, Zahi S. (Washington State U.) **Congruency of own and others' attitudes as an intervening variable between attitude and behavior.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3057.

2885. Kaplan, Kalman J., Flagstone, Ira J., Moore, Michael, & Degnore, Roberta. (Wayne State U.) **Attitude toward an interviewer as a function of question intimacy across three interview settings.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 375-376.—In a test of a gradient approach to attitudes, 148 male undergraduates were asked to differentiate their liking and disliking responses towards an interviewer as a function of the intimacy level of the questions he asked for 1 of 3 interview settings (business, psychotherapeutic, or sex inventory). For all settings, intimate questions generated less favorable net attitude (liking + disliking) but greater total affect (liking + |disliking|) than nonintimate

questions, the unfavorable net attitudinal implications of intimacy being especially pronounced for the business setting Ss. Implications are drawn for the Zajonc "mere exposure" and the Argyle and Dean "distance equilibrium" hypotheses.—*Author abstract.*

2886. Snortum, John R. (Claremont Men's Coll.) **Attitudes toward criminality as held by community residents, police officers and prison inmates.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 401-402.—Ss were asked to recommend prison sentences and to estimate the rate of recidivism for 10 criminal offenses. In the community sample, education and social status were found to be inversely related to sentence length and age was positively correlated. Women were significantly more punitive than men. Implications of these findings for the jury selection process are discussed. Contrary to expectations, prison inmates generally assigned longer sentences than community residents or police. The fact that inmates made significantly lower recidivism estimates than community residents or police may indicate that inmates harbor feelings of special invulnerability to arrest.—*Author abstract.*

2896. Crawford, Jeffrey & Haaland, Gordon A. (U. New Hampshire) **Predecisional process and information seeking in social influence.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 361-362.—Examined the joint effects of task uncertainty, motivational orientation (cooperative or competitive), and the reinforcement value of information received in relation to information seeking and subsequent conforming behavior. Persons with a cooperative set sought significantly more information from their co-workers than did competitively oriented persons ($p < .001$). The seeking of information from others which increased the probability of a correct choice decreased over time while the rate of search for random information remained constant ($p < .01$). The nature of the information received affected conformity across all conditions ($p < .001$). However, cooperative groups conformed more than competitive individuals when event occurrence was equiprobable ($p < .06$). Results are discussed in a decision making, reinforcement framework.—*Author abstract.*

2897. Davis, Dan W. (George Peabody Coll. for Teachers) **The effects of individual, structural, and positional variables on problem-solving groups.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3035.

2898. Doise, Willem & Moscovici, Serge. (Ecole Pratique des Hautes Etudes, Paris, France) **Approche et évitement du déviant dans des groupes de cohésion différente.** [Acceptance and rejection of the deviant within groups of differing cohesiveness.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(9 10), 522-525.—Studied the influence of a deviant upon 2 groups, one with high and the other with low cohesion. Quick exposure of his deviancy (e.g., disagreement) resulted in rejection with later assimilation by the high cohesion group. Greater tolerance for the deviancy was exhibited by the low cohesion group.—R. E. Smith.

2899. Dossett, Dennis L. & Mitchell, Terence R. (U. Washington) **The Culture Assimilator: A review of validation studies.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt.

1), 329-330.—Describes the Culture Assimilator, a programed self-instructional approach to culture training, and a series of laboratory experiments and field studies validating the Culture Assimilator are reviewed. The results indicate that increased personal adjustment and better interpersonal relations between heterocultural groups are obtained for Assimilator training as compared to cultural essay, geography, or no training. Productivity measures are less affected, although there is some evidence that Assimilator training may help increase productivity as well.—*Author abstract.*

2901. Emshoff, James R. & Ackoff, Russell L. **Explanatory models of interactive choice behavior.** *Journal of Conflict Resolution*, 1970(Mar), Vol. 14(1), 77-89.—Describes the research methodology and results of a study of individual choice in conflict situations. The objective was to develop a theory of choice which could explain decisions in terms of variables subject to external control. Graduate and undergraduate students played various forms of the Prisoner's Dilemma and Chicken games. The choice- and policy-matching theories were examined. Role-reversal theory—that an S selects the choice he believes his opponent would select if the opponent were in his place—provided the most accurate predictions. However, none of the theories predicted well when the S's attitude toward the game was favorable and toward his opponent was unfavorable. Subjective estimates of belief and attitude were made and various objective measures attempted. A teaching hypothesis that S would try to change the opponent's choices through various means was investigated and provided a slight improvement in prediction. Application of theories to larger games maintained the superiority of the role-reversal theory for prediction.—*S. Knapp.*

2908. Helm, Bob; Bonoma, Thomas V., & Tedeschi, James T. (State U. New York, Albany) **Counter-aggression as a function of physical aggression: Reciprocity for harm done.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 237-238.—60 males received either 1, 5, or 9 electric shocks of varying magnitude from a confederate during a 10-trial probability estimation task. Following initial trials, S and confederate reversed roles, and Ss were permitted equal opportunity to counter-aggress against the confederate. $\frac{1}{2}$ the Ss had been forewarned of role reversal, while the remainder had not. Results indicate that frequency of reciprocated shock (counteraggression) was a direct and linear function of frequency of initial aggression delivered. Postimpressions of the confederate indicated that frequent aggressors were perceived as less attractive and esteemed than infrequent aggressors, but as more active and potent.—*Author abstract.*

2909. Horowitz, Irwin A. (U. Toledo) **The effect of group norms on bystander intervention.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 265-273.—40 members of a service group holding altruistic group norms and 40 members of social fraternities were randomly assigned to 1 of 2 levels of norm salience, high and low, and to either a communication network with 3 or no bystanders. During the conversation pertaining to problems in an urban university the victim simulated a seizure and called for help. An analysis of variance performed on the $2 \times 2 \times 2$ factorial revealed that service group members were more likely to intervene than social group members and intervention was made more probable when group norms were made salient in the discussion. Social group members corroborated previous findings concerning the inverse relation between number of bystanders and likelihood of intervention. This was not true of service group members however as the increase in number of bystanders increased their felt responsibility for helping and increased the likelihood of intervention. It is suggested that initial differences between the 2 types of group members could just as easily account for differences in likelihood of intervention as can differences in group norms.—*Journal summary.*

2917. Mann, Philip A. (U. Texas) **Effects of anxiety and defensive style on some aspects of friendship.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 55-61.—Proposed that defensive styles can account for individual differences in preferences for emotional comparison in friendship more adequately than levels of anxiety. Deniers, compared to expressers, should give less importance to emotional comparison in their friendships, should be less accurate in perceiving similarity to their friends, and should be objectively less similar to their friends. Analysis of data derived from Omnibus Personality Inventory scores, an anxiety scale measure, and interviews with the reported friends of 57 male and 118 female undergraduates partially support the defensive style hypotheses, more for females than for males. Differences in anxiety produced none of the effects predicted from previous studies. Sex differences in the defensive styles of friends were found. Defensive style differences in the perception of similarity operate only when the relationship between the friends is such that it can be expected to mobilize defensive reactions. (15 ref.)—*Journal abstract*.

2918. Martindale, David A. (Nassau Community Coll.) **Territorial dominance behavior in dyadic verbal interactions.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 305-306.—Examined the matter of territorial dominance in human beings by having 60 male college students negotiate, in dyads, in a nonneutral environment (a dormitory room belonging to 1 of them). Their task was to discuss a fictional criminal case with 1 participant playing the role of defense attorney and the other, the role of prosecuting attorney, and to decide upon an appropriate prison term for the accused. Territorial dominance was assessed by determining whether or not the home participant (the S whose room was being used) would speak more and win the negotiation. "For each dependent variable studied, the territory factor accounted for considerably more variance than the CPI Do factor. . . . These data appear to

demonstrate that environmental context is an important factor influencing both the course and the outcome of a negotiation."—*Author abstract*.

2919. Marwell, Gerald; Schmitt, David R., & Shotola, Robert. (U. Wisconsin) **Cooperation and interpersonal risk.** *Journal of Personality & Social Psychology*, 1971-(Apr), Vol. 18(1), 9-32.—Investigated the extent to which the existence of interpersonal risk may disrupt cooperative behavior in a situation where cooperation is the most effective behavior for the achievement of a desired goal. 8 experiments with a total of 106 pairs of undergraduates indicated that: (a) cooperation was disrupted by the introduction of interpersonal risk, substantially when the risk was small and almost totally when the risk was large; (b) the effect of large risk on cooperation did not change substantially with time; (c) increasing the difference in rewards for cooperating and working individually did not substantially reduce the effect of large risk; (d) large risk did not appreciably disrupt cooperation when taking was not reinforcing to the taker; (e) when the presence of large risk was not related to task choice, the effect of risk on cooperation was reduced but not eliminated; (f) the ability to communicate when large risk was introduced very substantially reduced the effect of risk on cooperation; and (g) if the ability to communicate was permitted following disruption of cooperation by risk, it eventually led to the emergence of cooperation for a majority of groups. However, cooperation emerged more slowly than when communication was available prior to disruption by large risk. (29 ref.)—*Journal abstract*.

2920. Mérei, Ferenc. **A pár és a csoport: Csoportdinamikai kísérletek gyermekeken.** [The pair and the group.] *Pszichológiai Tanulmányok*, 1967, No. 10, 153-160.

2921. Nydegger, Rudy V. (Rice U.) **Leadership status and verbal behavior in small groups as a function of schedule of reinforcement and level of information processing complexity.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 293-294.—In the manipulation of verbal behavior and sociometric rank in small groups by using positive reinforcement, it was contended that the informational aspects of the reinforcements were more important than the motivational ones, and this study lent some credence to this notion. Thus, the effects of information processing complexity and quantity of reinforcement (0, 50, 100%) were examined, and it was found that all Ss in the reinforcement conditions showed a conditioning effect, and that cognitively abstract Ss were more susceptible to influence in this setting than were concrete Ss. No significant difference between partial and continuous reinforcement was found.—*Author abstract*.

2922. Ohlson, Edward L. (U. Oklahoma) **The effects of the female-based family and birth order on the ability to self-disclose.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2742.

2923. Orwant, Carol J. & Orwant, Jack E. (U. Iowa) **A comparison of interpreted and abstract versions of mixed-motive games.** *Journal of Conflict Resolution*, 1970(Mar), Vol. 14(1), 91-97.—Presented a version of the Prisoner's Dilemma game containing 10 "real life" situations and the abstract version of the Prisoner's Dilemma game to 109 male and 56 female journalism students. It was predicted that the interpreted version would yield more cooperation among players and that

no significant sex differences would be found. Results support the prediction. The influence of the different formats and payoffs on the results are discussed.—S. Knapp.

2924. Raack, R. C. (California State Coll., Hayward) **When plans fail: Small group behavior and decision-making in the conspiracy of 1808 in Germany.** *Journal of Conflict Resolution*, 1970(Mar), Vol. 14(1), 3-19.—Presents the history and an analysis of an anti-French conspiracy in Prussia. Utilizing behavioral theory and studies in social psychology it was found that (a) "forces generated within the individual cells tended to heighten the influence of the risk-takers and stifle the voices of the more moderate"; (b) the plot developed a momentum of its own which forced the leaders to act more precipitously than they desired and often at odds with their original plans; and (c) the need for secrecy contributed to group solidarity, member recruitment, and ultimate betrayal to the enemy. Methodological issues raised by the study are discussed. (62 ref.)—S. Knapp.

2925. Rake, Johan M. **Friendship: A fundamental description of its subjective dimension.** *Humanitas*, 1970(Fal), Vol. 6(2), 161-176.—Discusses friendship from the perspectives of philosophy, anthropology, sociology, social psychology, and psychology. From these views basic constituents emerge indicating that friendship "is an encounter between 2 or more persons in a mutual sharing of space and time, embodied in a given culture, involving interaction and communion in light of some interest in one another and in a shared truth or shared search for truth, resulting in an enduring nonexclusive relation which is lived as a gift of affinity, affection, and personal history, and occasioning the autonomous growth of the persons involved."—O. Strunk.

2927. Rioch, Margaret J. (Washington School of Psychiatry, Group Relations Conference Committee, D.C.) **Group relations: Rationale and technique.** *International Journal of Group Psychotherapy*, 1970(Jul), Vol. 20(3), 340-355.—"In order to understand man in society, it is necessary to shift one's view from the individual and the pair to a larger whole. The thrust of the Washington School of Psychiatry-Tavistock Conferences is the attempt to make this shift." After describing the transplantation of educational methods that had developed within the Tavistock Institute of Human Relations of London to American soil, the changes which have taken place are delineated. The conferences, which are set up as residential events, have 4 major aspects: small groups, the large group, the intergroup event, and application groups. "One of the major aims of the conferences is to contribute to people's ability to form serious work groups committed to the performance of clearly defined tasks. Whether or not members of such groups feel friendliness, warmth, closeness, competitiveness, or hostility to each other is of secondary importance. It is assumed that these and other feelings will occur from time to time, but this is not the issue. The issue is the common goal to which each individual makes his own differentiated contribution. A 2nd major aim, closely related to the first, is the

development of more responsible leadership and followership in group life."—I. Linnick.

2928. Sadler, William A. (Bates Coll.) **The experience of friendship.** *Humanitas*, 1970(Fal), Vol. 6(2), 177-209.—Identifies 2 theories of friendship in Western civilization—the Greek and Judeo-Christian, the latter being characterized by joy, communion, freedom, truth, and sacrifice.—O. Strunk.

2932. Senn, David J. (Monmouth Coll., Ill.) **Attraction as a function of similarity-dissimilarity in task performance.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 120-123.—Tested 30 pairs of male undergraduates in an RT task. Attraction toward a stranger was greatest when both Ss performed similarly on the task and both were successful, less when both performed similarly but unsuccessfully, and least when they performed dissimilarly. Findings support I. Byrne's "law of attraction" and extended the generality of the similarity-attraction relationship to task-performance behavior. However, the law appears to be restricted to behaviors which are positively similar. The similarity-attraction relationship was shown to break down when negatively evaluated behaviors were considered. The importance of studying more advanced and permanent relationships is emphasized.—*Journal abstract*.

2933. Skolnick, Paul. (San Fernando Valley State Coll.) **Reactions to personal evaluations: A failure to replicate.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 62-67.—Attempted to replicate and extend the study by M. Deutsch and L. Solomon (see PA, Vol. 34:4179) which found that Ss who fail at a task rate negative (consistent) evaluations higher than positive (inconsistent) ones, and Ss who succeed at a task rate positive reactions from an evaluator higher than negative ones. 133 undergraduates were induced to believe that they failed or succeeded in an ambiguous ego-involving task. A control group was left uncertain as to how they performed. Ss then were evaluated by a note from a stooge. The Deutsch and Solomon results were not replicated. Contrary to consistency theory predictions, all Ss favored positive to negative evaluations, and Ss who failed at the experimental task were more appreciative of the positive feedback than were those who succeeded. An alternative theoretical explanation for the results is considered. (23 ref.)—*Journal abstract*.

2934. Stroebe, Wolfgang; Insko, Chester A., Thompson, Vaida D., & Layton, Bruce D. (U. North Carolina, Chapel Hill) **Effects of physical attractiveness, attitude similarity, and sex on various aspects of interpersonal attraction.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 79-91. Measured 100 male and 100 female undergraduates' attraction to opposite-sex others of either high, medium, or low physical attractiveness and of either similar, moderately similar, or dissimilar attitudes in terms of Ss' liking for other, of preference for other as a coworker, and of the

probability that S would consider other as a dating or marriage partner. Major results indicate that Ss' attraction was greater to physically attractive rather than unattractive and to similar rather than dissimilar others. Similarity had a greater effect for females than males on liking and working, while physical attractiveness had a greater effect for males than females on working, dating, and marrying. Comparisons among the dependent variables revealed that physical attractiveness had a greater effect on dating than on liking or marrying for all Ss, although the difference was greater for males. Self-rating of attractiveness was found to be related to date selection. Relative to Ss who rated themselves as attractive, unattractive Ss were more likely to consider unattractive others and less likely to consider attractive others as a date.—*Journal abstract*.

2935. Swan, Andrew C. (George Peabody Coll. for Teachers) **Personality Integration and perceived behavior in a sensitivity training group.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3717-3718.

2936. Tedeschi, James T., Bonoma, Thomas, & Novinson, Noel. (U. Miami) **Behavior of a threatener: Retaliation vs. fixed opportunity costs.** *Journal of Conflict Resolution*, 1970(Mar), Vol. 14(1), 69-76.—Replicated the study of M. Deutsch and R. M. Krauss (see PA, Vol. 35:4812) with a modified Prisoner's Dilemma game utilizing explicit threats. 15 male and 15 female undergraduates were assigned to 1 of 3 test conditions: unilateral threat—Ss could threaten and punish noncompliance by a simulated target (ST) at a fixed cost of 5 points; bilateral threat—Ss could issue threats and punish noncompliance but the ST had retaliatory power which cost the S 5 points; and control with an ST playing 50% cooperative strategy. Analyses of test scores and results from a semantic differential questionnaire indicate that: (a) the ST was considered less potent in the unilateral test condition than in either of the other 2 conditions; (b) Ss chose to penalize STs more often in the retaliatory condition; (c) the use of threats did not affect the overall competitiveness or winnings; and (d) males cooperated less, won more, and were generally more aggressive than females in the use of threats and penalties. The interpretations of Deutsch and Krause are supported. Several hypotheses concerning the Ss' behavior are presented and discussed.—*S. Knapp*.

2937. Tepper, Brenda S. **Contrast and assimilation effects in dyadic interaction.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3718.

2938. Tesser, Abraham. (U. Georgia) **Evaluative and structural similarity of attitudes as determinants of interpersonal attraction.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 92-96.—Presented 22 undergraduate males with 6 attitudes of 4 bogus others. These attitudes varied in terms of evaluative and structural similarity to each S. Evaluative similarity was manipulated by varying the number of similar attitudes 4 or 2, and structural similarity was manipulated by varying the pattern of similar/dissimilar attitudes. These manipulations were based on the responses of each S on a preliminary questionnaire. As predicted, Ss were able to perceive differences in structural similarity ($p < .01$), and attraction was positively related to both structural ($p < .05$) and evaluative ($p < .01$) similarity.—*Journal abstract*.

2939. Wolosin, Robert J., Sherman, Steven J., & Mynatt, Clifford R. (Indiana U.) **When self-interest**

and altruism conflict: Diffusion of responsibility and victim retribution. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 339-340.—Individuals and groups decided between helping themselves while hurting another or helping another at a cost to themselves. Groups chose to hurt others more than individuals, thus, lending support to diffusion of responsibility in group decision-making. When the victims of individual and group decisions were given the opportunity to gain retribution, however, group members were punished somewhat more for their decisions than individuals. Thus, group members are held at least as responsible for their decisions as individuals, and the decrease in responsibility shown by group members is not mirrored by a decrease in socially attributed blame.—*Author abstract*.

Influence & Communication

2941. Argyle, Michael, et al. (U. Oxford, Inst. of Experimental Psychology, England) **La communication des attitudes d'infériorité et de supériorité par signaux verbaux et non verbaux.** [The communication of inferiority and superiority attitudes by means of verbal and nonverbal signals.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(9-10), 540-548.—18 videotapes were prepared in which 2 young women presented attitudes of superiority, inferiority, and neutrality both verbally, by means of prepared statements, and nonverbally by means of action alone. 20 male and 20 female adults were asked to rate the attitudes, which were defined by 10 descriptive dimensions, on a 7-point scale following each presentation of a videotape. Ss later were administered the Neuroticism and Extraversion scales of the MPI, the Psychopathic Deviate scale of the MMPI, and an "anomie" scale. Data analysis demonstrated that women are relatively more affected by nonverbal signals than men. Neurotics were significantly more troubled by stimulus inconsistencies ("doubles") and were more sensitive to verbal signals. (18 ref.)—*R. E. Smith*.

2942. Bennett, Charles R. & Lindskold, Svenn. **Procedural artifact in risky-shift research.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 249-250.—It was hypothesized that the size of the group and the time spent in discussing 6 choice dilemmas items would be positively related to the magnitude of risky shift. 96 females were used in a 2×2 factorial design. 4- or 8-person groups discussed, without the requirement of consensus, each of the items for either 3 or 9 min. The hypotheses were disconfirmed; the results indicate that large groups and long periods of deliberation inhibit the shift to risk. The theoretical and practical implications of these results are discussed.—*Author abstract*.

2943. Bragg, Barry W. (U. Toronto, Ontario, Canada) **Resistance of conformity pressure without social support.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 363-364.—Previous attempts to obtain a generalization of the social support effect (reduced conformity) after the removal of the social supporter have failed. Several theoretical interpretations of the psychological effect of

the social supporter suggest that it might be impossible to obtain the effect. The 2 experiments ($N = 126$ undergraduates in Exp. I and 60 high school students in Exp. II) presented in this paper find a generalization of the social supporter effect after removal of the supporter. An explanation of the psychological effect of the social supporter is offered.—*Author abstract.*

2944. Brewer, Robert E., Terris, William, & Dunn, Thomas. (De Paul U.) **Stimulus ambiguity and discrepant information in judgment formation and change.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 389-390.—2 experiments studied effects of discrepancy, stimulus ambiguity, and number of persons giving discrepant information on change in judgments of a mean. In Exp. I, 104 Ss participated in a factorial design (2 levels of ambiguity, 3 levels of discrepancy, and 2 levels of number of confederates); in Exp. II, 98 Ss were exposed to 1 of 5 levels of discrepancy. The 2 experiments show a curvilinear relationship between change and discrepancy with height and breadth of inverted U curves determined by stimulus ambiguity. The results suggest stimulus ambiguity as a simpler explanation of data usually accounted for in terms of involvement.—*Author abstract.*

2945. Goodale, James G. & Flanders, James P. (Bowling Green State U.) **Predicting and explaining risky and cautious shifts with situational stimuli.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 253-254.—The main hypothesis was that 4 experimental conditions are necessary for risky or cautious shifts to occur. 120 coeds served in a $2 \times 2 \times 2 \times 3$ factorial design. Risky and cautious shifts appeared under optimal conditions, but removal of any of the experimental conditions eliminated shifting, thus confirming the hypothesis. In addition, features of dilemmas commonly used to study group risk taking were scaled, intercorrelated, and combined in a utility ratio to predict Ss' recommendations to hypothetical persons ($r = .77$) and shifts in their advice resulting from group discussion ($r = -.84$).—*Author abstract.*

2946. Heron, John. (U. Surrey, Guildford, England) **The phenomenology of social encounter: The gaze.** *Philosophy & Phenomenological Research*, 1970(Dec), Vol. 31(2), 243-264.—Distinguishes between physical and psychological dimensions in eye contact between 2 persons. Argues that the gaze represents a basic, unique phenomenal category. 3 striking features of the gaze are examined: its luminosity, its streaming quality, and its meaning. It is concluded that there can be a science of human relations conceived in terms of a much more radically constituted empiricism.—*L. J. Cantoni.*

2947. Leathers, Dale G. (U. California, Los Angeles) **Process disruption and measurement in small group communication.** *Quarterly Journal of Speech*, 1969(Oct), Vol. 55(3), 287-300.—Hypothesized that: "High-level abstractions, low-level abstractions, unequivocal personal commitments, implicit inferences, and facetious interpolations each produce measurably different effects on the communication that follows their introduction into a problem-solving discussion." Stimulus statements reflecting these types of statements were presented to 20 discussion groups composed of 2 male and 2 female undergraduates and 2 confederates. The 2 confederates systematically introduced the 5 stimuli statements and 2 trained judges rated the feedback. Results confirm the

hypothesis with high-level abstraction being rated as the most disruptive. Feedback following high-level abstraction was confused, tense, and withdrawn; following implicit inferences it was signal, irrelevant, and digressive; and following facetious interpolation, it was personal and inflexible.—*S. Knapp.*

2948. Levy, Stephen J. & Atkins, Alvin L. (Albert Einstein Coll. of Medicine, Yeshiva U.) **An empirical investigation of disclosing behavior in a verbal encounter group.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 297-298.—The encounter-type group represents a contemporary form of small group interaction which is being offered as an approach to a wide range of social ills. This study represents an effort to investigate this unique type of setting, using empirical tools drawn from the field of group dynamics. The areas under study are: (a) the relative success of several encounter groups; (b) the effects of an important variable for the group setting, self-disclosing behavior; and (c) a comparison of the results with that of a group organized to discuss women's liberation but without the emphasis on an encounter approach. Results "demonstrate strong support for the contention that the AST [attitudinal skills training] philosophy, methodology, trainers, and demand characteristics are necessary for the achievement of such goals as greater self-awareness, etc."—*Author abstract.*

2949. Lewis, Steven A. & Pruitt, Dean G. (State U. New York, Buffalo) **Orientation, aspiration level, and communication freedom in integrative bargaining.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 221-222.—Integrative bargaining may be viewed as a process in which alternatives are found that provide greater benefit to both parties than those initially known. The present study ($N = 92$ male undergraduates) examined the effect of 3 variables—orientation (a distributive, in which persons consider their own needs only vs. a problem solving, in which the other person's needs are also considered), aspiration level (high vs. low), and communication freedom (free vs. restricted) on the integration process. Results indicate that when high goals are coupled with a problem-solving orientation high level agreements are obtained. High goals and a distributive orientation increase the occurrence of negotiation collapse.—*Author abstract.*

2950. Lewit, David W. & Saville, Margaret R. (U. Hawaii) **Can groups be conservative? The case of realism.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 251-252.—The rarity of conservative shifts in the group decision literature is attributed in part to limitations of the Wallach-Kogan-Stoner procedure, especially the hypothetical quality of the problems, the lack of relationship between the S and the advisee, and the lack of norms within the S group. A significant conservative shift was found by presenting 2 Wallach and Kogan problems in narrative form in a televised interview. 48 groups of 5 female undergraduates each ($1/2$ of Japanese ancestry, $1/2$ of Caucasian ancestry) were Ss. Conservative shift was found when advisee and Ss were of the same race (Oriental or Caucasian), but not when they were of different races, or when the narrative was presented as a typewritten transcription.—*Author abstract.*

2951. Rubin, Jeffrey Z., Mowbray, Carol T., Collett, Lora J., & Lewicki, Roy J. (Tufts U.) **The perception of**

attempts at interpersonal influence. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 391-392.—Examined the extent to which persuasive communications sharing a common intent are differentially perceived as a function of their implied reinforcement contingencies and semantic structure. A questionnaire was administered in which Ss were asked to evaluate 8 hypothetical influence statements from both a sender's and receiver's vantage point. Findings indicate that communications of contingent reward or nonpunishment are seen as more attractive than those expressing contingent punishment or nonreward. The former were rated as more likely to gain compliance and to engender positive affect. A 3-dimensional structural model for the study of simple influence statements is briefly developed.—*Author abstract.*

2952. Smith, R. Bob. (State U. New York, Albany) **Coercive influence as a function of frustration and fantasy aggression.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 231-232.—Investigated the influence of frustration and fantasy aggression upon a source's exercise of coercive power. $\frac{1}{2}$ of the Ss were frustrated and $\frac{1}{2}$ were not; further, each of these 2 groups were subdivided into those Ss who were given the opportunity to express fantasy aggression and those who were not. All Ss were then given coercive power (in the form of threats and punishments) in a conflict-of-interests interaction. Frustration caused Ss to establish higher credibility for their threats, and the opportunity to express aggression in fantasy had an accommodative effect on the use of coercive power.—*Author abstract.*

2953. Stone, Vernon A. (U. Wisconsin) **Individual differences and inoculation against persuasion.** *Journalism Quarterly*, 1969(Sum), Vol. 46(2), 267-273.—A study concerned with inoculation strategies and individual differences in recipients was conducted on 108 male and 148 female college-age Ss. Base-line measures were used to establish source-message orientation and self-esteem and all experimental cells were balanced for sex. Each S served in all conditions: source inoculation, message inoculation, and attack-only control. Source and message inoculation strategies conferred immunization but neither source-message orientation nor sex yielded the predicted attitude change interaction. Source inoculation was effective for persons with low self-esteem and message inoculation conferred immunization for both kinds of persons. Message rather than source inoculation tended to be more effective regardless of recipient. *J. A. Kline*

2954. Wallace, William F. (U. Alabama) **Primacy and recency warnings and order effects in persuasive communications.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4375.

Social Perception & Motivation

2955. Albert, Stuart. (City Coll., City U. New York) **Motivational properties of observed competition.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 347-348.—Presents 2 studies (N = 400 New York pedestrians) investigating the motivational implications of competition. The goal was to generate a paradigm to document the greater motivational potential of competition as compared to noncompetition by noting the

increased frequency of a response that was functionally attached to competition as a choice situation. A preference for competitive vs. noncompetitive choice was documented (1 wk. before a mayoralty election) and attributed to the activation of a set of cultural values that selectively reinforce certain kinds of choices and not others. The cross-cultural and value implications of the paradigm are pointed out.—*Author abstract.*

2956. Banikiotes, Paul C., Russell, John M., & Linden, James D. **Interpersonal attraction methodology: Oversimplified or related to real interaction?** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 279-280.—Tested the assumption that an individual responds the same way to a test protocol as he would respond in a real-life situation to the individual depicted by the protocol. In order to test this assumption, interpersonal attraction methodology and sociometric ratings were contrasted. Ss were 44 18-22 yr. old male members of an undergraduate living group (cooperative). Some evidence was found to support the assumption tested with regard to an attitude measure (Attitude Survey). Topic importance, however, was found to be critical in determining attraction in real-life relationships. The assumption tested received inconsistent support with regard to a personality measure (Eysenck Personality Inventory).—*Author abstract.*

2957. Barazani, Ronald W. **Attribution of attitude as a function of perceived choice, normativeness, and strength of conviction in behavior.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3686.

2958. Becker, Lee A. (Ohio State U.) **Component response characteristics in impression formation.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4353.

2959. Berkowitz, William R., Nebel, Jeffrey C., & Reitman, Jonathan W. (U. Massachusetts, Boston) **Height and interpersonal attraction: The 1969 mayoral election in New York City.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 281-282.—Ss do tend to choose friends close to themselves in physical height; in this study, it was hypothesized that voters would prefer candidates of relatively similar height. 276 male pedestrians were interviewed just prior to the 1969 mayoral election in New York City, where the leading candidates were John Lindsay (6' 3") and Mario Procaccino (5' 6"). Ss reported both their own height and their voting preference. Shorter Ss were about evenly divided, taller Ss preferred Lindsay by 3:1. Results are discussed in terms of a 2-factor theory of attraction, where both absolute qualities and relative similarity of qualities are salient.—*Author abstract.*

2960. Berman, John J. & Brickman, Philip. (Northwestern U.) **Standards for attribution of liking: Effects of sex, self-esteem, and other's attractiveness.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 271-272.—A computer dating situation was employed to assess the effects of the sex and self-esteem of perceivers and the attractiveness of the persons perceived, on both attributions of liking and standards for attribution. It was hypothesized that attribution standards would be better measures of Ss' realistic expectancies of being liked than actual attributions. Males and Ss matched with an attractive other attributed greater liking to the other; females, low self-esteem Ss, and again Ss matched

with an attractive other reported stricter attribution standards. Differences are taken to indicate that attribution standards may be especially useful as indicators of the reasoning behind attributions of liking.—*Author abstract*

2961. Bickman, Leonard. (Smith Coll.) The effect of different uniforms on obedience in field situations. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 359-360.—Concern over methodological difficulties encountered in laboratory studies of obedience made it desirable to examine obedience in a field situation. It was hypothesized that the dress of another person can serve as a cue for obedience. It was predicted that compliance to an order would be related to the degree of authority represented by the E's uniform. Results from 3 field situations showed that a demand from a person in a guard's uniform was obeyed more frequently than a demand from a person in civilian dress. The data are examined in terms of social power theory.—*Author abstract*

2962. Brenner, Malcolm. (U. Michigan) Caring, love, and selective memory. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 275-276.—48 17-24 yr. old dating couples showed specific memory distortions when their girlfriend or boyfriend performed in their presence, but no distortions when a stranger performed. These distortions were related to the length of the relationship, to touching behavior, to Rubin love scores, and to both self-report and behavioral measures of caring for the dating partner.—*Author abstract*

2963. Brown, Bert R., Garland, Howard, & Mena, Manuel. (Cornell U.) Effects of another's dependency and expectations of meeting with him on the reduction of face-saving behavior. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 299-300.—A 2 x 2 factorial experiment was conducted to determine effects of an intervention designed to reduce face-saving in a situation which normally produces high face-saving. Face-saving, defined as sacrificing tangible (monetary) rewards to avoid public embarrassment, was measured by time Ss performed embarrassing task publicly. Lowest performance increased payoff. It was hypothesized that face-saving is reduced when (a) another is dependent on S for his payoff, and (b) S expects to meet other afterwards. Significant main effects confirmed the hypotheses. The results were interpreted in terms of arousal by not helping a dependent other and further embarrassment at confronting him afterwards.—*Author abstract*

2964. Bryan, James H., Gault, Una, & Barnett, Mark. (Northwestern U.) Effects of preachings, practices, and hypocrisy on adult judgments of the exemplar. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 341-342.—Assessments were made of the effects of exhortations and practices concerning altruism and the inconsistency of the two, upon adults' judgments of an exemplar. Ss were shown a videotape scene in which a model did or did not contribute to charity. With each of these 2 groups, 1/2 of the Ss heard the exemplar extol the charity, another 1/2 heard her indicate the desirability of retaining her winnings, and the remaining Ss heard the exemplar verbalize normatively neutral material. Ss then rated the exemplar on a variety of adjectives. The main

effects of preachings and practices were significant. No interaction of hypocritical effects were found.—*Author abstract*

2965. Fine, Robert H. & Lindholm, Steven. Subjects' experimental history and subject-based artifact. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 299-290.—Ss were provided experimental history of participation in 2 experiments involving deception, nondeception, or 1 of each. A subject's decision to participate was intended. The 1st criterion was a measure of tasks providing measures of truthfulness, honesty, honesty, negativism, and evaluation appropriate. Compared to the nondeception group, deception group resulted in higher scores. Both groups showed mixed deception, resulted in greater evaluation of deception than the other 2 groups. The 1st criterion of the faithful S was rejected, suggesting that the 1st criterion be a simple matter of truth or honesty.—*Author abstract*

2966. Fischer, Edward H. (Cornell U.) Altruistic attitudes and volunteering for companionship with mental hospital patients. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 343-344.—During the 1st recruitment, community college students volunteered to join a computer group, participate in a study, or later participate in a study. Ss were assessed for social desirability. Of several dimensions, the 1st dimension analyzed (birth order, religion, socioeconomic class) only 1 was distinguished, voluntariness from the 1st group (p < .0001). Greater social desirability and higher attitudes correlated significantly with higher volunteering. That did not apply to the 2nd group. A 2nd intervention in which Ss were asked to volunteer for a study had moderate scores and 1/2 of the Ss volunteered. The last finding suggests that a 1st intervention factor rather than specific factors caused the volunteering intervention.—*Author abstract*

2967. Jones, Russell A. & Ashmore, Richard D. (University of Illinois) Dimensions underlying the perceptions of national, religious and other ethnic groups. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 341-342.—A study was conducted to determine the underlying dimensions of the perceptions of national, religious and other ethnic groups. Ss were shown a videotape scene in which a model did or did not contribute to charity. With each of these 2 groups, 1/2 of the Ss heard the exemplar extol the charity, another 1/2 heard her indicate the desirability of retaining her winnings, and the remaining Ss heard the exemplar verbalize normatively neutral material. Ss then rated the exemplar on a variety of adjectives. The main

effects of preachings and practices were significant. No interaction of hypocritical effects were found.—*Author abstract*

2968. Kasper, Anthony A., Maier, Richard A., & Johnson, James I. Perception of physical attractiveness: The influence of group interaction and group cohesion on ratings of women. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 317-318.—Investigated the influence of group interaction and group cohesion on ratings of women's faces to 53 females and 53 males; the attractive-

ness of each photograph was rated by each S in a coaction setting and, then, in either a group interaction setting where a consensus rating was required, or a coacting setting a 2nd time. The interacting Ss gave the photographs a significantly lower rating on the 2nd (critical) viewing than the coacting Ss, suggesting that group interaction functions to lower ratings of attractiveness.—*Author abstract.*

2969. Lewicki, Roy J. (Yale U.) **The effects of exploitative and cooperative relationships on subsequent interpersonal relations.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 225-226.—Explored the impact of conducting either a successfully exploitative or cooperative relationship on the actor's subsequent behavior. Experimental Ss were induced to successfully exploit or cooperate with another person, and then given information about a 2nd other in a new task. For previously exploitative Ss, subsequent exploitation was maximally elicited when no information about the other was given; previously cooperative Ss cooperated most with a similar other. Recent evidence, suggesting that socially undesirable behavior is facilitated when the other is anonymous, was cited to explain the behavior of the exploitative Ss.—*Author abstract.*

2970. Merenda, Peter F., Shapurian, Reza; Bassiri, Torab, & Clarke, Walter V. (U. Rhode Island) **Iranian perceptions of the Reza Shah and President Johnson.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 239-241.—56 faculty members of an Iranian university were asked for their perceptions of the public image of the Reza Shah, the Great, and of President Johnson. The instrument used in obtaining these public image profiles was the Activity Vector Analysis (AVA). Findings showed a very tight cluster around AVA "Administrative Pattern" for perceptions of the Reza Shah and a less tight cluster about the same reference pattern for perceptions of President Johnson in terms of profile shape. Differences in profile scatter and elevation, however, were noted. As expected the Iranian nationals yielded significantly higher scatter and elevation scores in their perceptions of the Shah.—*Journal abstract.*

2971. Nelson, Don A. & Meadow, Barry L. (Purdue U.) **Attitude similarity, interpersonal attraction, actual success, and the evaluative perception of that success.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 283-284.—Ss differing in the degree to which they were led to believe that a stranger's attitudes were similar to their own worked together on an actual task, the success of which depended upon their ability to work together. Each pair of Ss was independently varied so as to believe that their partner's similarity was either high or low. Thus, the independent categories of similar-similar, dissimilar-dissimilar, and similar-dissimilar were established. Significant differences were found in task success and the perception of team success and the partner's contribution to that success. Hypothesized differences were found for within independent groups.—*Author abstract.*

2972. O'Brien, Gregory M. (Boston U., Graduate School) **The effects of information accessibility and Machiavellianism on interpersonal perception and bargaining behavior.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3041.

2973. Parrott, George L. & Coleman, Georgetown. (Sacramento State Coll.) **Sexual appeal: In black and white.** *Proceedings of the Annual Convention of the*

American Psychological Association, 1971, Vol. 6(Pt. 1), 321-322.—Facial pictures were ranked from characteristically Negro to clearly white and organized into 3 comparable 6-picture sets of male and female photographs. Pictures were rated for sexual appeal by opposite-sex raters; the raters were either Negro or white. Results show no sexual appeal effect due to physical characteristics of face for female raters, but a strong affect for males. Negro and white males show the same basic response pattern on their ratings while Negro females gave generally lower ratings to all pictures than white females.—*Author abstract.*

2974. Raymond, Beth J. & Unger, Rhoda K. **The effect of deviant and conventional attire on cooperation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 357-358.—2 studies were conducted to determine whether deviantly dressed youths would receive differential cooperation as compared to their conventionally dressed Negro and white counterparts. Results indicate that white Ss complied less with the requests of both Negro and white deviants than with the requests of their conventional counterparts. Negro Ss cooperated with the white deviant to the same extent as the white Ss did; however, they cooperated more with the Negro deviant. The results are explained in terms of Rokeach's theory of belief congruity.—*Author abstract.*

2975. Regan, Judith W. (Wells Coll.) **Guilt, perceived injustice, and altruistic behavior.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 124-132.—Hypothesized that 2 separate mechanisms may lead to altruism after harm-doing: expiation of guilt and attempts to bolster belief in a "just world." 37 male and 47 female undergraduates served as Ss. For 56 Ss the experiment in which they were participating was ruined: 28 Ss were led to believe that their own negligence caused the misfortune, and 28 Ss were not at fault (responsible and witness conditions). As expected, Ss in both conditions contributed to a charitable fund more than controls, for whom no misfortune occurred. To distinguish between the guilt and just-world mechanisms, $\frac{1}{2}$ the Ss were encouraged to cathart and/or rationalize their guilt in an interview. As predicted, this experience did not affect the altruism of Ss in the witness condition, but did reduce altruism in responsible-condition Ss. Internal analyses further strengthened the thesis that guilt is the source of altruistic acts in Ss who cause harm, and perceived injustice is the motive in witnesses.—*Journal abstract.*

2976. Reznikoff, Marvin & Hirsch, Tannah. (Fordham U.) **Over troubled water.** *Psychology Today*, 1970(May), Vol. 3(12), 36-39.—Contract bridge requires both an analytical grasp of the technical aspects of the game and an understanding of the psychological nature of one's partner and opponents. Thus, bridge "inspires litigation, accusation, addiction, tribulation, recrimination, vexation...and an occasional murder."—E. J. Posavac.

2977. Richman, Joel. (Syracuse U., Psychological Research Center) **The concept of cooperation in the Prisoner's Dilemma and other tasks: Some need structure correlates.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 227-228.—Investigated the relationships between behavior in the Prisoner's Dilemma game (PDG), perception of human nature, and other tasks relevant to the study of cooperative behavior. Principal component analyses for each sex indicated that 4 measures of the perception of human nature were highly

related. 2 traditional PDGs defined a 2nd factor. The last 2 factors were defined by a measure of altruism and a mock PDG, respectively. The different indices of cooperation were seen to be unrelated to one another and to the perception of human nature. Subsequent analyses showed no stable relationships between need structure and cooperative behavior, although need structure was useful in the prediction of attitudes concerning the nature of other people.—*Author abstract.*

2978. Rosen, Sidney & Tesser, Abraham. (U. Georgia) **Fear of negative evaluation and the reluctance to transmit bad news.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 301-302.—Attempted to determine whether reluctance to transmit an overheard message intended for a stranger depends on fear of negative evaluation by, and the message's anticipated consequences for, that stranger. It was reasoned that a messenger would fear negative evaluation if he were identifiable by the recipient. The hypothesis that bad news would be transmitted less completely and spontaneously than good news was supported. Unexpectedly, anonymity did not interact with news content. Instead, greater communication occurred under nonanonymity than anonymity. These findings, along with some supportive correlational data, were reinterpreted from an attribution-theoretical viewpoint.—*Author abstract.*

2979. Scherer, Klaus R. (Harvard U.) **Attribution of personality from voice: A cross-cultural study on interpersonal perception.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 351-352.—American and German listener-judges rated personality traits of American and German speakers on the basis of content-masked voice samples. Using peer ratings as external personality criteria, it was found that American judges accurately attributed extroversion to American speakers and assertiveness to German speakers, and that German judges accurately attributed conscientiousness, emotional stability, and assertiveness to German speakers. Results are discussed in terms of modal personality patterns affecting the availability of expressive cues in speakers' voices, the sensitivity of listeners to such cues, and the congruence between cognitive inference structures of listeners and empirical voice-personality covariations.—*Author abstract.*

2980. Schlenker, Barry R., Brown, Robert, & Tedeschi, James T. (State U. New York, Albany) **Subjective probability of receiving harm as a function of attraction and harm delivered.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 285-286.—Ss were asked to estimate the probability that a liked or disliked confederate would deliver shock on each of 10 trials. Ss received 1, 5, or 9 shocks. An interaction between attraction and actual probability of shock was found on probability estimations. Ss in the low attraction-90% probability condition estimated greater probabilities of shock than Ss in either low attraction-10% or high attraction-90% conditions. Postinteraction measures indicated that liking for the confederate was determined by initial liking and was inversely related to number of shocks received.—*Author abstract.*

2981. Schneider, David J., et al. (Amherst Coll.) **Effects of visual contact on verbal self-presentation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 303-304.—It was hypothesized that Ss would be less positive

in their self-presentations when they were uncomfortable. It was assumed that Ss would be relatively uncomfortable when they could not be seen by and see (monitor) an interviewer. Results indicate that they were more positive when they could be seen and when they could not see the interviewer. These results do not seem to be a function of comfort in the situation, and a tentative explanation based on informational advantage and disadvantage is advanced.—*Author abstract.*

2982. Squier, Roger W. (Stanford U.) **The effect of feedback information and behavior consistency on accuracy of social prediction.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 255-264.—120 male undergraduates predicted a stimulus-person's responses to the EPPS. The amount of feedback given the Ss about the stimulus-person's responses was varied, and the degree of consistency in his responses was measured. Ss' predictive accuracy was increased by feedback only when the stimulus-person's responses were consistent, and was decreased by feedback when they were inconsistent. Results of the study were consistent with a probabilistic, expectancy theory of interpersonal perception.—*Author abstract.*

2983. Steele, John M. (U. Oklahoma) **Cue interactions in the attitudinal stereotyping of schematized faces with variations of head and facial hair.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3044.

2984. Stein, R. Timothy. (U. Delaware) **Accuracy in perceiving emergent leadership in small groups.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 295-296.—Studied accuracy in perceiving emergent task and socioemotional leadership. 149 undergraduates viewed a videotape of a small leaderless task group and guessed the order in which the group would rank its members on leadership functions. Tapes of 6 groups were used. Ss' judgments were accurate ($p < .01$). Accuracy was highly correlated with the agreement among stimulus group members in their rankings of each other. Data suggest some generalized ability to perceive group structural variables. Accuracy appears to result primarily from personal evaluations rather than from knowledge of how the group members evaluate each other.—*Author abstract.*

2985. Wahler, H. J. (Washington State Div. of Institutions, Office of Research, Ft. Steilacoom) **Winning and losing in life: A survey of opinions about causes.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 91-95.—A survey of nonprofessional personnel at a mental hospital in regard to "5 personal characteristics or conditions that you feel are essential for people to cope successfully and get what they want from life," and "most important causes for people defeating themselves and failing to get what they really want in life" (losing). Responses indicate that "Winning is associated with concepts implying the Protestant ethic." "Losing" statements were classed as expressing a socially undesirable attribute, and lack of some desirable characteristic. The terms "winning" and "losing" are interchanged with mental health and mental illness. A. M. Cawley.

COMMUNICATION

2986. Bickley, A. C., Ellington, Billie J., & Bickley, Rachel T. (Moorehead State U.) **The cloze procedure: A conspectus.** *Journal of Reading Behavior*, 1970(Sum),

Vol. 2(3), 232-249.—Presents brief reviews of research on the cloze procedure, especially those references concerned with readability, comprehension, language, and methodological aspects of constructing and scoring cloze tests. (6 p. ref.)—*W. L. Chovan.*

1987. Bükky, Béla. (Hungarian Academy of Sciences, Budapest) **A kommunikáció-kutatás legfőbb megállapításai, valamint néhány példa ezek nyelvészeti, pedagógiai és pszichológiai alkalmazására.** [The main results of communication research, and some examples of their linguistic, educational and psychological application.] *Pszichológiai Tanulmányok*, 1967, No. 10, 147-151.

1988. Chombart de Lauwe, Marie J. (National Center of Scientific Research, Paris, France) **L'image de l'enfant et sa signification personnelle et collective.** [The child's image and its personal and collective significance.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(11-12), 614-620.—Writers and film-makers possess the capability of "fixing" representations of the world as well as controlling the impact of these representations on both a personal and collective basis. The study of these representations helps in the understanding of children's social integration and their identification with the portrayed models. The "child image" as created for an adult audience, the portrayal of adults to children, the identification frustration (mythization) the child encounters when he discovers the real world, and the values systems involved are discussed.—*R. E. Smith.*

Language

1989. Anderson, Norman H. (U. California, La Jolla) **Two more tests against change of meaning in adjective combinations.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 75-85.—Describes 2 experiments with 224 undergraduates. No-Paragraph Ss formed an impression of a person described by 3 trait-adjectives, rated the person on likableness, and then rated each component trait. Paragraph Ss were treated identically after writing a paragraph describing the person in their own words. A strong positive context effect was obtained. Component ratings were displaced toward the values of the other traits; quantitatively, this effect followed the parallelism prediction of information integration theory. Since this positive context effect was equal for Paragraph and No-Paragraph conditions, it was interpreted as a generalized halo effect, not as contextual change of meaning. A 3rd experiment with 40 undergraduates obtained greater context effect for larger sets of equal-valued traits, casting doubt on an assimilation of meaning explanation. Limitations on the results are noted. (28 ref.)—*Journal abstract.*

1990. Dalrymple-Alford, E. C. & Aamiry, Arwa. (Trent U., Peterborough, Ontario, Canada) **Word associations of bilinguals.** *Psychonomic Science*, 1970(Dec), Vol. 21(6), 319-320.—176 Arabic-English bilingual undergraduates gave a greater number of identical associations when they responded to the same word twice, than when they responded the 2nd time to the translation of the stimulus word. It is suggested that this result may be due to translation equivalents having the status of synonyms and not to bilinguals' setting up associations independently in each language.—*Journal abstract.*

1991. Danks, Joseph H. & Glucksberg, Sam. (Kent State U.) **Psychological scaling of adjective orders.**

Journal of Verbal Learning & Verbal Behavior, 1971(Feb), Vol. 10(1), 63-67.—Investigated whether violations of implicit adjective-ordering rules affect scalings of grammaticality. 51 undergraduates ranked sentences containing 1 of 6 different orders of 3 prenominal adjective classes, using a multiple rank ordering procedure. The scale values were consistent with expectations based upon the assumption that Ss integrate a pragmatic communication constraint and a semantic-grammatical rule. Implications for language research are discussed.—*Journal abstract.*

1992. Hamilton, Helen W. & Deese, James. (Johns Hopkins U.) **A study of associations to combinations of words.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 57-58.—Tested an aspect of an abstract feature model of semantic processing (see M. G. Johnson, PA, Vol. 44:15914) and examined the associative responses to marked and unmarked adjective triads. Predominantly noun associates occur even where the model predicts adjective responses. Ss were 100 undergraduates. Unmarked adjective triads elicited more positively evaluated associates for both noun and adjective response words. Marked triads elicited more negatively evaluated associates for adjectives. The evidence is negative for Johnson's model and suggests, instead, a model incorporating propositional reactions to the triads.—*Author abstract.*

1993. Kováč, Damián. (Slovak Academy of Sciences, Inst. of Psychology, Bratislava, Czechoslovakia) **A többnyelvűség pszichológiai aspektusai.** [Psychological aspects of multi-lingualism.] *Pszichológiai Tanulmányok*, 1967, No. 10, 51-58.

1994. McGinley, Hugh. (U. Wyoming) **Relationship between denotative and connotative meaning as an intrasubject phenomenon.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 207-211.—67 undergraduates responded to a multiple-choice type vocabulary test and then marked semantic profiles for stimulus words and response words which were selected from the test. Ss who responded correctly to stimulus words marked more similar semantic profiles between the stimulus words and their respective correct response words than Ss who missed the stimulus words on the test. Ss who incorrectly responded to stimulus words but who indicated that they knew the words and that their chosen responses were good synonyms of them, marked more similar profiles between the stimulus words and their chosen response words than between the stimulus words and the correct response words.—*Journal abstract.*

1995. Neelley, James N. & Vaughn, Bill E. (U. Kansas) **Visual discrimination of certain consonant sounds.** *Quarterly Journal of Speech*, 1969(Oct), Vol. 55(3), 301-307.

1996. Rubenstein, Herbert; Lewis, Spafford S., & Rubenstein, Mollie A. (Lehigh U.) **Homographic entries in the internal lexicon: Effects of systematicity and relative frequency of meanings.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 57-62.—In an experiment with 45 undergraduates, the task was to distinguish between English and nonsense words, which were displayed singly. The display persisted until S pressed the yes-key if he thought the stimulus was English or the no-key if he thought it was nonsense. In an earlier study it was found that the response time is shorter when the English word is a homograph than when it is a nonhomograph. The

present study shows that this facilitating effect of homography is observable when the meanings of the homograph (a) are not systematically related, and (b) tend to equiprobability.—*Journal abstract.*

2997. Shapiro, S. I. & Gordon, G. Paul. (U. Hawaii) **Contemporary norms of word and phonetic frequencies.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 92-94.—Discusses recent sources of normative word and phonetic frequency data, including an easily available source of American English word frequencies compiled by H. Kučera and W. N. Francis, and phonetic frequency data compiled by A. H. Roberts.—*Journal abstract.*

2998. Steinberg, Danny D. (U. Hawaii) **On semantic sentence categories.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 45-46.—The validity of the semantic sentence categories of informative, redundant, contradictory, and amphigorous (categories derived from the analytic-synthetic distinction and the philosophical notion of "meaninglessness") was investigated, as was the effects of negation and the truth-value assigned such categories. The findings strongly support the validity of the categories and establish various systematic relations among the categories with negation. Analysis unexpectedly showed that contradictory sentences never involved a semantic feature conflict on animateness or humanness but that amphigorous sentences always did. Contrary to Pap's thesis, affirmative amphigorous ("meaningless") sentences were rated as false and their negations as true.—*Author abstract.*

Psycholinguistics

2999. Donley, Richard E. & Winter, David G. **Measuring the motives of public officials at a distance: An exploratory study of American presidents.** *Behavioral Science*, 1970(May), Vol. 15(3), 227-236.—Scored the inaugural addresses of American presidents from 1905-1969 for the need of achievement (n Ach) and the need for power (n Power), using procedures originally developed for scoring individual TAT protocols. The resulting motive scores are closely related to the consensus judgment of historians and political scientists concerning those presidential administrations. Thus the technique of scoring speeches for psychological imagery appears to be a promising way to measure the personality characteristics of significant political actors, who are usually unavailable for standard personality assessment procedures. The technique appears to have promise for predicting the future course of political action, given the motive scores of actors. Several methodological issues are discussed. (40 ref.)—*Journal abstract.*

3000. Goodman, Kenneth S. (Wayne State U.) **Psycholinguistic universals in the reading process.** *Journal of Typographic Research*, 1970(Spr), Vol. 4(2), 103-110.—Literate speakers in any language have 2 alternative surface language forms which are realizations of the same deep structure and which represent alternate encodings of the same meaning. For the proficient reader, written language becomes parallel to speech and not a secondary representation of it. Listening and reading are processes in which the language user may sample, select, and predict from the available signal. Readers are users of language who process graphic, syntactic, and semantic information simultaneously.

Readers develop strategies for the efficient sampling of the graphic signal in relation to the syntax of their language and the concepts and experiences with which the passage is concerned. The essential characteristics of the reading process are universal.—*Journal abstract.*

3001. Halwes, Terry & Jenkins, James J. (U. Connecticut) **Problem of serial order in behavior is not resolved by context-sensitive associative memory models.** *Psychological Review*, 1971(Mar), Vol. 78(2), 122-129.—Associative-chain theories have trouble accounting for the basic fact that the elements of behavior are ordered serially. W. A. Wickelgren (see PA, Vol. 43:6871) attempted to avoid these difficulties by postulating a "context-sensitive associative theory," "which assumes that serial order is encoded by means of associations between context-sensitive elementary motor responses." This reply argues that (a) such theories are not adequate to account for serial ordering and the other facts of speech production, (b) that arguments advanced in their support are incorrect, and (c) the nonassociative alternative considered and rejected by Wickelgren is in no way related to seriously held nonassociative theories.—*Journal abstract.*

3002. Ohnmacht, Fred W. (State U. New York, Albany) **Psycholinguistic research: A psychometric point of view.** *Journal of Reading Behavior*, 1970(Sum), Vol. 2(3), 213-220.—Assumes that individual difference variables are helpful in the explanation of linguistic behavior. An understanding of linguistic behavior can be improved if contributions from both experimental and psychometric approaches are considered. A "marriage" between experimental and psychometric values is proposed. (16 ref.)—*W. L. Chovan.*

3006. Henry, Otto W. (Tulane U.) **The evolution of idiomatic and psychoacoustical resources as a basis for unity in electronic music.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2957.

3007. Lindauer, Martin S. (State University Coll. New York, Brockport) **Preference for abstract art as a function of complexity and free and controlled exposure time.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 409-410.—Investigated preference for a sample of abstract art in 2 studies. In Exp. I, 43 volunteers from an advanced perception course were Ss; in Exp. II, 4 groups of 13 undergraduates each were Ss. The parameters of interest, related to general psychological issues as well, included stimulus complexity and the amount of free and controlled exposure time. Preference was minimally related to complexity, the latter arousing a strong and well-defined response. The duration of looking behavior

moderately but irregularly affected preference. The findings are discussed in terms of the ambiguous nature of an emotional evaluation of abstract art.—*Author abstract.*

3008. McWhinnie, Harold J. (U. Maryland) **Is psychology relevant to aesthetics?** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 419-420.—Reviews the issues involved in the question of the relevancy of psychological matters to questions of aesthetics. G. Dickie's 1962 paper on the relevancy of psychology to aesthetics sparked a considerable debate within both psychology and philosophy. Dickie's paper to some degree at least reflected a discouragement and disillusionment with over 50 yr. of research in empirical aesthetics and the psychology of art. Considering the fact that Dickie wrote in the early 1960s, such a disillusionment was no doubt justified; since the field of empirical aesthetics at that point in time in its historical development was truly "spinning its wheels in mud." However, recent work (since 1962) by Berlyne, Eisenman, Child, and McWhinnie necessitates a fresh look at the question as posed by Dickie. Psychological aesthetics needs to explore questions within the Eiland frame of reference. It ought to avoid studies such as: (a) factor analytic studies designed to assess some general aesthetic factor, (b) comparison of preference and/or judgments of naive Ss with expert judges, (c) large scale correlational studies with a multitude of variables compared, and (d) studies in which there is a lack of any clearly manipulated variables.—*Author abstract.*

3009. Peterson, John M. & Rudd, J. William. (U. Cincinnati) **Stimulus complexity and the cube: A handcarving task revisited.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 415-416.—From previous research and the "new look" in motivation theory, predictions were made about structural choices, product quality, and general design performance for advanced design students. A handcarving in a 6-in cube of wood was assigned to 4th-yr architecture students (most had done a similar task as freshmen). Though the quality of both sets of handcarvings reflected the ability of the designers, the 2 tasks appeared to be different. These advanced students tended to do better with complex cube edge combinations and contrary to prediction more selected these combinations. Also initial design performance tended to predict subsequent design performance.—*Author abstract.*

SMOKING & DRUG & ALCOHOL USE

3010. Baer, Daniel J. (Boston Coll.) **Political views of high school and college students and attitudes about legalization of marihuana.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 337-338.—Compared beliefs about the legalization of marihuana with political views for a sample of 1350 high school and college student users and nonusers of the drug. Conservatives in contrast to liberal nonusers of marihuana more likely agreed that users and sellers should be severely punished and less likely agreed that present penalties for users were too severe. However, for those Ss with some experience taking marihuana, no significant association occurred between political beliefs and response to these state-

ments. Results suggest that with regard to attitudes about legalization of marihuana and political views, experience with the drug is an important factor.—*Author abstract.*

3011. Chamberlin, Cecil. (Menninger Foundation, Children's Div., Topeka, Kan.) **Youth and drugs.** *Menninger Quarterly*, 1969(Win), Vol. 23(4), 12-21.—Outlines the developmental tasks of the adolescent as follows: (a) finding new ways of coping with inner tensions, (b) severing dependent ties with parents, and (c) establishing an identity. Drug usage is described as a possible method for youth to be antiadult and anti-establishment, to establish identity, to seek release from tensions, or to seek new and exciting experiences. The generation gap is discussed in terms of the difference between adolescent and adult values. It is suggested that in addition to his concern about young people who use drugs, the adult should also concern himself with bridging the generation gap. A project designed to establish communication between the generations is described.—*S. Knapp.*

3012. Grossman, Jan C., Goldstein, Ronald, & Eisenman, Russell. (Temple U.) **Openness to experience and marihuana use: An initial investigation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 335-336.—Studied personality correlates of nonusers and 3 groups varying in frequency of marihuana use. It was predicted and confirmed that as the level of marihuana use increased, adventuresomeness and creativity would increase, and authoritarianism would decrease. Also, regular marihuana users were found to be no more anxious or impulsive than nonusers. Biographical data revealed that males were heavier users than females, and Jews, heavier users than Catholics or Protestants. Users did just as well as nonusers academically. Results are discussed and explained by an "openness to experience" factor.—*Author abstract.*

3013. McGlothlin, William H., Arnold, David O., & Rowan, Paul K. (U. California, Los Angeles) **Marihuana use among adults.** *Psychiatry, Washington, D.C.*, 1970(Nov), Vol. 33(4), 433-443.—Examines data on marihuana use from a subsample of 247 persons who received LSD from physicians during the period 1955-1961. 108 Ss (44%) reported some experience with marihuana, and 29 of these began use prior to 1961 and used it regularly at some time. Of these 29, 14 were still using marihuana frequently and 7 were not using it at all. This group was composed of 22 males and 7 females, mean age 40, and all but 4 had attended college. 23 had at some time been heavy alcohol consumers and 20 had at some time shown frequent use of stimulants. It is concluded that alcohol and marihuana are likely to remain drugs of major social use in that they (a) "appeal to a relatively large proportion of the population; (b) ... are suitable for regular use over long periods of time; and (c) ... produce significant physical, psychological, or social behavioral change." (16 ref.)—*E. M. Uprichard.*

3014. Pillard, Richard C. (700 Harrison Ave., Boston, Mass.) **Marihuana.** *New England Journal of Medicine*, 1970(Aug), Vol. 283(6), 294-303.—Presents a summarization of what is known about marihuana, its derivation, and its chemical analysis. Physiological effects on animals and humans are described. Psychological effects and adverse psychological reactions are described. An idea of the prevalence of marihuana use is

given. There is a section on the legal status of marihuana. The inadequacy of a purely medical approach to the question of marihuana use is stressed. It is concluded that the "ultimate place of marihuana in our culture will reflect social as well as medical pressures." (92 ref.)—S. R. Diamond.

3015. Sadava, Stanley W. (U. Colorado) **College student drug use: A social psychological study.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3043.

3016. Sharoff, Robert L. (12 E. 86th St., New York, N.Y.) **Character problems and their relationship to drug abuse.** *American Journal of Psychoanalysis*, 1969, Vol. 29(2), 186-193.—Uses examples from history, theatre, motion pictures, and previous studies to characterize types of individuals who abuse various types of drugs. People who use alcohol or nonnarcotic sedatives are characterized as trying to resolve character problems related to conflicts of aggression and sexuality by acting them out. Narcotic drug addicts attempt to resolve a lack of self-esteem by withdrawal as well as by attacking society by the problems they create for it. Hallucinogen users are also characterized as having problems of self-esteem. However, drugs enable them to substitute love for competition while feeling, through perceptual distortion, that they have become what they believe they are in imagination.—M. Maney.

PERSONALITY

3018. Campana, Carole D. (Columbia U.) **Aspects of personality development in late adolescence and early adulthood.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4330-4331.

3019. Osipova, E. V. **Nekotorye problemy teorii lichnosti.** [Some problems pertaining to the theory of personality.] In G. V. Osipov (Ed.), "Sotsial'nye issledovaniya: Problemy truda i lichnosti." (See PA, Vol. 46: Issue 2) 5-37.—Describes a general type of personality in a capitalistic society as seen by Marx and Lenin and the formation process of a socialistic type of personality. The following factors were considered: (a) attitude of an individual towards society and work, (b) social environment and its effects, (c) structure of a personality, and (d) formation process of a personality in a communistic society. Marx and Lenin considered an individual in a capitalistic society to be living an egoistic life, to regard manual work as degrading, and whose future is predetermined by belonging to a certain social class. The 4-sided structure of a personality was considered, i.e., social background, temperament, experience, and individual characteristics. Formation process of a new man would include: overcoming of the ideological separation between the individual and his work; equalizing of opportunities, e.g., educational opportunities, social security, etc.; and participation in economic and political decision making.—I. Halev.

PERSONALITY TRAITS & PROCESSES

3020. Ace, Merle E. & Barth, Richard T. (U. British

Columbia, Vancouver, Canada) **Content and score as sources of response inconsistency.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt 1), 121-122. Reviews evidence indicating that response inconsistency is interpretable as a personality trait, rather than simply as an artifact of a psychometric instrument. 3 inventories were developed, 1 in each of 3 content areas. 3 types of scores were developed in each inventory. Results of 2 1-way repeated measurements designs, across scores, and across contents, show that scores and individual differences are about equally important as has been previously found, but that these contents did not contribute to inconsistency variance. Ss were 160 undergraduates. Response inconsistency thus may be attributable to the person responding.—Author abstract.

3021. Barthell, Charles N. (Northwestern U.) **Affiliation, birth order and extroversion-introversion.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4324-4325.

3022. Burnes, Kay; Brown, Walter A., & Keating, Gordon W. (National Inst. of Health, Bethesda, Md.) **Dimensions of control: Correlations between MMPI and I-E scores.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 301. Administered Rotter's Internal versus External Locus of Control (I-E) scale and the MMPI to 25 volunteer members of a suburban rescue squad. I-E scores correlated with 3 MMPI scales: negatively with the K and Hy scales and positively with the F scale. A comparison of these relationships with those found in a sample of alcoholics is made. It is suggested that the correlations observed indicate "that a sense of control over external events is related to self-control and competence in handling internal events."—S. Knapp.

3023. Cohen, David. **Personality of professionals.** *Science Journal*, 1971(Jan), Vol. 7(1), 85-87. Reviews the studies of Roe, McClelland, and Lidzson which were concerned with personality differences among professionals. Physicists and biologists tended to be isolated during childhood and become less person-oriented and more thing-oriented. Psychologists experienced great parental conflict but placed a high value on human relations. Business executives had high achievement needs. Artists displayed different thought patterns and a high degree of self-discipline. The author's preliminary research on actors indicated they were more sensitive, more neurotic, and more person-oriented than the control group. It is concluded that the profession one chooses is chosen because it enables one to resolve certain psychological problems.—A. Santi.

3024. Foulds, Melvin L. & Warchime, Robert G. (Bowling Green State U.) **Relationship between repression-sensitization and a measure of self-actualization.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 287-289. Tested 55 male and 55 female undergraduates on Byrne's Repression Sensitization (R-S) scale and the Personal Orientation Inventory (POI), a measure of self-actualization, to determine the relationship between these variables. Findings reveal significant sex differences on 10 of 12 POI scales with females scoring higher than males. All 12 POI scales were found to be negatively and significantly related to female R-S scores and for total Ss and all but 2 of the comparisons were significant beyond the .001 level. Results provide additional confirmation of the hypoth-

esis that the relationship between R-S and personal adjustment may be linear. (23 ref.)—*Journal abstract.*

3029. Horner, Matina. (U. Michigan) Fall: Bright women. *Psychology Today*, 1969(Nov), Vol. 3(6), 36-38, 62.—The general hypothesis that women possess a motive to avoid success was tested with 90 female and 88 male undergraduates. Stories which were written about a female (or male) who finished at the top of her (or his) medical school class indicated that, compared to males, females fear rejection after a success, worry about the definition of their sex, or distort the success. Putting the Ss into competitive groups showed that the achievement scores of women dropped off. Women with the lowest fear of success behaved more like men when competing.—*E. J. Posavac.*

3030. Jackson, Dorothy W. (Ohio State U.) Self as process: Implication of role behavior. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4314-4315.

3031. Koenig, Frederick. (Tulane U.) Definition of self in France and Sweden. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 257-258.—Definition of self profiles were obtained by giving the Twenty Statement Test responding to the phrase "I am—?" to 80 Swedish and 96 French university students. The average percentage of unusual responses was computed for both groups. The Swedish students showed greater social independence in their responses compared to the French, by having fewer consensual responses. Both had fewer consensual re-

sponses than United States students had in a previous study.—*Author abstract.*

3032. Levine, Frederic J. (U. Michigan) A reply to Wolitzky's "Note on 'Color-Word Test performance and drive regulation in three vocational groups.'" *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 294-295.—Argues that the theoretical objections proposed by D. L. Wolitzky (see PA, Vol. 46:Issue 2) to the premises of a study by F. J. Levine (see PA, Vol. 43:4002) are based on some misunderstandings of the study's rationale, and to a difference in definition of the concept of constricted vs. flexible control. It is suggested that this difference reflects a serious lack of clarity in the field, and that the study tested an important, widely held interpretation of the control concept. Wolitzky's statistical comments are seen as a valuable caution in interpreting the study, but as not significantly weakening its conclusions.—*Journal abstract.*

3033. Looft, William R. & Baranowski, Marc D. (U. Wisconsin) Birth order, sex, and complexity-simplicity: An attempt at replication. *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 303-306.—Birth order, sex, and preference-for-complexity data were obtained from 119 undergraduates in order to test 4 hypotheses derived from the findings of several studies reported by Eisenman. Only 1 of these hypotheses concerning birth order and sex differences for complexity preference was statistically supported, though other differences were in the hypothesized directions. Mean complexity scores and correlations of the complexity measure with sex and birth order were widely discrepant with those reported in earlier studies by Eisenman. The presence of marked differences between the present population and those sampled by Eisenman may account for the discrepancies.—*Journal abstract.*

3034. MacDonald, A. P. (West Virginia U.) Birth order and personality. *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 171-176.—Investigated 6 personality variables for birth order differences in 339 male and 447 female and 210 male and 266 female undergraduates. Ss in the former were studied for dogmatism, ambiguity tolerance, and rigidity. Measures of (a) internal-external locus of control, and (b) social responsibility were administered to the latter. Both samples were given the Marlowe-Crowne Social Desirability Scale. Data were analyzed in 2 x 3 factorial analysis of variance design: 2 levels of sex and 3 levels of birth order (only child, 1st born, and later born). It was found that (a) later borns from 2-child families were more external than those from larger families; (b) later borns from 2-child families were more external than only children or 1st borns from 2-child families; (c) only children and 1st borns were more socially responsible than later borns; (d) 1st borns were more rigid than only-child and later-born Ss; and (e) only-female Ss manifested higher need for approval than only males. (26 ref.)—*Journal abstract.*

3035. Marshall, Nancy J. (U. California, Berkeley) Orientations toward privacy: Environmental and personality components. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4315-4316.

3036. Mealiea, Wallace L. & Farley, Frank H. (U. Wisconsin) Birth order and expressed fear. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 239-240.—148 female college students were given the Wolpe Fear

Survey Schedule and divided into 6 groups on the basis of birth order and family size. General fear scores and extreme fear scores were computed for each S. No significant differences were found among the groups on general fear. However, analyses of extreme fear indicated that 1st-born Ss expressed a significantly greater proportion of extreme fears, especially those of an interpersonal nature, than did later-born Ss. The results were related to previous birth-order findings.—*Author abstract*

3037. Mikesell, Richard H. & Tesser, Abraham. (U. Georgia, Inst. for Behavioral Research) **Life history antecedents of authoritarianism: A quasi-longitudinal approach.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 369-370.—719 male college freshmen completed an objectively scorable Biographical Information Blank and a measure of their current authoritarian attitudes. The Biographical Information Blank was factor analyzed and the resulting factor scores were correlated with Jackson and Messick's F scale. A multiple regression coefficient using F scale as a criterion was obtained. Bio-data factors of idealized parental relations, athletic activity and interest, ideological intellectual independence, religious activity, and anomie correlated significantly with F score. The multiple correlation was .44. The extent to which these empirical relationships mirror previously hypothesized theoretical relationships is discussed.—*Author abstract*

3038. Ryckman, Richard M. & Rodda, William C. (U. Maine) **Locus of control and initial task experience as determinants of confidence changes in a chance situation.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 116-119.—Studied the effects of differences in locus of control and initial task experience on confidence rating changes under chance conditions using a $2 \times 2 \times 15$ factorial repeated-measures design. 40 internal and 40 external undergraduates were required to solve 15 line-matching problems after experiencing success or failure on 5 practice problems. Results indicated that Ss who experienced initial success were more confident over the last series of problems than Ss who experienced initial failure. Externals made more typical confidence shifts than internals following success, but contrary to expectation, internals made more shifts than externals after failure. Interpretations of this outcome include a hypothesized need by externals to defend against failure by refusing to change their confidence ratings.—*Journal abstract*

3039. Ryckman, Richard M., Stone, William F., & Elam, R. Richard. (U. Maine) **Emotional arousal as a function of perceived locus of control and task requirements.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 185-191.—Studied the effects of differences in sex, locus of control, and task requirements on emotional arousal in 78 Ss using a $2 \times 2 \times 2$ factorial design. Results indicate a general reluctance by male Ss to display emotion after E criticism of performance on a dart throwing task under nearly all of the experimental conditions. Female Ss, by contrast, behaved as expected, with externals reacting more strongly to criticism under chance conditions and internals reacting more strongly under skill conditions. Suggestions are made for a more direct test of the generality of R. B. Rotter and R. C. Mully's recent contention that internals and externals differ in the degree to which they value rewards obtained

under chance and skill conditions.—*Author abstract*

3040. Sheehan, Peter W. (U. New England, Armidale, New South Wales, Australia) **Measurement of a construct of the student-activist personality.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 297.—Obtained a definition of the activist personality from 8 judges. 32 items were selected from an initial pool to measure (a) ideological commitment, (b) rejection of authority, (c) replacement of authority, (d) conflict between real and ideal self, (e) self-punitiveness, and (f) need for self-actualization. The scale was administered individually to 41 male undergraduates and in group sessions to 84 male undergraduates. Results show a factor pattern corresponding to the ideology, authority, and conflict between real and ideal self constructs. Item content also suggested a self-punishment need. Validation tests were positive. It is suggested that the construct may be of value in studies "of the psychological attributes of subgroups of the student population."—S. Knapp

3043. Stefic, Edward C. & Lorr, Maurice. (Catholic U. of America) **Analysis of defensiveness in relation to psychopathology.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 205-209. Attempted (a) to determine what factors account for relationships among items representative of 5 well-known measures of defensiveness, and (b) to relate the factors found to homogeneous measures of psychopathology and extroversion-introversion. A 246-item inventory was administered to 217 undergraduate and graduate students. An initial analysis of the 110 defensive items yielded 8 factors of which the 1st, admission of common frailties, was defined by items from the Lie, the Good Impression, the Marlowe-Crowne, the K, and the Cofer malinger scales. Items best defining 6 of the defensive factors, 6 psychopathology factors, and an extroversion scale were grouped into homogeneous subsets. The 2 main factors yielded by the factor analysis of the subset correlations were interpreted as dimensions of extra- and intro-punitiveness. (18 ref.)—*Journal abstract*

Behavior Correlates

3044. Ack, Marvin. (Menninger Foundation, Div. of School Mental Health, Topeka, Kan.) **Toward understanding irrationality.** *Menninger Quarterly*, 1969(Sum), Vol. 23(2), 2-13. —Discusses irrationality as the results of unconscious drives and processes. "Although the form of expression of drives is determined by other agencies of the mind, 1 of the major characteristics of the unconscious is that it does harbor these forces, that they are powerful, and they constantly search for expression. Only such a postulation makes reasonable the behavior we see around us." Illustrative examples are included.—S. Knapp

3049. Carr, Gordon D. (Veterans Administration Outpatient Clinic, Boston, Mass.) **Introversion-extraversion and vigilance performance.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 379-380.—80 Ss (40 introverts and 40 extroverts) performed an auditory vigilance task including pre- and posttests with knowledge of results. The extroverts displayed significantly more vigilance decrement during the watch and significantly greater increases in correct detections and commission errors in the posttest. The results support Eysenck's hypothesis that extroverts will show more performance decrement on vigilance tasks because of a greater accumulation of reactive inhibition over the course of a watch. The advent of the posttest appeared to function as a disinhibitor, allowing the extroverts to resume their initial level of responding.—*Author abstract.*

3050. Clark, Lynn F. & Neuringer, Charles. (Western Kentucky U.) **Repressor-sensitizer personality styles and associated levels of verbal ability, social intelligence, sex knowledge, and quantitative ability.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 183-188.—Utilized Byrne's Repression-Sensitization scale to assign 164 male undergraduates to repressor, neutral, or sensitizer groups. Scores from measures of verbal ability, social intelligence, sex knowledge, quantitative ability, and scholastic grades were obtained. Sensitizers, who use such defenses as intellectualization, rumination, and approach, were hypothesized to score higher on selected intellectual measures than repressors who use repression, denial, and avoidance. Results were opposite to those hypothesized, with repressors significantly exceeding sensitizers on 6 of 12 measures, using *t* tests. Sensitizers did not significantly exceed repressors on any of the measures. When verbal aptitude was held constant through covariance, the groups did not differ. It is concluded that repressors exceed sensitizers on verbal aptitude and that other obtained differences are artifacts of this variable.—*Journal abstract.*

3051. Entin, Elliot E. (Ohio U.) **The effect of achievement-oriented tendencies and extrinsic tendencies on performance.** *Proceedings of the Annual*

Convention of the American Psychological Association, 1971, Vol. 6(Pt. 1), 383-384.—Investigated the hypothesis that the addition of a positive tendency extrinsic to the achievement-oriented tendency causes a decrement in high achievement-oriented Ss. Ss high in the achievement-oriented tendency working under a private (achievement-oriented) condition performed better than Ss low in the achievement-oriented tendency. This was not true for the high achievement-oriented Ss working under the public (multiincentive) condition. Furthermore, high achievement-oriented public Ss performed significantly poorer than high achievement-oriented private Ss. The results were in accord with earlier studies and supported the contention that high levels of positive motivation can be counterproductive.—*Author abstract.*

3052. Gotts, Linda L. (U. Texas) **The effects of depressive tendencies upon accuracy, criterion, and latency measures of recognition memory for social stimuli.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4336-4337.

3053. Harris, Beatrice. (New York U.) **Personality factors and information demand in decision making: The influence of category width, the need to achieve, fear of failure, utility of reward, and payoff on information demand on an expanded judgment task.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4312-4313.

3054. Hershkowitz, Murray L. (U. Texas) **Recognition memory for hostile and friendly stimuli as a function of neuroticism, Introversion-extraversion and arousal: A signal detection approach.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4338-4339.

3055. Kahn, Malcolm & Schill, Thomas. (U. Miami) **Anxiety report in defensive and nondefensive repressors.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 300.—Selected groups of 24 undergraduate sensitizers, defensive repressors, and nondefensive repressors from scores on a questionnaire combining the Byrne Repression-Sensitization scale and the Marlow-Crowne Social Desirability Scale. Each S then took the Institute for Personality and Ability Testing Anxiety Scale. Nondefensive repressors scored significantly higher than defensive repressors. Results confirm "previous findings that repressors are not homogeneous in their reactions to threat and that defensiveness" may be used to identify the 2 subgroups.—*S. Knapp.*

3056. Lester, Gene & Lester, David. (State University Coll. New York, Buffalo) **The fear of death, the fear of dying, and threshold differences for death words and neutral words.** *Omega*, 1970, Vol. 1(3), 175-179.—25 Ss were tested for differences in recognition thresholds for death-related and neutral words, and were given a fear of death test. Significantly lower thresholds were found for death-related words. Ss with a higher fear of death tended to have relatively low thresholds for words related to the active process of dying, and relatively high thresholds for words related to the state of being dead. The reverse was true for Ss with low fear of death.—*Author abstract.*

3057. Looft, William R. (U. Wisconsin) **Conservatives, liberals, radicals, and sensation-seekers.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 98.—119 university students made self-ratings on a 5-point conservative-liberal political continuum and also completed 3 questionnaires which purport to measure the

need for "sensation-seeking" or stimulus variation. The correlations between the questionnaires and the self-ratings were significant and indicated that high sensation-seekers tend to perceive themselves as possessing a liberal-left political orientation.—*Author abstract.*

3058. Nowicki, Stephen. (Emory U.) **Ordinal position, approval motivation, and interpersonal attraction.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 265-267.—Attempted to incorporate ordinal position effects within approval-dependency theory. 257 undergraduates completed the Marlowe-Crowne Social Desirability Scale (SDS) and birth-order data prior to the actual experiment. Bogus SDSs were completed by the E to correspond to the same score level of the individual Ss but with either 75 or 50% item agreement. The 3×2 analyses of variance for SDS scores and expressed attraction indicate that 1st- and middle-born females had higher SDS scores and expressed more attraction. A separate analysis indicates that although only-born females had similar SDS scores, they expressed significantly more attraction. Correlations between SDS scores and expressed attraction were significant. Results are interpreted as being congruent with approval-dependency theory.—*Journal abstract.*

3059. Spellman, Charles M., Baskett, Glen D., & Byrne, Donn. (Woods County Guidance Clinic, Alva, Okla.) **Manifest anxiety as a contributing factor in religious conversion.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 245-247.—Investigated the relationship between manifest anxiety and religious conversion. 3 groups of 20 residents in a predominantly Protestant town were identified by the community's 2 ministers: (a) Ss having had a sudden religious conversion experience, (b) Ss having had a more gradual religious development, and (c) Ss who were not religious at all. The MA scale was administered to the members of each group. Group b and Group c did not differ significantly from each other on manifest anxiety, but Group a obtained significantly higher scores on the MA scale than the other 2 groups combined.—*Journal abstract.*

3060. White, Barbara O. & Kernaeguen, Anne P. (Utah State U.) **Comparison of selected perceptual and personality variables among college women deviant and non-deviant in their appearance.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 87-92. —40 college women, 20 designated as deviant and 20 as nondeviant on the basis of skirt length, were administered measures of field-dependence, psychological security-insecurity, inner-other directedness, and orientations to dress. The hypothesized difference between deviant and nondeviant Ss on selected variables of perception and personality was largely confirmed. Deviant Ss were significantly more field-independent, psychologically more secure, and had a stronger orientation to dress to seek rewards and to be different from others than nondeviant Ss. The latter were more field-dependent, more insecure, and had a greater orientation to dress to avoid punishment and to be like others. Deviants and nondeviants were not significantly different in inner-other directedness; both groups scored within the other-directed range.—*Journal abstract.*

3061. Williams, James G. (George Peabody Coll. for Teachers) **Internal-external control as a situational variable in determining information-seeking by Negro students.** *Dissertation Abstracts International*, 1970-(Dec), Vol. 31(6-B), 3718-3719.

3062. Wolitzky, David L. (New York U.) **A note on "Color-Word Test performance and drive regulation in three vocational groups" by Levine.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 292-293.—Disputes the conclusion of F. J. Levine (see PA, Vol. 43:4002) that there was a lack of support for the concept of constricted vs. flexible cognitive control measured by the Color Word Task. It is suggested that this conclusion is misleading in view of issues concerning the logic of the derived predictions and the statistical power of the study.—*Journal abstract.*

INTELLIGENCE

3063. Bodmer, Walter F. & Cavalli-Sforza, Luigi L. (U. Oxford, England) **Intelligence and race.** *Scientific American*, 1970(Oct), Vol. 223(4), 19-29.—From a review of research assessing environmental and genetic determinants of intelligence, it is concluded that (a) the question of whether reported racial differences in IQ scores have a genetic basis cannot be adequately answered on the basis of available data, and (b) there are no theoretical or practical reasons for encouraging the support of such research.—*P. Tolin.*

3064. Cooper, Gertrude V. (American U.) **Effects of anxiety and color among male and female subjects on the Block Design subtest of the Wechsler Adult Intelligence Scale.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3701.

3065. Elithorn, Alick & Telford, Alex. (Inst. of Neurology, Medical Research Council, London, England) **Game and problem structure in relation to the study of human and artificial intelligence.** *Nature*, 1970(Sep), Vol. 227(5264), 1205-1210.—Attempts to define those parameters of a limited subset of games—fully 'rational' board games, which determine the characteristics and the complexity of the skills involved and hence the possible roles of different games in psychological research." Hierarchical problem sets, interaction complexity, and puzzles and games, are defined, illustrated, and discussed (19 ref.)—*S. Appelle.*

3066. Fischbach, Thomas J. & Walberg, Herbert J. (U. Wisconsin, R & D Center for Cognitive Learning) **Weighted and unweighted means for estimation: A note on the Humphreys-Dachler and Jensen papers.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 79-80. Demonstrates that the methods used by L. G. Humphreys and P. Dachler (see PA, Vol. 44:3467) to estimate effects in their analysis of Project TALENT data to test A. R. Jensen's theory of intelligence produced biased estimates. A statistical model appropriate for the problem and Humphreys and Dachler's definitions of parameters are presented and alternative estimators which are unbiased and have other desirable statistical properties are proposed.—*Journal abstract.*

3067. Garnis, Joe D. (Children's Medical Center, Tulsa, Okla.) **Factor analysis of the WISC and ITPA.** *Psychology*, 1970(Nov), Vol. 7(4), 30-31.—Subscales from the WISC and the revised Illinois Test of Psycholinguistic Abilities (ITPA) were factored by a principal components solution with a varimax rotation of the factor matrix resulting in 2 factors: verbal organizational and integrative ability, and nonverbal organization and integrative ability. This study suggests that the WISC and ITPA measure somewhat the same dimensions.—*J. A. Blazer.*

(McGill U., Montreal, Quebec, Canada) **Correlations between performance on the Category Test and the Wechsler Adult Intelligence Scale.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 70.—29 16–35 yr. old Ss were administered the Category Test (CT) and the WAIS. Product-moment correlations were significant for 102 of the 108 comparisons between CT subsets and WAIS subtests and factors. The WAIS Full Scale Total appeared to be the best predictor of CT performance.—*Author abstract.*

CREATIVITY

3069. Baker, Marjorie A. (Washington U.) **The relationship of creativity to several selected personality variables.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4324.

3070. Domino, George. (Fordham U.) **Cinematographic creativity and personality.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 413–414.—Cinematography has long been recognized as a form of creative endeavor, but only recently has it become a medium of expression available to the individual artist; such recency is reflected by the absence of relevant psychological studies. Personality profiles of a group of cinematographers participating in a regional film exhibition were compared with those of a control group. Cinematographers were more active and insightful, possessive of greater self-confidence, more psychologically minded, and characterized by greater flexibility and femininity of interests. Substantial similarities with personality characteristics of creative architects were observed.—*Author abstract.*

3071. Fruin, David J. (Johns Hopkins U.) **Response styles and creativity.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4361.

3072. Grossman, Jan C. & Eisenman, Russell. (Temple U.) **Experimental manipulation of authoritarianism and its effect on creativity.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 238–244.—Examined the hypothesis that authoritarianism and creativity may be opposite poles of the same continuum. 500 undergraduates were administered the California F Scale and the Personal Opinion Survey measure of creativity. A total of 80 Ss were chosen to fit 4 groups: males high in authoritarianism and low in creativity, females high in authoritarianism and low in creativity, males high in creativity and low in authoritarianism, and females high in creativity and low in authoritarianism. A modified Asch-type conformity situation was used to see if changing authoritarianism would affect creativity scores. All 4 groups had their authoritarianism manipulated in the predicted direction, and this resulted in changed creativity scores for all groups except the high-authoritarian males. Results support the hypothesis. (24 ref.)—*Journal abstract.*

3073. Helson, Ravenna. (U. California, Berkeley) **Women mathematicians and the creative personality.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 210–220.—Compared 16 creative women mathematicians with 28 other women PhDs in mathematics. The 2 groups differed slightly, if at all, on measures of intelligence, cognition, and masculine traits, but creative Ss had a stronger cathexis of research activity and were highly flexible, original, and rejecting of outside influence. Personality inventories, observa-

tions of the assessment staff, and self-descriptions of research style gave consistent results. $\frac{1}{2}$ the creatives were foreign born, and most had professional men as fathers. Interviewers judged that they had identified primarily with their fathers, and that their interest in mathematics had arisen from sublimation or search for autonomy in fantasy rather than from reaction formation or withdrawal. As compared with creative male mathematicians, the creative women had less assurance, published less, and, if they had a job at all, occupied less prestigious positions. (33 ref.)—*Journal abstract.*

3074. Jawa, Sarala. (Baroda U., India) **Creativity and orientation type.** *Psychology Annual*, 1970(Mar), Vol. 4, 45–48.—Hypothesized that creative individuals are more task- than interaction-oriented. 61 undergraduates completed the Pre-Conscious Activity Scale and the Orientation Inventory. Results confirm the hypothesis. Highly creative Ss were more task-oriented, less self-oriented, and even less interaction-oriented. (21 ref.)—S. Knapp.

3075. Keillor, James S. (Wayne State U.) **The effects of experimentally induced consciousness expansion and consciousness control upon creativity and intellectual functioning.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4339.

3076. Kilborn, Susan K. (Michigan State U., Coll. of Human Ecology) **Perception and creativity in clothing.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 24–26.—152 college women were administered perception and creativity measures developed to test relationships between aspects of such performance in areas of clothing. The hypothesized relationships between extent and type of verbalized perception in clothing and level of judged success on selected factors of creativity for a design exercise in clothing were not confirmed. The data gave no insight into possible relationships between the 2 behaviors.—*Journal abstract.*

3078. Schaefer, Charles E. (Children's Village, Dobbs Ferry, N.Y.) **Imaginative elements in the thematic fantasies of creative young women.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 417–418.—Thematic protocols of highly creative girls were rated by clinical psychologists as exhibiting more vivid imaginative elements than the protocols of matched controls. In particular, the protocols of the creative girls were found to contain a significantly greater proportion of the following figurative and animated elements: metaphor, symbolism, animism, and dialogue. Results indicate that a vivid imagination is a definable thought process that has specific measurable characteristics.—*Author abstract.*

3079. Torrance, E. Paul. (U. Georgia) **Stimulation, enjoyment, and originality in dyadic creativity.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 45–48.—Hypothesized that Ss taking a test of creative thinking in dyads would attain a higher level of originality and experience stronger feelings of stimulation, enjoyment, and originality of expression than Ss working alone under standard test conditions. 74 female and 26 male undergraduates were assigned randomly to the experimental and control conditions. In the experimental condition Ss were instructed to sit together and to call out their responses as they wrote them, to

hitchhike on one another's responses, but not to repeat one another's responses. The Ask-and-Guess Test of the Torrance Tests of Creative Thinking (Form A) was used as a warm-up task and the Product Improvement Test of this same battery was the test task. A set of 10-point rating scales was used to obtain self-ratings of feelings of stimulation, enjoyment, and originality of expression. Findings support all 4 of the hypotheses.—*Journal abstract.*

PERSONALITY MEASUREMENT

3080. Coe, William C. & Sarbin, Theodore R. (Fresno State Coll.) **An alternative interpretation to the multiple composition of hypnotic scales: A single role-relevant skill.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 1-8.—Reexamines factor-analytic studies of hypnotic scales and concludes that item clusters represent similar levels of item difficulty, rather than underlying traits or mechanisms. A continuous ability, a role skill, is postulated to account for the variable difficulty of items in hypnotic scales. 2 parameters are suggested to account for the difficulty variable: the increasing dependence on a cognitive process (imagining) and the decreasing believability of the S's response. The cognitive process is identified as a skill in taking a hypothetical attitude and the ability to concentrate or become involved in a role. It is postulated that this role skill accounts for the behaviors usually attributed to "real" hypnosis, "hypnotic trance," or "hypnotic state." (22 ref.)—*Journal abstract.*

3081. Conde Lopez, V., Escibá P., J. A., & Izquierdo T., J. A. (Faculty of Medicine, Salamanca, Spain) **Evaluación estadística y adaptación castellana de la escala autoaplicada para la depresión de Zung.** [Statistical evaluation and Spanish adaptation of the Zung Self-Rating Depression Scale.] *Archivos de Neurobiología*, 1970(Jul), Vol. 33(3), 281-302.—Administered the Self-Rating Depression Scale (SDS) to 600 male and female Ss divided by age and sex into groups of 50. Results show that the SDS index increases systematically with age, is higher in females, is very definitely influenced by social status, and is higher in rural areas. Other sociocultural factors, including marital status, are analyzed with respect to their effect on adapted SDS results in Spain. (English, French, & German summaries)—*T. N. Webster.*

3082. Cone, John D. (West Virginia U.) **Social desirability scale values and ease of responding to personality statements.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 119-120.—It was predicted and found that it is easier for Ss ($N = 160$) to give socially desirable (SD) than socially undesirable (SUD) responses to personality statements ($p < .001$). Moreover, high SD Ss ($N = 80$) reported significantly greater ease of responding than low SD Ss ($N = 80$), regardless of whether they had just made an SD or SUD response ($p < .001$). However, ease of both SD and SUD responding varied with the social desirability scale value of the item, but in opposite directions. Thus, omitting offensive items from a scale may improve certain of its psychometric properties while, paradoxically, increasing its offensiveness.—*Author abstract.*

3083. Fisch, Rudolf & Schmalt, Heinz-Dieter. (Ruhr U. of Bochum, Inst. of Psychology, W. Germany) **Vergleich von TAT- und Fragebogendaten der Leist-**

ungsmotivation. [Comparison of TAT and questionnaire data on achievement motives.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(4), 608-634.—Used 3 questionnaires in this study: the Test Anxiety Questionnaire (TAQ), Achievement Anxiety Test (AAT) both translated into German, and Ehler's Achievement Motivation Questionnaire (LM). Questionnaire and TAT data from 105 students were factor analyzed. Contrary to expectations only weak or no correlations were found between TAT and AAT, TAQ, and LM. An attempt is made to explain the results by analyzing the psychological dimensions that each of the test instruments seizes. (English & French summaries) (32 ref.)—*W. J. Koppitz.*

3084. Georgas, James G., Vassiliou, Vasso, & Kutakis, Harris. (Athenian Inst. of Anthropos, Athens, Greece) **The verbal intelligence of Athenians.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 165-173.—Studied the verbal intelligence of Athenians through the Information, Comprehension, and Similarities subtests of the WAIS. The 3 scales were given to 400 Athenians, 18 yr. and above, representative in terms of sex, age, education, and socioeconomic status. Mean scores of males were higher than females on the 3 subtests. Females correlated higher than males with education. Older Ss correlated lower than younger Ss with education. Retest reliability, internal consistency, and average scores in relation to age were consistent between the 2 cultures. The effects of sex role, literacy level, and other cultural variables on verbal intelligence are discussed. The overall findings suggest that verbal intelligence, as measured by these subtests, is valid across these 2 cultures.—*Journal summary.*

3085. Jaffe, Joseph & Brodie, H. Keith. (Columbia U.) **The narcissometer: An apparatus for quantification of "self-preoccupation."** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 9-10.—A task requires a visual fixation point incompatible with that for S's mirror image of his own face. Time on target, recorded as optokinetic nystagmus, is proposed as a distraction index.—*Journal abstract.*

3086. Jernigan, Larry R. & Demaree, Robert G. (Southern Methodist U.) **An item factor analysis of the Guilford-Zimmerman Temperament Survey.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1) 111-112.—Reports the results of an item factor analysis of responses to the Guilford-Zimmerman Temperament Survey (GZTS) provided by an industrial sample of 4186 Ss. Following the extraction of 20 factors from the matrix of phi coefficients for this data, 3 separate sets of varimax and promax rotations were performed. Identifications and interpretations of varimax factors obtained in a 10- and a 13-factor solution are offered. Results indicate that at least 10 fairly distinct factors underlie the GZTS; 13 relatively well-defined and content homogeneous factors were obtained in the 13-factor solution. The factorial validity of the 10 GZTS traits was not confirmed in either the 10- or 13-factor solution.—*Author abstract.*

3087. Lessing, Elise F. & Harrod, Alan R. (U. Illinois, Chicago) **Comparative predictive validity of the IPAT Jr.-Sr. High School Personality Questionnaire for white and black subsamples.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1) 245-246.—Question has been raised as to the applicability of personality tests to minority groups since these groups have rarely been

adequately represented in standardization samples. This study compared the predictive validity of the Institute for Personality and Ability Testing Jr.-Sr. High School Personality Questionnaire (HSPQ) in subsamples of 154 white and 56 Negro girls. The HSPQ Neuroticism score correctly identified 90% of the well-adjusted girls (white and Negro), but only 33% of the maladjusted white and 22% of the maladjusted Negro girls. Results of a regression analysis indicated that when appropriate new weights were used, the HSPQ had higher predictive validity for Negroes than for whites.—*Author abstract.*

3088. Love, Henry G. & Ashcroft, Lindsay M. (Porirua Hosp., New Zealand) **Errors in the A.C.E.R. scoring stencils for the M.M.P.I. Group Form.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 193-195.—Points out discrepancies between items punched on the Australian Council for Educational Research scoring stencils at the Porirua Hospital and MMPI handbook scale items. Pd and Pt scale values are found to distort the K scales which in turn, affect 5 clinical scales. When converting raw scores to T scores, T score values vary from 1-3 units, while K score errors range from -2 to +3. Table IV of the MMPI Handbook shows 4 of both 14 and 16 to be 6, while .5 of 14 and 17 are 7 and 9. "Errors in the size of 3-4 may make some difference in interpretation at the T-score range 65-75, and errors of 8-12 will almost certainly distort interpretations."—B. A. Stanton.

3089. Orvik, James M. (U. Colorado) **Social desirability for the individual, his group, and society.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3041-3042.

3090. Schmidt, Harald E. (National Inst. for Personnel Research, Johannesburg, South Africa) **Use of the "Famous Sayings" test in South Africa.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 135-141.—The Famous Sayings test consists of 4 measures: Conventional Mores, Hostility, Fear of Failure, and Social Acquiescence. The test was applied to 2 samples of South African students, 338 College of Education students whose data were analyzed according to sex, education, and age; and a nearly all male group of 110 1st-yr students of the Department of Architecture, whose data were combined for analysis. The mean scores for each total group on 2 of the 4 scales, Conventional Mores and Social Acquiescence, were considerably higher for the college group. The correlations among 4 scales for the 2 groups were similar and significant ($p \leq .01$). The item-analyses (internal consistency) performed for both groups show similar reliability coefficients for Conventional Mores and Social Acquiescence, but lower reliability for the College of Education group on Fear of Failure and Hostility. On the whole, the measures are sufficiently reliable and independent for screening purposes.—*Journal abstract.*

3091. Stanton, H. E. (Flinders U., Tasmania, South Australia) **An Australian validation study of the Taylor Manifest Anxiety scale.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 182-186.—Administered a modified MA scale to a group of Australian Ss and computed the coefficient from the proportion of Ss answering "true" in the highest 50 scorers and lowest 50 scorers. Results indicate that 4 items from the 50-item scale do not differentiate the 2 groups, and 7 more items differentiate minimally. The remaining 39 items are suggested to provide a valid measure of manifest anxiety for Australian students. Results generally confirm a number of previous investigations of the validity of the

MA scale conducted on American populations, and to support previous contentions that a shortened version of the MA scale may, if items are chosen carefully, be as valid a measure as the longer scale.—R. Wiltz.

3092. Strahan, Robert. (U. Rochester) **Subject satisfaction with questionnaire assessment a function of response format.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 125-126.—Compared S satisfaction with a personality questionnaire under true-false and graded response format conditions. When 40 male undergraduates were exposed to both conditions, they expressed a clear preference for the graded format questionnaire. When only 1 condition was experienced, format differences in S satisfaction were nonsignificant. It is suggested that in this latter situation format differences might still be present, but masked by large individual differences in absolute rating behavior. One attempt at partial reduction of idiosyncratic rating did not result in significant format differences.—*Author abstract.*

3093. Tringer, László. **A Brengelmann-féle személyiségvizsgáló kérdőív magyar változata.** [A Hungarian version of the Brengelmann Personality Inventory.] *Magyar Pszichológiai Szemle*, 1969, Vol. 26(3 4), 477-491.—An adaptation of the German version of the MPI was standardized and validated on a Hungarian sample. Inventories

3095. Smith, Roger C. (FAA, Civil Aeromedical Inst., Oklahoma City, Okla.) **Affect adjective check lists and the assessment of psychological effects of stress: A study of response bias.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 123-124.—Developed an index to identify simulation of stress in responses to affect adjective checklists. An 80-item composite of 3 adjective checklists was administered twice to each of 154 paid student volunteers. The 1st administration was with standard directions, while instructions for the 2nd administration requested either maximal or subtle exaggeration of stress. A 6-item index was found which yielded 78-95% correct identifications of simulated profiles for 5 and 12% false-positive error rates, respectively. The index was, as expected, more effective in identifying maximal exaggeration of stress than subtle response distortion.—*Author abstract.*

Projective Techniques

3096. Lavit, Ronald J. (Maricopa County Health Dept., Phoenix, Ariz.) **Variables underlying the perception of inkblots by high test anxious students.** *Psychology*, 1970(Nov), Vol. 7(4), 58-60.—From a group of 374 college students, 40 high anxious Ss were selected from the upper 15th percentile of a distribution of Test Anxiety Questionnaire scores. The variables which emerged in the analysis of high test anxious Ss were (a) reality oriented cognitive process, (b) avoidance of emotional reactivity and denial of inner needs, (c) denial

of fantasy processes, and (d) denial or repression of anxious and hostile feelings.—*J. A. Blazer.*

3097. Lavit, Ronald J. & Garms, Joe D. (Maricopa County Health Dept., Phoenix, Ariz.) **Factors in the perception of inkblots for male college students.** *Psychology*, 1970(Nov), Vol. 7(4), 48-50.—The Holtzman Inkblot Technique was administered to 28 male college students. 7 factors emerged reflecting: (a) mature perceptual integration differentiation, (b) emotional reactivity (hostility and anxiety), (c) awareness and sensitivity to inner needs and outer reality, and (d) emotional immaturity characterized by a bodily preoccupation and sexual fantasy.—*J. A. Blazer.*

3098. Lavit, Ronald J. & Garms, Joe D. (Maricopa County Health Dept., Phoenix, Ariz.) **Factors in inkblot perception of college students.** *Psychology*, 1970(Nov), Vol. 7(4), 27-29.—The Holtzman Inkblot Technique was administered in groups to 80 Ss (28 male, 52 female), chosen from a group of 374 summer school students. 7 factors emerged reflecting: (a) mature integrative and ideational capacity; (b) objective, stereotyped cognitive processes; (c) preoccupation with body parts and sexual concerns; (d) sensitivity to inner feelings and needs; and (e) avoidance of anxiety-producing reality and emotional conflicts.—*J. A. Blazer.*

3099. Lavit, Ronald J. & Garms, Joe D. (Maricopa County Health Dept., Phoenix, Ariz.) **Factors in the perception of inkblots for female college students.** *Psychology*, 1970(Nov), Vol. 7(4), 38-40.—The Holtzman Inkblot Technique was administered to 52 female college students. 6 factors emerged reflecting: (a) capacity for mature interpersonal relationships, (b) emotional reactivity, (c) free-floating anxiety, (d) controlled hostility, and (e) preoccupation with sexual and somatic themes.—*J. A. Blazer.*

Rorschach Test

3100. Bolzinger, A. & Durand de Bousingen, R. (Strasbourg U., Psychiatric Clinic, France) **Constitution et structure dans l'histoire du test Rorschach.** [The history of the formation and structure of the Rorschach test.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(11-12), 621-627.—Presents a history of the development of the Rorschach test, and discusses diagnostic theory particularly emphasizing Minkowska's typology. (33 ref.)—*R. E. Smith.*

3101. Bottenberg, Ernst H. (U. Würzburg, Inst. of Psychology, W. Germany) **Exploration der Struktur des Rorschachtests (Ro 30).** [Exploration of the Rorschach test structure (Ro 30).] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(4), 553-591. Based on 414 protocols collected from male Ss, a psychometric version of the Rorschach test interpretation, Ro 30, was factor analyzed. Results yielded 4 dimensions called ego maturity, emotional psychophysiological activation, cognitive control of breaking established patterns of reality testing, and cognitive control of expression. The model of a multi-level decision process representing the Rorschach test performance is used in the explanation of the factor analytic results. (English & French summary) (133 ref.)—*W. J. Koppitz.*

3102. Craft, Robert B. (U. Tennessee) **The effects of inkblot meaning upon the approach-avoidance response characteristics of repressors and sensitizers.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4332.

3103. Schachter, M. (Comité de l'Enfance Déficiante, Marseille, France) **Contribution à l'étude des interprétations des espaces blancs (détails intermaculaires, Dbl.) dans le test de Rorschach et de leur signification.** [The interpretation of Rorschach white-space responses and their meaning.] *Annales Médico-Psychologiques*, 1970(Mar), Vol. 1(3), 329-351.—Focuses on the interpretation of responses made to white space and presents a review of the available literature and several kinds of data from the author's experience. Generally, an above-normal use of white space has been thought to reflect oppositional behavior. Some authors further suggest that their frequent use may also denote a mental flexibility, in the sense that an adaptation is being made to a transposition of objective sense data. Reported here is the white-space use made by 250 mentally subnormal children (selected for oppositional character disorder), by a group of 40 physicians (who must show a capacity for reinterpretation of the same sense data from many different points of view), by 40 patients with cranial trauma (held by some to show an increased mental fluidity), and by 30 suicidal adults (who may be said to be in severe opposition to themselves, their environment, or both). A clinical description is also included of a single case who produced an unusually large number of white-space responses. Contrary to the views of H. Rorschach and others, these data show that white-space use is not a rarity among normal Ss. It does not characterize "oppositional tendency," but rather typifies evasiveness and an inclination to dissimulate and cloak the real personality. White-space response must always be interpreted in terms of the global qualitative level of the protocol elicited.—*H. E. King.*

3104. Thakur, G. P. & Thakur, Manju. (Ministry of Railways R.D.S.O., Lucknow, India) **Symbolic meaning of Rorschach Cards II, IV and VII.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 190-104 undergraduate males of Bihar University were asked to study the 10 Rorschach picture cards and designate the cards which reminded them of father, mother, and brother/sister. The study did not support the hypothesis that Cards II, IV, and VII symbolically represent sibling, father, and mother, respectively. Verification with other procedures seems appropriate.—*Author abstract.*

3105. Wagner, Edwin E. & Hoover, Thomas O. (U. Akron) **Exhibitionistic M in drama majors: A validation.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 125-126.—8 student drama majors gave significantly more exhibitionistic M on the Rorschach than a matched control group. Results were construed as supporting Piotrowski's interpretation of the human movement response. Additional connotations of M are suggested.—*Journal abstract.*

3111. **Bhagat, M. & Fraser, W. I.** (Victoria Hosp., Kirkcaldy, Scotland) **The meaning of concepts to the retarded offender.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 260-267.—Administered the semantic differential, a technique for measuring meanings, to 81 mentally retarded Ss and 40 young offenders of average intelligence, and found it to be a feasible instrument with retardates. The retarded offenders' responses to concepts relevant to delinquency were similar to those of their intellectually-average counterparts, but there were significant differences. There was no evidence that the therapeutic milieu had engendered objectivity about self or surroundings.—*Journal abstract.*

3112. **Bonnaud, M.** **Enquête sur la santé mentale en Polynésie française.** [Inquiry into mental health in French Polynesia.] *Annales Médico-Psychologiques*, 1970(Mar), Vol. 1(3), 375-421.—Reports an epidemiologic study of the impact of urbanization and other recent social changes on psychological maladaptation among the French Polynesian island population. The incidence of behavior disorder can only be approximated, owing to geographic isolation and a tendency to keep the afflicted in the home as long as possible (and beyond the optimum for effective treatment). Social changes wrought by World War II and the subsequent development of air transport have modified markedly the work and economic life of the island people. Juvenile delinquency has increased, but the major mental disorders are found to resemble those known in European countries, and are in much the same proportions. Despite magical beliefs concerning the origin and treatment of mental disorder, long-established native terminology indicates a clear recognition of all the principal syndromes. Sociopathic behaviors (absenteeism, delinquency, alcoholism, socioaffective aggression) are the more specifically Polynesian problems, aggravated by massive population shifts to the principal island (Tahiti) and capital. The treatment of the behavior disorders brought about by accelerated social mutation will require social action on social problems, supported by improved psychiatric hospitals and the development of specialized psychiatric personnel.—*H. E. King.*

psychiatry: A seminar.] *Evolution Psychiatrique*, 1970(Jan), Vol. 35(1), 215-220.—Presents a description of an "ethno-psychiatric" seminar in Bordeaux, France with the participation of a group of psychiatrists and ethnologists. It is stressed that an "open-minded" collaboration between the 2 is not only necessary but could yield fruitful results, specifically in the comparative approach to common vocabulary. Such an approach would help in the unification of various concepts with an interdisciplinary mind. Formation of various groups consisting of psychiatrists and ethnologists is recommended. (English summary)—*I. Sirotnin.*

3115. **Burke, Edward L.** (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) **Patient values on an adolescent drug unit.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 400-410.—Reviews observations of a clinician in a drug therapy unit. Although none of the teen-aged patients would openly discuss a value system, the therapist inferred that such implicitly existed. Noninterference was the basic premise to this value system. It was seen as a direct reaction to the paternalism that each patient seemed to have experienced. All patients seemed to exhibit ambivalence about the pleasure, yet destructiveness of a situation. "Thou shalt not fink" was put forth as a 2nd moral tenet. These patients were observed to exhibit inhibitive rather than promiscuous sexual behavior. The patients' attitudes toward religion, jobs, money, private property, and the meaning of love were all assessed. Critical self-examination was not only a negative aspect of therapy; for some it was an impossibility. It is concluded that this inability for self-appraisal may be a crucial reason for turning to drug use.—*C. O'Donnell.*

3116. **Dalton, Katharina.** (University Coll. Hosp., London, England) **Children's hospital admissions and mother's menstruation.** *British Medical Journal*, 1970(Apr), Vol. 2(5700), 27-28.—Interviewed mothers of children admitted as emergencies to the children's ward (30 beds) of a general hospital in North London when they were visiting their children. Of 100 children's emergency admissions to hospital, 49% were admitted during the mother's paramenstruum. There was a statistically significant association between the mother's menstruation and the child's admission both for accidents and for illnesses. The eldest child in the family appeared to be most affected. *Journal abstract.*

3117. **DeWolfe, Alan S., Barrell, Robert P., Becker, Bruce C., & Spaner, Fred E.** (Veterans Administration Hosp., Downey, Ill.) **Intellectual deficit in chronic schizophrenia and brain damage.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 197-204.—Studied scores on the WAIS and the Halstead Battery of Neuropsychological Measures (HB) of 100 chronic schizophrenic and 100 brain-damaged patients divided into equal groups of younger (ages 26-59) and older (ages 60 and over) Ss. A significant interaction of WAIS scores with diagnosis and of HB scores with diagnosis and age was found. Pattern analysis indicate that the younger Ss in both groups differed in WAIS Comprehension and Digit Span and HB Category. Older Ss differed in WAIS Comprehension, Digit Span, Picture Completion, Block Design, and HB Speech Discrimination. Results suggest differing intellectual deficit patterns in chronic schizophrenia and brain damage. (16 ref.)—*Journal abstract.*

gyepedagógiai lélektan tudományelméleti kérdéseibe. [Introduction into the epistemologic questions of orthopsychology.] *Pszichológiai Tanulmányok*, 1967, No. 10, 635-640.

3119. Lesse, Stanley. (15 W. 81st St., New York, N.Y.) **The medicine machine versus today's super-specialist: A study in anachronization.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 377-379.—Presents an editorial plead for an efficient yet humanistic approach to the practice of "medical and paramedical" specialities. It is suggested that the pressures from population growth, great technological advances in machines adaptable for medical practice, and current trends in medical education have laid the framework for a "cybernated" type of medical practice. A schema for this type of medicine is elaborated. The medical academicians would be trained in comprehension and application of the interrelationship in human systems. The medical technical expert would function in a computer-based environment much as the contemporary physician. It is concluded that we now have a choice to attempt this highly mechanized system on a personal level.—C. O'Donnell.

3120. Lester, David. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **The concept of an appropriate death.** *Psychology*, 1970(Nov), Vol. 7(4), 61-66.—"An appropriate death... is defined as one which is consistent with the individual's life-style." 4 kinds of death are described, i.e., physical, psychological, social, and anthropological. It is suggested that from the viewpoint "of counselor, therapist, or doctor it is perhaps 1 of our responsibilities to ensure that a person dies an appropriate death. To do this we must first be aware of the alternative concepts and then we must seek the concept that the patient has. If death for him is more appropriate in one way, then perhaps it is our duty to allow him to die in that way.... For many of us, there may be times when it is impossible to act against our own values and beliefs, but even at these times, if we are aware of these issues, we can perhaps aid the patient therapeutically to adjust to the circumstances that we are going to impose upon him regardless of his values and beliefs."—S. Knapp.

3121. Mathieu, M., Thirion, D., Bosson, P., & Chouraqui, J. **Réflexions sur l'hygiène mentale des jeunes adultes a partir de la sélection psychiatrique dans l'armée.** [Reflections regarding the mental health of young men separated from the Army through psychiatric screening.] *Hygiène Mentale*, 1970(May), Vol. 59(2), 33-62. Approximately 15% of a total of 29,000 men called for preinduction examination during the last quarter of 1968 and the 1st quarter of 1969 were rejected for psychological reasons. The principal reasons for rejection were reduced mental capacity without psychopathological complications, closely followed by neurotic disorders associated with immaturity. Homosexuality and dependence on drugs accounted for less than 1% each. 12 case histories are presented to illustrate candidates who adjusted or did not adjust to military service. (26 ref.)—K. J. Hartman.

3122. McKee, James L. (U. Denver) **Intellectual and behavioral correlates of chronic exposure to toxic chemicals.** *Dissertation Abstracts International*, 1971-(Jan), Vol. 31(7-B), 4341.

3123. Mende, Werner. (Tübingen U., Neuropathic Clinic, W. Germany) **Forensisch-psychiatrische Fragen bei Sterilisation und Kastration.** [Forensic-

psychiatric problems of sterilization and castration.] *Nervenarzt*, 1969(Oct), Vol. 40(10), 463-466.—Discusses the advisability of sterilization and castration of diseased persons and sex criminals from the legal, medical, and psychological angles. New legislation concerning sterilization is pending in West Germany at this time. It is believed that such drastic interventions should only be permissible on a voluntary basis and in extreme cases. Neurologists agree on the medical indication of sterilization of women which is, in psychiatry and neurology, practically a prophylactic intervention in order to avoid pregnancy when life is endangered. More controversial is sterilization for reasons of hereditary genetics. Castration is an even more serious and controversial intervention, due to its organic and psychological implications. It has been considered for criminological indications, but its "curative" effects are doubtful. Surgical castration as a "therapeutic" method will surely lose its practical significance as other and more dependable types of treating the "oversexed" are found and improved. (15 ref.)—P. von Toal.

3124. Menninger, Karl. (Stone-Brandel Center, Chicago, Ill.) **Psychiatry in a changing society.** *Hospital & Community Psychiatry*, 1969(Feb), Vol. 20(2), 55-58.—The restatement of diagnoses is perhaps the greatest current change. It is suggested that psychiatric diagnosis should not mean attaching a label to the patient. What do we say about stealing, raping, killing, overpopulation, poverty, unemployment, and the uses of war? It is suggested that psychiatrists must have views and profess them and must make moral judgments. There is a beginning toward making common cause with the sociologists. The "sins" of elective ignorance, of vengeance, of exclusive tribalism, of sloth, of indolence, of greed and stinginess and of wastefulness are emphasized. To combat our problems, it is suggested that people speak out against self-destructive habits. "We can strive to teach the alternative: to replace labeling by understanding; selective ignorance by information; and cynicism, depression and tribalism by cultivated trust in mankind."—B. A. Burkard.

3125. Pisani, D., Ardizzone, E. C., & Nigro, A. (U. Messina, Italy) **Passatizzazione dell'EEG per "blocco" dell'ammiccamento e della zona afferenziale specifica della motricità.** [The past state of the EEG "block" of winking and of motility's specific afferential zone.] *Rivista di Neurobiologia*, 1969(Oct), Vol. 15(4), 719-724.—Studied particular conditions defined as "blocking" of winking and "blocking" of the specific afferential zone of motility in normal, neurotic, and epileptic adolescents. It has been found that by applying silicone on the palm of the hand of an epileptic, the EEG progresses from a present to a past state. The "past" index of the EEG through reflex action is considered useful in epileptic therapy. 1st winking was blocked and variations of the GSR were recorded, then winking was blocked simultaneously with the application of silicone on the palm, and variations were recorded of EEG and GSR. The value of the 2 blocking techniques was confirmed, along with the attitude of "living in the present" and "living in the past" in neurotics and epileptics. A contribution was made also to the understanding of the mechanism which preserves its conditions of cerebral balance. (English summary) *A M Farfaglia*.

3126. Robertson, G. G. & Baizerman, Michael. (Veterans Administration Hosp., Sheridan, Wyo.) **Psy-**

chiatric consultation on two Indian reservations. *Hospital & Community Psychiatry*, 1969(Jun), Vol. 20(6), 186.

3127. Semenov, S. F. (Moscow Research Inst. of Psychiatry, USSR) **Autoimunnye protsessy u lits s nervno-psikhicheskimi zabolevaniyami.** [Autoimmune processes in persons with neuropsychic diseases.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1971(Jan), Vol. 26(1), 78-81.—Presents and discusses the results of systematic research, undertaken in the author's clinic, on the autoimmune processes in neuropsychic diseases, particularly in the so-called endogenic psychoses running a progressive course in which exogenic factors do not appear to exert a direct influence. On the basis of findings derived from clinical and immunological research a hypothesis on the role of autoimmune processes in the pathogenesis of schizophrenia, epilepsy, and other neuropsychic diseases pursuing a progressive course is advanced. New data on the possible presence of antibodies against the brain in neonate and maternal blood are cited. It is suggested that autoimmune processes can take part in the development of embryopathies and postnatal organic affections of the brain. (English summary) (27 ref.)—*I. D. London.*

3128. Shepherd, Michael & Cooper, Brian. (U. London, Psychiatric Inst., England) **Epidemiologia y psiquiatria.** [Epidemiology and psychiatry.] *Archivos de Neurobiologia*, 1970(Jul), Vol. 33(3), 339-365.—The potential contribution of epidemiological concepts and techniques to the study of mental disorders has become increasingly apparent in the past 20 yr. In a comprehensive review, the historical development of this trend is sketched and major problems of method are outlined. Applications of the epidemiological approach to psychiatry are discussed under 7 headings, each illustrated by several examples: (a) etiological studies, (b) illness-expectancy studies, (c) completion of the clinical picture, (d) delineation of syndromes, (e) community diagnosis, (f) historical studies, and (g) studies of health services in action. Mention is also made of the future implications of psychiatric epidemiology. (French summary)—*English summary.*

3129. Stewart, Horace. (West Georgia Coll.) **Kindling of hope in the disadvantaged: A study of the Afro-American healer.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 96-100.—In an exploratory study of the healing activities of the Afro-American healer, 8 healers and 25 clients were interviewed to ascertain the healer's ability to restore the ailing to health. Evidence was gathered that indicated healers engaged in a wide range of activities common illnesses, more serious illnesses, emotional problems, advice and guidance, and removing magical spells. The study was limited in that over 1/2 of the healers would not allow an interview.—*Journal abstract.*

3130. Torda, Clara. (Mt. Sinai Medical School, New York, N.Y.) **Observations on an effective method to shorten the psychotherapy of LSD-users.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 499-508.—Observed that most current methods of therapy for LSD users are unsatisfactory. A new procedure is reported which consisted of combined individual and group therapy, occasionally adding the LSD users to groups of abstinent patients. This method apparently shortened the initial phase of psychotherapy. The LSD user was characterized as possessing strong fixation in the oral-sucking phase coupled with a few anal traits.

Use of LSD permits decreased psychological efficiency. The character of the LSD user and the heroin addict are completely dissimilar; hence, treatment techniques should vary.—*C. O'Donnell.*

3131. Vel'tishchev, Yu. E., Badalyan, L. O., & Tabolin, V. A. **Uspekhi sovremennoi meditsinskoj genetiki i ikh znachenie dlya pediatrii.** [Achievements of contemporary medical genetics and their significance for pediatrics.] *Pediatriya*, 1970(Dec), Vol. 49(12), 3-8.—Surveys recent findings concerning 3 main types of hereditary pathology: (a) chromosomal aberration, (b) genetic mutation, and (c) hereditary predisposition responding unfavorably in the presence of external factors in the environment.—*I. D. London.*

3132. Voronin, L. G., Kononov, V. F., & Serikov, I. S. (Inst. of Biophysics, Moscow, USSR) **K voprosu o vzaimodeistvii osoznannykh i neosoznannykh sledovykh protsessov v nervnoi sisteme.** [Interaction of conscious and unconscious trace processes in the nervous system.] *Doklady Akademii Nauk SSSR*, 1970, Vol. 195(5), 1237-1239.—123 Ss in 4 age groups between 6-30 yr. of age, a group of 20 chronic alcoholics, and a group of 8 patients with cerebral arteriosclerosis memorized a digit or an animal picture. The E attempted to identify it by calling out digits and picture names and observing GSR and other physiological responses when the Ss replied either "yes" to all questions, "no," or did not give any reply at all. It was impossible to make correct identifications from GSR recordings in the 6-7 yr. old group. Identification improved in the older groups. With adults (18-30 yr. old) who replied "no," the E's guesses were 87% correct. With the adult patients the percentage of correct identifications was the same as with the 14-16 yr. old group: 40-47%.—*L. Zusne.*

3133. Weinstein, Raymond M. & Brill, Norman Q. (Wilkes Coll.) **Conceptions of mental illness by patients and normals.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 101-108.—Mental patients' conceptions of the causes of their illness were recorded and compared to data from 5 other investigations dealing with public attitudes toward the etiology of mental disorders. Results indicate that both patients and normals saw environmental problems and personality or emotional disorders as the main causes of mental illness. Normal persons emphasized hereditary and organic factors; patients, interpersonal and behavioral difficulties.—*Journal abstract.*

3134. Wilder, Joseph. (Main St., Tannersville, N.Y.) **Alfred Adler in historical perspective.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 450-460.—Presents a synopsis of the basic teachings of Alfred Adler. It is suggested that Freud and Adler derived a great deal of their philosophies from Nietzsche. He had postulated the concepts of: (a) subconscious motives, (b) repression, (c) will to power, and (d) the pain-pleasure principle. Major similarities and differences in the theories of Freud and Adler are outlined. The importance of many of Adler's ideas as a major contributor to contemporary dynamic psychology has been greatly underestimated.—*C. O'Donnell.*

3135. Yolles, Stanley F. (National Inst. of Mental Health, Chevy Chase, Md.) **Social policy and the mentally ill.** *Hospital & Community Psychiatry*, 1969-(Feb), Vol. 20(2), 37-42.—"Social policy toward the mentally ill in the United States is now based on the patient's right to receive treatment, and his right to receive it in the most convenient place—his local

community." Unless the health professions can provide adequate treatment, this right is of little importance. Good health care should be comprehensive, have continuity, be focused on the family, and of the highest quality. The role of community mental health centers, the responsibility of mental health professionals, and the relationship between public health and mental health are topics discussed.—*B. A. Burkard.*

3136. Alvord, Jack R. (Utah State U.) **The training of speech-pathologists as behavioral engineers.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4352.

3137. Balcanoff, Eugene J. (Suffolk Superior Court Clinic, Mass.) **The psychiatrist in a superior court setting.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 45-50.—The development of the psychiatrist's role in Suffolk Superior Court is traced through 10 yr. of its operation. Mutual understandings enhanced the gradual numerical increases in pretrial referrals. The most impressive gain to the psychiatrist is the increase in the number of defendants at pretrial level who have been eager to talk about their motivations.—*A. M. Cawley.*

3138. Bagues, Maryvonne & Bagues, Jean-François. (Bethany Clinic, Talence (Bordeaux), France) **Quand on devient psychiatre.** [When one becomes a psychiatrist.] *Evolution Psychiatrique*, 1970(Jan), Vol. 35(1), 101-106.—Going back as far as infancy, an attempt is made to determine why and how a person decides to become a psychiatrist. It is explained that such a wish is usually based on 2 factors: choice and field. The former relates itself to medicine; the latter to a particular field, in this case psychiatry. Some of the prerequisites of psychological profession, e.g., closeness to the patient and the discovery of symptoms are analyzed. (English summary)—*I. Sirotnin.*

3139. Burton, Arthur. (307 Balboa Ave., Davis, Calif.) **The adoration of the patient and its disillusionment.** *American Journal of Psychoanalysis*, 1970, Vol. 29(2), 194-204.—Discusses the distinctive aspects of schizophrenia and its treatment, and analyzes questionnaires from 27 psychoanalysts who deal with schizophrenics to determine: (a) why they elected to become healers of schizophrenia; (b) how they perceive themselves as people and in relationship to their healing work; and (c) if they experienced an adoration of the patient, and was there subsequent disillusionment. Results indicate that Ss came from families in which relationships were in constant jeopardy and were never resolved. They need to adore someone in a way they do not and cannot find at home, and they need "to participate in the miracle and mystique of existence in the fundamental way provided only by the psychotic patient." Thus, they attempt to integrate themselves, find joy, and satisfy the healer role which developed from their family experience. The frequent frustration in attaining these goals leads to disillusionment manifested in Ss' admittance to feelings of giving up healing or leaving psychiatry altogether.—*M. Maney.*

3140. Conway, Ronald. (St. Vincent's Hosp., Melbourne, Victoria, Australia) **On basic assumptions about training for clinical psychologists: A reply to professor S. H. Lovibond.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 115-119. Suggests that traditional psychodynamic systems of psychotherapy cannot

be disregarded as irrelevant to problems of psychological disorder. Studies comparing traditional and behavioral approaches are questioned on the basis of the definition of improvement. Behavioral control techniques, particularly those involving aversive conditioning procedures, are criticized and the behavioral emphasis upon molecular areas of personality disorder is contrasted with the traditional emphasis on molar behavior. The question of who should practice clinical psychology is discussed; it is suggested that the personality of the clinician, rather than his ideological orientation, is the important variable influencing client improvement. The question of research in clinical practice is also raised, and it is concluded that in general behaviorists have failed to create any useful body of personality theory.—*R. Wills.*

3141. de Boer, R. A., et al. (Netherlands Inst. for Preventive Medicine TNO, The Hague) **An evaluation of long-term seminars in psychiatry for family physicians.** *Psychiatry, Washington, D.C.*, 1970(Nov), Vol. 33(4), 468-481.—Attitudes of 378 (out of about 470) general practitioners (GPs) who attended 49 different long-term seminars in psychiatry were compared with attitudes of nonseminar GPs ($n = 734$) and 24 psychiatrists. A concept profile based on the semantic differential technique was used to measure attitudes toward patients with somatic, psychosomatic, and neurotic problems. The seminar members' profile was between that of nonmembers and psychiatrists. Self-concepts of members and nonmembers toward "myself as a family physician" were the same indicating that although their attitudes had changed, seminar members still saw themselves primarily as experts in somatic disease. A significant but modest shift in attitude was found, however, the question remains as to whether this "really matters in terms of effective treatment?" (16 ref.)—*E. M. Upchurch.*

3142. Doron, Roland; Gehmann, Claudine, & Gehmann, Pierre. (4 Rue du General André Talence (Bordeaux), France) **Séminaires de contrôle et de sensibilisation à la psychothérapie d'inspiration psychanalytique: Expérience de 5 ans** [Seminars of control and assimilation of psychotherapy based on psychoanalysis: Experience of 5 years.] *Evolution Psychiatrique*, 1970(Jan), Vol. 35(1), 159-179.—Discusses efforts to use young psychiatrists and psychologists in treating backward children and those with scholastic problems as well as domestic incompatibility. Describes the methods used in 5 yr. of training psychiatrists who were unfamiliar with psychoanalysis. The method included a 2-yr seminar. To prevent the intervention of children's parents, a social director was appointed to handle the problems of this nature, while the therapy was being conducted. The seminars included 6-8 participants, each of whom related his personal experiences when coming in contact with a disturbed child. (English summary)—*I. Sirotnin.*

3143. Flint, Robert T. (U. Minnesota) **The relationship of women's tenure in occupational therapy to Strong Vocational Interest Blank and demographic variables.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4379.

3144. Holmes, T. S. & Holmes, T. H. (U. Washington, Medical School) **Short-term intrusions into the life style routine.** *Journal of Psychosomatic Research*, 1970, Vol. 14(2), 121-132.—Questionnaires about life changes and health changes were answered daily by 55 16-60 yr. old (median age, 23) hospital employees (37

male, 18 female). Results indicate that there are significantly more life changes on the day when a person reports a physical sign or symptom.—*W. G. Shipman.*

3145. **Horányi, Béla.** (Medical U. of Budapest, Hungary) **Az orvosi személyiségről.** [The personality of the physician.] *Pszichológiai Tanulmányok*, 1967, No. 10, 527-531.

3146. **Mueller, Betty S. & Sherman, Clinton C.** (Brentwood Hosp., Los Angeles, Calif.) **Nurses' experiences as psychiatric patients.** *Hospital & Community Psychiatry*, 1969(Jan), Vol. 20(1), 24-25.—For the past 5 yr., each new nurse has been invited to spend a day as a patient, as part of her orientation to a 2400-bed Veterans Administration hospital. 8 out of 9 accept this invitation—to date, 30 nurses. The nurse stays 8 hr. on a closed ward for women and participates in whatever the patients do. After completing her day the nurse writes a summary of her impressions and discusses it with her instructor and other new nurses. Some of the nurses' impressions are included. "The day-long experience, although it obviously is limited, does sometimes spark the nurses' interest in making changes on their own wards whenever possible, to reduce some of the dehumanizing effects of hospitalization."—*B. A. Burkard.*

3147. **Petty, Joseph G.** (Utah State U.) **Predicting counselor trainee success.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4317-4318.

3148. **Randolph, Christie C.** (Michigan State U.) **Multiple therapy: Co-therapist satisfaction as related to the variables of affection and self-disclosure.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4344.

3149. **Rogers, Ruth & Wright, Geneva.** (Larue D. Carter Memorial Hosp., Indianapolis, Ind.) **Psychiatric training for homemakers.** *Hospital & Community Psychiatry*, 1969(Mar), Vol. 20(3), 81-82.—Presents a report by a local family service association, which temporarily places trained homemakers in households that need outside help to care for the children or the home. It is reported that about 30% of the families needed help because of a mentally ill member, usually the mother. A program was developed in which homemakers were included in portions of a hospital's basic training for new psychiatric aides. They receive about 35 hr. of instruction at the hospital, plus several hr. of ward experience.—*B. A. Burkard.*

3150. **Ross, Bonnie; Anderson, Rose, & Koutsky, Carl D.** **Increasing the therapeutic potential of nurses.** *Hospital & Community Psychiatry*, 1969(May), Vol. 20(5), 140-141.—At the Alaska Psychiatric Institute there is an abundance of trained nurses and a shortage of psychiatrists. In preparing nurses for a role that complements the psychiatrist's role, task-oriented approach 5-day workshops are held for all nurses to develop their skills in discovering and meeting patient's emotional needs.—*B. A. Burkard.*

3151. **Roth, Nathan.** (New York U., Medical School) **The strange society of the physician.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 494-498.—Analyzed the apparent life style of the physician in terms of compensating for lacks in medical knowledge. Doctors tended to seek each other out socially to remedy the emotional setbacks of not always being able to successfully treat a patient. The layman then perceived the doctor as a socially exclusive clique. The patient also developed ambivalent attitudes toward the physician. A method for improving doctor-patient relationships is described.—*C. O'Donnell.*

3152. **Schwartz, Steven H., Simon, Roger I., Kirchoff, Laurence, & Bouchard, Kenneth.** (Wayne State U.) **Representation of medical knowledge.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 47-48.—Studied organization of medical knowledge in a group of 13 experienced physicians, 13 residents, and 13 senior medical students, by means of a sorting task involving symptoms of diseases associated with shortness of breath. Results indicate that the experienced physicians took longer and used more items but agreed less among themselves than the other groups. Hierarchical tree structures constructed for each sort revealed that residents differentiate more horizontally (more branches emanating from each node), while the experienced physicians develop their structures more vertically (a greater number of levels in the tree). Qualitatively different schemes of organization were also noted between groups. Limitations in interpretation were pointed out and future research indicated.—*Author abstract.*

PSYCHOTHERAPY & ANALYSIS

3156. **Battegay, Raymond.** (Psychiatrischen Universitäts-Poliklinik, Basel, Switzerland) **Regressionssphänomene aus klinischer Sicht unter besonderer Berücksichtigung analytischer Kurzpsychotherapie.** [Regression phenomena from the clinical viewpoint, with special consideration of analytic short therapy.] *Praxis der Psychotherapie*, 1970(Aug), Vol. 15(4), 151-162.—Discusses several typical cases of regression and recommends helpful attitudes for the therapist. After accepting a patient, the therapist should decide early whether short therapy will suffice in relation to the conflicts, awareness, suffering, and intelligence of the patient. With regression, it is especially important to direct a patient into a spontaneous recognition of the type of his conflicts. The patient should be led to assume responsibility and overcome his troubles by his own efforts. The therapist should keep in mind that maturity cannot be reached without a temporary regression. In regression, a latent hope of the future is hidden. If regression is still possible, there is a chance for that kind of flexibility which leads men to new knowledge, understanding, and transformation. (18 ref.)—*P. van Toal.*

3157. **Bellak, Leopold.** (New York U.) **The role of psychoanalysis in contemporary psychiatry.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 470-476.—Postulated that psychoanalysis as a profession has been firmly incorporated with the rest of psychiatry

and medicine. Psychoanalysis as a personality theory has remained the richest store of hypothetical information. As a specific therapy, its role decreased to an informative level. It is concluded that, role decreased to an informative level. It is concluded that, as a science, psychoanalysis will probably assume an "etiological" overtone.—C. O'Donnell.

3158. Caldwell, Louis O. (U. Houston) **A statistical analysis of selected Houston area pastors' responses to the postulates of O. Hobart Mowrer's integrity therapy.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2678-2679.

3159. Ceccato, Silvio. (U. Milan, Cybernetics Center, Italy) **Freud oggi: Considerazione di indole metodologica.** [Freud today: Considerations of methodological nature.] *Archivio di Psicologia Neurologia e Psichiatria*, 1970(Jul), Vol. 31(4), 330-351.—2 aspects of Freud's work should be considered separately: the therapeutic and the methodological. The former may be valuable whereas the position of the latter looks questionable since it is related to idealistic philosophy. Freud introduced a great many concepts whose definition is destined to remain magical rather than scientific and technical. (French, English, & German summaries)—L. L'Abate.

3160. Committee on Therapy. (Group for the Advancement of Psychiatry, New York, N.Y.) **Psychotherapy and the dual research tradition.** *GAP Report*, 1969(Oct), Vol. 7(73), 97-157.—Reports a clinician's view of psychotherapy, limited to the traditional 2-person relationship. The participants, the aims and assumptions of each, the structure of the relationship, the setting, and the compact are described. A set of reciprocal features, or polarities are proposed that enter into the process of therapy: trusting-mistrusting; gratifying-frustrating; revealing-concealing; encouraging fantasy testing reality; reliving-new experiencing and regressing-progressing. A hypothetical description is given of psychotherapist and research scientist, highlighting differences between the 2 as idealized types. A brief historical sketch is given of the dual tradition that runs through much of research emphasizing the cyclic nature of scientific revolutions and the prestige of those approaches that are in the ascendance at a given time. At present the experimental approach has such prestige. The variety of efforts to study psychotherapy using experimental models is described. An alternative approach, the naturalistic, is also described, along with its strengths and weaknesses. An integrated view of psychotherapy and research is presented and points to ways in which naturalistic and experimental approaches are inevitably combined. Some of the conflicting aims, and the confluent purposes, between psychotherapist and scientist are discussed. (118 ref.)—*Journal summary*.

3161. Cooper, A. J. (U. Edinburgh, Scotland) **Frigidity, treatment and short-term prognosis.** *Journal of Psychosomatic Research*, 1970(Jun), Vol. 14(2), 133-147.—Reports results of a year's treatment of each of 50 frigid women. 48% responded to a treatment which included progressive relaxation, improving partner's stimulation techniques, sexual education, and biweekly individual psychotherapy of variable depth. Variables found predictive of outcome included recent onset and short duration of frigidity plus favorable attitudes toward the spouse, coitus, and the genitalia of self and spouse. (46 ref.)—W. G. Shipman.

3162. Cornelissen, Reinout L. (Maarsen, Zandweg 31,

Netherlands) **Regressive Tendenzen und Symptome der Patienten in der ärztlichen Sprechstunde.** [Regressive tendencies and symptoms of the patient in the consultation room.] *Praxis der Psychotherapie*, 1970-(Oct), Vol. 15(5), 220-221.—Regression may be necessary in therapeutic contact, but too much of it causes ambivalence and aggression, and too little indicates insufficient contact. Regressive symptoms can be recognized on the assumption that there are 3 strata: a primary, mainly chromosomally coded; a secondary, exogenously coded, and a 3rd that is "immaterially" coded or not coded at all. Human sexual behavior serves as an example. The lower animal stratum is directed to collective sex without morality. In the 2nd stratum, loyalty to 1 person is reached. The 3rd stratum again leads to collective but immaterial (spiritual) love in the sense of the New Testament. Evolution seems to move in the direction of the 3rd stratum. The functions of the 1st and 2nd stratum could be regarded as a regression in relation to the 3rd stratum and long process of evolution. To achieve optimum therapeutic results, the therapist must learn to systematically relate his own experiences, especially in regard to the 1st and 2nd stratum. The essential, therapeutic result can only be achieved by personal devotion resulting from the 3rd stratum.—B. Schay.

3163. Deutscher, Max. (William Alanson White Inst., New York, N.Y.) **Brief family therapy in the course of first pregnancy: A clinical note.** *Contemporary Psychoanalysis*, 1970(Fal), Vol. 7(1), 21-35.—Assumes that "pregnancy has begun to be seen as one of the later growth phases in young adult life, one taking place within the structure of a developing family." Study is based on taped and transcribed interviews with 10 middle-class, white, Protestant couples in their middle or late 20s with each spouse seen individually in the 2nd trimester and together at the 3rd postpartum mo. Data were established from clinical impressions of the protocols. Findings and observations revealing factors such as general family philosophy of mutual decision-making, motivation for pregnancy, shock of pregnancy, various fantasies, uneventful delivery with husband's presence, and reorganization of family around presence of child, constitute the framework for brief psychotherapy with "pregnant couples" which were considered successful. 2 case examples are given. (24 ref.)—M. J. Stanford.

3164. Dignam, Patrick J. (Anclote Manor Hosp., Tarpon Springs, Fla.) **Monetary transactions as a therapeutic issue.** *Hospital & Community Psychiatry*, 1969(Apr), Vol. 20(4), 112-114.—Describes Anclote Manor, a 76-bed nonprofit hospital in which most patients were permitted to set up a budget and to deposit and withdraw money through the business office. Some were permitted to handle all their financial obligations, in and out of the hospital. A composite case history illustrating some of the problems and benefits that resulted is included. Money can be used pathologically and it offers clues to underlying emotional issues. "The acquisition and use of money is a vital feature of our society, and it should therefore be a vital part of a psychiatric treatment program designed to help patients function successfully in society."—B. A. Burkard.

3165. Feiner, Arthur H. (Young Adult Treatment Center, New York, N.Y.) **Toward an understanding of the experience of inauthenticity.** *Contemporary Psychoanalysis*, 1970(Fal), Vol. 7(1), 64-83.—Explores communications among people which in some instances

result in behavior symptomatic of mental disease. This "inauthentic" communication, a word coined by the author, "refers to the verbal articulation of our inner experience of an interaction with another person when we come to believe that his communicative gestures reflect his attempt at finding himself in the other." Reification, mystification, double-bind, boundary invasion, privacy invasion, and attributions are discussed as aspects of inauthentic communications. The theory of antecedents is viewed as a theory of technique concerned with the problem of experience of inauthentic communications. Bringing antecedents into a patient's awareness helps him to discover himself as an autonomous, separate being. This therapy of antecedents as one of experience and not of excavation forces the therapist to question "Who says what to whom, in what way, under what conditions, with what intention and how is it experienced." (28 ref.)—*M. J. Stanford.*

3166. Garonne, G. & Thévenoz, L. (U. Geneva, Medical School, Switzerland) **Los problemas planteados por la readaptación social del enfermo mental: Factores determinantes de una organización psiquiátrica sectorial.** [Problems presented by the social readaptation of mental patients: Determining factors in a sector organization in psychiatry.] *Revista de Psiquiatría y Psicología Médica*, 1970(Jan), Vol. 9(5), 297-311.—The social readaptation of the mental patient has become the primary goal of psychiatric therapy. At first, the notion of readaptation was conceived of primarily as recovery of the patient after having lost his social and occupational ties because of prolonged hospitalization. The notion has now been enlarged to pervade the entire field of psychiatry. Psychiatry, as a result, has evolved toward a social psychiatry. While initially readaptation was a type of reeducation for work and depended on organizations separate from the mental health system, it is now more of a reintegration by means of work accomplished by organizational entities within the psychiatric system itself. In the canton of Geneva, this system is called a sector and its structure, personnel, and functioning are described in some detail.—*L. Zusne.*

3167. Geleerd, Elisabeth. **Introducción a la mesa redonda sobre análisis de niños: La fase de separación-individuación: Observaciones directas y reconstrucciones en análisis.** [Introduction to the roundtable discussion on analysis of children: The separation-individuation phase: Direct observations and reconstructions during analysis.] *Revista de Psicoanálisis*, 1970(Jan), Vol. 27(1), 141-148.—Bearing in Mind M. Mahler and K. Perriere's observations on the 4 subphases of individuation (initial differentiation of the mother-child dual unit, practice period, rapprochement, and object constancy), conclusions are drawn from clinical material that (a) the subphases of practice and rapprochement cannot easily be reconstructed, and (b) the symbiotic phase lasts until object constancy is achieved. Although minute observations of these subphases cannot be made during clinical psychoanalysis, the latter is seen as essential (by supplying data on drives, defenses, and ego and superego development) to their understanding. Data are presented on 2 clinical cases, illustrating conflicts related to symbiosis and the repetition of conflicts founded in the anal phase of libidinal development which coincides with the practice and rapprochement subphases. (English & French summaries)—*T. N. Webster.*

3168. Gordon, Alan S. (U. Tulsa) **A comparison of**

homogeneous versus heterogeneous grouping using client-centered therapy with neurotics and schizophrenics. *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3705.

3169. Graf Dürkheim, Karlfried. **Das problem der Regression auf dem Weg zum wahren Selbst: Initiatische Therapie.** [The problem of regression on the road to the true self: Initiatory therapy.] *Praxis der Psychotherapie*, 1970(Jun), Vol. 15(3), 107-121.—Regression is commonly defined as a temporary or permanent stepping back to the state of an earlier ontogenetic or phylogenetic stage. At first glance, regression appears in its negative meaning as an evasion, chiefly of new responsibilities. Positive aspects appear due to the fact that all growth implies a change, and that progress is often preceded by a temporary regression for the regeneration of the whole. Thus it can be applied in therapeutic treatments for the restoration of suppressed developments. In depth psychology, regression appears as a retreating through peak experiences into a new dimension of consciousness, comparable to the experiences of the mystics throughout the ages; if of short duration, a "regression" into everyday consciousness follows. To achieve a permanent consciousness of "higher realities," a "transparency of transcendence" should be developed. For this purpose, "initiatory therapy" is recommended. It might be called "creative regression in serving a depth beyond the single-minded activities of the ego mentality."—*P. von Taal.*

3170. Grinberg, León. (Pueyrredón 2395, 10°, Buenos Aires, Argentina) **Ideas nuevas: Conflicto y evolución.** [New ideas: Conflict and change.] *Revista de Psicoanálisis*, 1970(Jan), Vol. 27(1), 43-71.—Reviews past, present, and future perspectives of psychoanalysis, stressing the problem of stagnation in psychoanalytic development, and pointing up how prejudicial resistance to new ideas can hinder the development of psychoanalysis. Dogmatic attitudes and parochialism are pernicious factors which can hinder the advances of analytical theory, and impede genuine communication between analysts. The fate of the Kleinian theory is offered as a model of this conflict between dogmatists and innovators. Further areas discussed include (a) characteristics of the Latin American psychoanalytic community, described for the benefit of other analysts in the International Psychoanalytical Association; (b) ideas for the future of psychoanalytical research, discussed on the basis of improved communication between analysts of different schools of thought by means of the common denominator: clinical language; and (c) current social problems, to which analysts should apply their particular skills to aid in their solution. (61 ref.)—*T. N. Webster.*

3171. Gross, Ján & Sváb, Ludvík. (Psychiatric Research Inst., Prague, Czechoslovakia) **Die experimentelle sensorielle Deprivation als Modellsituation der psychotherapeutischen Beziehung.** [Experimental sensory deprivation as a model situation of psychotherapeutic relations.] *Nervenarzt*, 1969(Jan), Vol. 40(1), 21-25.—It has been proven experimentally that the feeling of social isolation greatly influences human behavior. Social isolation is mainly perceived in 2 ways: as an absence of undesirable controls, or as a lack of possible help from an outside source. The predominance of 1 of these aspects seems to depend on time organization. Tests made with 33 healthy male pilots, placed in an isolation chamber, have shown that the lack of information coming from the outside and, at the same

time, the inability of testing the surrounding realities makes the Ss, tested in sensory deprivation, dependent on the outside E to such a degree that his relation to the E changes into a specific interpersonal relation, which might be viewed as a model of the relation of the patient to the psychotherapist. (19 ref.)—*P. von Toal*.

3172. **Guerello, Maria D.** **Abandono del tratamiento de psicoterapia infantil.** [Abandonment of treatment in child psychotherapy.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Dec), Vol. 16(4), 361-364.—A child's illness is seen as the expression of the family group's illness in him. Therefore, reasons for desertion of treatment may be of 4 types: (a) when the group denies the child's illness and the necessity of a reparative psychotherapist; (b) when the group feels so destroyed that hopelessness causes it to stop treatment; (c) when the group perceives the therapist as a persecutor and the child as their threatened part; and (d) when the group perceives both the therapist and the child as persecutors, its defensive mechanisms are not sufficient, and fear of annihilation makes it stop the treatment.—*English summary*.

3173. **Hirsch, Margit.** **Nevelés és pszichoterápia.** [Education and psychotherapy.] *Pszichológiai Tanulmányok*, 1967, No. 10, 797-801.

3174. **Kopp, Sheldon.** (George Washington U.) **The Wizard of Oz behind the couch.** *Psychology Today*, 1970(Mar), Vol. 3(10), 70-73, 84.—Many psychologically troubled people are similar to the characters in the story of the *Wizard of Oz* in that they possess the resources to obtain relief but they do not believe that they do. Just as Dorothy and her friends asked the wizard to cure them, many patients ask their therapists to direct them to a cure. Therapists are also very much like the wizard because they cannot cure but they can help the patient to become involved in helping others and thus to discover the resources they possess.—*E. J. Posavac*.

3175. **Kraft, T.** (Claybury Hosp., Woodford Bridge, England) **Some thoughts on the role of the therapist in behavior therapy.** *Perceptual & Motor Skills*, 1971-(Feb), Vol. 32(1), 277-278.—Comments on the relation of the form of therapy chosen by therapists to their personality characteristics are made.—*Journal abstract*.

3176. **Kriegsfeld, Michael.** (New York U.) **An investigation of the relationship of some psychotherapist variables to the outcome of treatment with patients of different social classes.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4339-4340.

3177. **Lebovici, S.** **Indications et contre-indications de la psychanalyse.** [Indications and contra-indications for psychoanalysis.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(9-10), 533-539.—Psychoanalysis is most successful with conversion symptoms, phobias, obsessional neuroses, and other neurotic reaction patterns. It is not likely to be successful with those individuals whose self-structure is fundamentally masochistic, nor with homosexuals, psychopaths, delinquents, and mental retardates. Perverts, addicts, psychotics, psychosomatics, habitual criminals, and children have been analyzed with varying success.—*R. E. Smith*.

3178. **Lesse, Stanley.** **Prophylaxis and psychotherapy.** *Canada's Mental Health*, 1971(Jan), Vol. 19(1), 21-23.—Suggests that in the future the orientation of psychotherapy will shift from disease to health and prevention. Diagnosis will become the province of automated systems, and therapists will be concerned with prophylaxis, with evaluation of the impact of social

changes and systems on the individual. A new field will emerge, psychosociology, which will encompass psychiatry, psychology, social science, and political science. Health science memory banks will contain all the medical data of an individual and periodic scanning by a computer will identify those in need of therapy for incipient disorders. Treatment at that level will require new theories and techniques. It is concluded that at the present time psychotherapy is primarily concerned with psychodynamics and rehabilitation; in the future the interrelationship with sociodynamics will become more important and prevention will be the primary activity.—*S. Knapp*.

3179. **Lindenauer, Geoffrey G.** **Milieu therapy: A survey.** *Journal of Emotional Education*, 1970(Win), Vol. 10(1), 4-9.—Reviews the history of the use of environment as a form of therapy from 1929 to the present. A therapeutic community for the "normal" neurotic, an individual with inter- and intrapersonal difficulties who is still able to function in society, is described. The program uses work or education as a therapeutic tool, encourages deep interpersonal relationships, involves the client in the community, conducts workshops in interpersonal relations and identity, and concentrates on present activities rather than the client's past. Such activities in such an environment are described as providing the client with the opportunity to learn how to give and receive love.—*S. Knapp*.

3180. **Meissner, W. W.** (John La Farge House, Cambridge, Mass.) **El soñar como proceso.** [Dreaming as a process.] *Revista de Psicoanalistas*, 1970(Jan), Vol. 27(1), 73-110.—Reviews recent research in the fields of neurophysiology and psychoanalysis on the nature of the dream process, including: (a) activation patterns during dreaming; (b) REM concomitants (EEG, EMG, and EOG patterns); (c) dream deprivation; (d) sleep as a therapeutic method; (e) REM mental activity; and (f) metapsychological considerations. (61 ref.)—*T. N. Webster*.

3181. **Nikelly, Arthur G.** (U. Illinois) **Psychological politics.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 403-404. Psychological evaluation and therapy of student dissenters or draft evaders is a political process as the therapist fulfills the desires of political attitudes instead of promoting human welfare. While psychologists advance the aims of the establishment and support the status quo they suppress the common human well-being. Psychological evaluation and psychotherapy tend to weed out the misfit and to psychotherapize him into conformity usually disguised with the equivocal concept of "adjustment." Nonadjustment to psychologically harmful conditions is a healthy reaction but often labeled "maladaptive." The psychologist must be consistent with the goals of his profession and oppose the forces hindering psychological health. *Author abstract*.

3182. **Portela, Jarbas M.** (Federal U. Minas Gerais, Belo Horizonte, Brazil) **Social aspects of the psychoanalytic practice.** *Contemporary Psychoanalysis*, 1970(Fal), Vol. 7(1), 105-111. Remarks are based on the author's experience with a restricted group of 20-30 yr. old mainly unmarried students or graduates. A type of clash between old familial and new values is seen as demonstrated in a case cited. No structured symptom such as phobia, obsession, etc., exists. Patients present a world of protest. Their internal conflict is reflected in the disintegration of modern society. The analyst has to be

cognizant of the social conflicts of which he partakes. Often he and the patient are part of the same social scene. The analyst has to avoid emphasizing intrapsychic conflicts and should stress social problems. He cannot remain ideologically neutral and "must be aware of and critical of the reality principle he presents to the patient. Such criticism may lead to self-transformation and sufficient inner freedom to enable the analyst to respect and enhance the patient's freedom."—*M. J. Stanford.*

3183. **Rogers, Rita.** (U. California, Los Angeles) **The "unmotivated" adolescent patient who wants psychotherapy.** *American Journal of Psychotherapy*, 1970 (Jul), Vol. 24(3), 411-418.—Discussed the problem of successfully relating to, and treating, teen-aged patients who have assumed characteristics of not being motivated for therapy. 23 adolescents who were brought to the psychiatrist against their wishes were studied. The 1st encounter with the therapist and attempts at communication were dismissed by the patient who refused treatment. A period of "disengagement" (of varying lengths of time) was followed by patients return on his own will. A successful therapeutic relationship was then established. It is suggested that the teen-ager has a particular method of expressing his needs, and uses different ways of relating himself to his environment. Therefore, his methods of communication with the "adult" world remain unique to him.—*C. O'Donnell.*

3184. **Rosen, Victor H.** (262 Central Park West, New York, N.Y.) **Introducción a la mesa redonda sobre lenguaje y psicoanálisis.** [Introduction to the round-table discussion on language and psychoanalysis.] *Revista de Psicoanálisis*, 1970 (Jan), Vol. 27(1), 27-34.—Surveys various close relationships of linguistics and psychoanalysis, including (a) psychoanalytic contributions to the psychopathology of language; (b) linguistic aids in understanding basic ego organization patterns; (c) similarities in analytical methodology; (d) similarities of clinical theory and study of specific idioms; (e) shared interest in the communicative function of gestures and mimesis; (f) importance of each as an auxiliary discipline of the other; (g) recent interest in the particular relation between audition and psychic structure development; (h) vocal-auditory interchange peculiarities inherent in the analytical situation; (i) the linguist's role in exploring the symbolic significance of neurotic symptoms; (j) sharing in the examination of language and psychoanalysis from the clinical as well as the theoretical viewpoint; and (k) interest in the relation between language and both normal and pathological thought processes. (31 ref.)—*T. N. Webster.*

3185. **Rubins, Jack L.** (New York Medical Coll., New York) **Religion, mental health and the psychoanalyst.** *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 127-134.—Discusses changes in today's concepts and functions of religion, and the increasing involvement of psychoanalysts in mental health. Changes in religious concepts are described as (a) new concepts of God, (b) decentralization of authority, and (c) new dimensions in the role and functions of religion. 3 questions are discussed, raised by an article by A. Apolito (see PA, Vol. 46:Issue 2): (a) at what point and by what criteria can it be said that the patient's religious problems are sufficiently analyzed; (b) will the belief in the existence of the soul, in religious patients, pose an obstacle to analysis; and (c) will the analyst's personal unresolved conflicts prevent understanding of religious problems in the patient.—*H. Roemmich.*

3186. **Schofield, William.** (U. Minnesota) **The psychotherapist as friend.** *Humanitas*, 1970 (Fall), Vol. 6(2), 211-223.—5 basic theses are examined: (a) man has a need for close personal relationships with at least a few other individuals; (b) the essential nature of the relationship between friends entails selective interdependency; (c) several major characteristics of urban life either present or dilute the functions of friendship; (d) when the channels for forming, maintaining, and using the friendship relationship are closed or constricted, the deprived individual will look for approximations; and (e) in 20th century Western culture, the professional psychotherapist is a sanctioned substitute friend for the otherwise friendless, frequently without full awareness of the substitution by either parent to the contract. (18 ref.)—*O. Strunk.*

3187. **Spiegel, Rose.** (William Alanson White Inst., New York, N.Y.) **Psychoanalysis: For an elite?** *Contemporary Psychoanalysis*, 1970 (Fall), Vol. 7(1), 48-63.—This defense of psychoanalysis, a presentation at the 3rd International Forum of Psychoanalysis in Mexico City in 1969, is directed against criticisms and attacks "on the American scene" although they have not been unfamiliar to analysts in other lands. The topic is limited to discussion of psychoanalysis for an elite of patients and practitioners. Freudian and non-Freudian analysts concentrate their efforts upon "superior" types of patients who are essential for "successful" analysis. Others consider psychoanalysis an "aristocratic method" applicable for a few by a few, meaning that practitioners and patients have to possess high qualifications and certain qualities of potential excellence. This selectivity although having a wide range of variability limits the number of "treatable" patients considerably. Solution of this dilemma is seen in considering the individual as the elite emphasizing his uniqueness and thus involving "more than a select few." (25 ref.)—*M. J. Stanford.*

3188. **Vouin, Philippe.** (Psychiatric Hosp., Cadillac, France) **Approches linguistique et sémantique du discours.** [Linguistic and semantic approaches to speech.] *Evolution Psychiatrique*, 1970 (Jan), Vol. 35(1), 181-198.—Presents an individual and collective survey of the part played by language in clinical, psychopathological, and therapeutical approaches to the patients. Efforts were made to establish a linguistic and semantic method applicable to any kind of a language. This encompassed studies in stylistic speech, linguistic deviations, semantic relations, wording, and enunciation. The wording was found to be especially feasible in human communication. It is emphasized that communication is a big problem and that a breakthrough in this field might lead to more effective discoveries in the treatment of mental disorders.—*I. Sirotnin.*

3189. **Wenkart, Antonia.** (American Inst. for Psychoanalysis, New York, N.Y.) **Spatiality: A concern of the psychoanalyst.** *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 145-154.—Describes various instances of how spatiality has changed man's physical and psychological environment so that it has become an important aspect in man's daily life. Psychoanalytic practice that is limited to man's inner conflicts is not considered to be dealing with today's world as a total environment. It is concluded that "spatial extensions of the scope of human concerns is in order if we are to help increase the individual's responsibility toward the world and the world's responsibility toward the individual."—*H. Roemmich.*

3190. Wolf, William. (40 W. 59th St., New York, N.Y.) **Dealing constructively with our increased leisure.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 440-449.—Called for an extensive study of the implications of increased leisure time. A problem for the psychotherapist would be in attempting to determine what each individual really wants to do with his life. "Factorializing" each person's psychologic profile which would then be matched with a list of existing and/or potential activities is proposed. Social values and pressures would be subject to change. It is suggested that psychiatrists "gear" themselves to this changing society in order that they will be able to help their patients adjust to increased leisure time.—C. O'Donnell.

3191. Zupnick, Stanley M. (U. Louisville) **The effects of varying degrees of a peer-model's performance on the extinction of a phobic response in an individual or group setting.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3719.

Therapeutic Process

3192. Apolito, Arnaldo. (New Jersey Coll. of Medicine, Montclair) **Psychoanalysis and religion.** *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 115-126.—Examines the difficulties in dealing with religion in psychoanalytic therapeutic relationships. These are described as arising from the nature of man and his capacities to deal with internal and external forces, from the nature of religion, and from the therapist's personal attitude toward religion. No prescription is given for the therapist regarding religious affiliation, but, religious or not, the therapist must be aware of his own position in regard to religion in order to deal with a patient's religious conflict. In a discussion of Apolito's views, A. N. Franzblau deals with Apolito's discussion of Freud's attitude toward religion, the characteristics of a "mature" religion, and the analyst's religious orientation as a factor in his work with patients. Many ideas expressed in Apolito's article are supported. (19 ref.)—H. Roemmich.

3193. Betz, Barbara J. (Dartmouth Medical Coll.) **Attitudinal interactions in psychotherapy.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 477-484.—Viewed mental distress as a reflection of an immature personality. Through a series of attitudinal interactions, the therapist recognized the needs of the patient. While supporting these current goals, he directed the patients toward more mature perspectives. The basic functions of personality—initial perception of cues, processing of cues, and reactive behavior to the cues—are discussed in relation to narcissism, ego-centricity, and ability to transcend the personal viewpoint. The dynamics of therapy are seen as a series of "maturational sequences."—C. O'Donnell.

3194. Garfield, Sol L. & Bergin, Allen E. (Washington U.) **Therapeutic conditions and outcome.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 108-114.—Reports a study of the relationship of accurate empathy, warmth, and genuineness to outcome in psychotherapy with 21 predominantly non-client-centered therapists. No relationships were secured between tape-rated measures of the 3 therapeutic conditions and a variety of measures of outcome. While accurate empathy and warmth were significantly correlated in a positive direction, both were negatively correlated with genuineness. The 3 therapeutic conditions were not significantly correlated with measures of the therapists'

personal characteristics secured from the EPPS. Findings are discussed and questions are raised concerning the meaningfulness and generality of the 3 therapeutic conditions. (17 ref.)—*Journal abstract.*

3195. Melnick, Barry. (Michigan State U.) **Patient therapist identification in relation to both patient and therapist variables and therapy outcome.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4341-4342.

3196. Powell, Thomas L. (U. Arkansas) **An investigation of the effectiveness of therapist-patient dyads in an initial psychotherapy interview under conditions of A-B complementarity and similarity.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3713-3714.

3197. Searles, Harold F. (Washington Psychoanalytic Inst., D.C.) **Autism and the phase of transition to therapeutic symbiosis.** *Contemporary Psychoanalysis*, 1970(Fal), Vol. 7(1), 1-20.—This is the 2nd in a series of papers reporting the author's current concepts about autistic symbiosis and individuation. During the autistic phase of treatment an analyst's attempts at transference-interpretation meet with the patient either ignoring or deriding them or being deeply disturbed by them. During the phase of transition between autism and therapeutic symbiosis a patient's formerly autistic automaton-like mode of functioning begins to give way to a more fluid behavior where transference-interpretations can be made. In the subsequent phase of therapeutic symbiosis these interpretations "are almost limitlessly in order." In discussing some aspects of sessions with patients the author examines not only the patients' but also his actual responses and those he could or should have made for the good or detriment of the patient. M. J. Stanford.

3198. Wallace, Charles J. (U. California, Los Angeles) **The effects of perceived similarity on perception of the therapeutic relationship.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4349.

3199. Wittich, Georg H. **Regression und therapeutische Technik.** [Regression and therapeutic technique.] *Praxis der Psychotherapie*, 1970(Oct), Vol. 15(5), 221-238.—Regressive processes always take place between 2 or more persons, 1 of whom is the doctor himself. In treating the patient, therefore, the therapist has to consider and control both the patient's and his own regressive tendencies. There are many indications that society cannot do without the regressor. Doctors, hospitals, and society need the regressor to protect their own identity and satisfy their own needs. Sociometric studies show that in most psychosomatic clinics regressive groups of 2 or 3 are formed. It has been proven with patients suffering from organ neuroses that there exists a correlation between successful clinical therapy and social contact. Therefore, in the treatment of regression, psychotherapy has to be group-oriented. Pathogenetically significant processes have to be perceived not only in the patient but in the therapist and society as well. These processes and their interference have to be assessed correctly and increasingly directed in a more realistic manner. (19 ref.)

3200. Woody, Robert H. (Grand Valley State Coll., Counseling & Mental Health Service) **Self-induced age regression: A therapeutic technique for breaking a repression block.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 344-348.—This technique produces valuable therapeutic material, preserves the time of the therapist, and eliminates the requirement for specialized

training. Self-induced age regression is not a hypnotic technique per se. The therapist is merely training the patient to be more effective in his introspections; it is an educational technique.—*D. Prager.*

Group Therapy

3201. **Battegay, R.** (Basel U., Psychiatric Polyclinic, Switzerland) **Gruppenpsychotherapie versus individuelle Psychotherapie.** [Group psychotherapy versus individual psychotherapy.] *Nervenarzt*, 1970(Sep), Vol. 41(9), 429-433.—Notes that group therapy reaches deeper, under certain circumstances, than individual therapy; the latter, however, is a more thorough method. In therapeutic groups, patients can more easily evade the therapeutic effort than during individual treatment. Multiple transfers and resistances are more difficult to assess in a group than in individual sessions. The therapeutic goal in group treatment is mainly an attitude and behavior analysis, repeatedly founded, however, on basic conflicts. Conflict analysis acquires more weight in the more intimate relations between the therapist and his patient in single session. In group analysis, reconditioning and the social learning process are of special importance, while individual psychotherapy stresses the insight and the retraining of the mind. Intense group work is recommended for the reducing of secondary narcissism. A combination of both therapies can be indicated when thorough mind training of a patient in single session is to be combined with his gaining new perspectives in his social behavior.—*P. von Toal.*

3205. **Lafforgue, J., Demangeat, M., & Higounenc, C.** (Château-Picon Hosp., Bordeaux, France) **Langage et corps: Réflexions au terme du séminaire de relaxation.** [Language and body: Comments about a seminar on relaxation.] *Evolution Psychiatrique*, 1970(Jan), Vol. 35(1), 199-214. Comments on a seminar conducted on Bordeaux, France with the participation of 5 identical, 12-person groups, stressing language and body articulation. In the course of the experiment, speech was given and transmitted by the commentator. Later this speech was again received, incorporated, and restored by the Ss

of the seminar. The ability to do so is attributed to the fact that the creator of the method personally was involved in the experiment. It is concluded that "the language of the method" is really a verbal transfer of the initiator's ideas to the Ss and their assimilation of the same by means of joint concentration. (English summary)—*I. Sirotnin.*

3206. **Lessor, Louis R.** (Family Service Assn. of Oak Park & River Forest, Ill.) **Time-extended group treatment sessions.** *Social Casework*, 1971(Feb), Vol. 52(2), 97-103.—Examines the extended session of group therapy, the marathon, focusing on format, process, and techniques. Some questions are raised about the utilization of this treatment mode. Diagnostic indicators need to be developed that will point to situations and individuals for whom this technique is indicated. In a society in which the human being is increasingly isolated and dehumanized, the marathon offers one creative way for the attainment of intimacy between people.—*M. W. Linn.*

3207. **MacLennan, Beryce W. & Levy, Naomi.** (3719 Reservoir Rd., Washington, D.C.) **The group psychotherapy literature 1969.** *International Journal of Group Psychotherapy*, 1970(Jul), Vol. 20(3), 380-411.—"The popularity of groups continues and the ferment and controversy grow." The highlights of the bibliography are discussed under the following categories: children, adolescents, inpatient treatment of adolescents, mentally retarded, college counseling, special problems, the therapeutic milieu in hospitals and halfway houses, professional and nonprofessional roles in group psychotherapy, training, technical questions in group psychotherapy, videotape, small-group research, and clinical research. (418 ref.)—*I. Linnick.*

3208. **Mohr, Kent E.** (Indiana U.) **An evaluation of marathon group procedures and leaders as measured by the Structured Objective Rorschach Test (S.O.R.T.).** *Dissertation Abstracts International*, 1970-(Dec), Vol. 31(6-A), 2741.

3209. **Parloff, Morris B.** (National Inst. of Mental Health, Lab. of Psychology, Bethesda, Md.) **Group therapy and the small-group field: An encounter.** *International Journal of Group Psychotherapy*, 1970(Jul), Vol. 20(3), 267-304.—"Admittedly the fields of 'small groups' and of group psychotherapy, like society itself, are in flux. . . . While there is little agreement regarding the definition or characteristics of groups variously labeled as personal growth, human relations, sensory awareness, sensitivity training, self-awareness, leadership training, love-ins, psychological karate, etc., it is generally agreed that they represent a potent force for great benefit or great mischief. . . . While leadership training and the adherence to sound ethical practices cannot guarantee elimination of negative effects, they can do much to minimize their occurrence. The dangers of indiscriminate application of these procedures by undisciplined leaders to the psychologically unstable are apparent." Although the author encourages the analytic group psychotherapist to explore the principles and techniques of the encounter group in order to expedite the treatment of patients, he questions his competence and goals with nonpatients. (53 ref.)—*I. Linnick.*

3210. **Pinney, Edward L. & Weidenbacher, Richard.** (21 E. 66th St., New York, N.Y.) **The outcome of group psychotherapy in a group used for teaching.** *Psychiatric Quarterly*, 1970(Apr), Vol. 44(2), 271-280.—Utilized a psychotherapy group in an outpatient clinic to

teach psychiatry residents. 11 of 16 patients treated by these residents were reported as improved after a 1-yr period. Specific training and supervision for group psychotherapy is essential for a favorable outcome. It is concluded that group psychotherapy can be a worthwhile treatment for severely ill patients in an outpatient psychiatry clinic.—D. Prager.

3211. Reddy, W. Brendan. (U. Cincinnati) **Sensitivity training or group psychotherapy: The need for adequate screening.** *International Journal of Group Psychotherapy*, 1970(Jul), Vol. 20(3), 366-371.—Focuses on the changes in pathology indices of volunteer T-group participants. 4 groups were used in the study: 2 sensitivity training groups (Ns = 13 and 19), 1 psychotherapy group (N = 10), and 1 control group (N = 26). The groups included males and females and had median ages in the low 20s. The Tennessee Self-Concept Scale, Clinical and Research Form was administered to Ss in each group before the first meeting and following the final meeting. The T-groups met 1 evening a wk. for 12 wk. and were led by a National Training Laboratory developed trainer; the psychotherapy group met for 1 1/2 hr/wk. for 12 wk. with an experienced clinical psychologist as the group therapist; the control group was an introductory psychology class which met for 11 wk. The Number of Deviant Signs, according to the author of the test, is the instrument's best index of psychological disturbance. A summary of the results indicates that "The 2 personal-growth-oriented T-groups showed significant changes in the direction of greater pathology from pre- to postmeasurement. The psychotherapy group did not reach significance but approached this level in the opposite direction . . . The control group showed no significant change." It is concluded: "If sensitivity training is to take its rightful place as a major educational and re-educational technique, it is essential that there be adequate screening of prospective participants. Moreover, further research into the variables surrounding this technique should be initiated."—L. Linnick.

3212. Sperling, E. **Alters-und Bezugsgruppen: Spezifische Therapieprobleme; dargestellt am Beispiel der Studenten-und Familienbehandlung.** [Age and reference groups: Specific therapy problems exemplified by student and family treatment.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1969, (Apr), Vol. 15(2), 119-126. Presents a lecture delivered at the International Working Conference of the German Psychoanalytical Society and the International Forum for Psychoanalysis, which discusses the problems of including the social dimensions into psychotherapy and experiences with groups of students and married couples as well as joint sessions with anorectic families. The sociodynamic problem of alternating disturbances in different members of the family is emphasized. In treatment centering on reference groups, different forms of resistance against group formation were noticed. Student groups frequently remained in a "pregroup" state. Marital groups showed an extreme tendency to polarize, and in family sessions the role of the scapegoat was delegated alternately.—B. Schuy.

3213. Taylor, Davis W. (North Texas State U.) **Group systematic desensitization with test-anxious college students.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4347.

3214. Wiesenhütter, Eckart. **Entwicklung, Reifung, Retardation, Regression.** [Development, maturity,

retardation, regression.] *Praxis der Psychotherapie*, 1970, (Jun), Vol. 18(3), 122-132. Stresses the necessity of the "gestalt-circular" approach by further explaining the concepts involved. A number of pertinent cases of family conflicts are presented. Concerning disturbed families, relief from retardation and regression caused by the narrowness of single-family life can be found in multiple family and interest groupings, leading to further development and maturity. The true task of modern psychotherapists is seen in eliminating retardation by opening the way to "transgression." The actual patients today are not troubled individuals but human society as a whole.—P. von Taal.

Behavior & Conditioning Therapy

3217. Cotler, Sherwin B. (Camarillo State Hosp., Calif.) **Sex differences and generalization of anxiety reduction with automated desensitization and minimal therapist interaction.** *Behaviour Research & Therapy*, 1970(Aug), Vol. 8(3), 273-285.—This study dealt with (A) the effectiveness of automated desensitization with minimal therapist-patient interaction, (B) the effects of therapist-patient sex differences on treatment outcome, and (C) the generalization procedure. Results indicated that automated desensitization was effective in significantly reducing anxiety toward the target behavior, snakes. Sex differences between therapist and client were not a critical factor in treatment outcome. Evidence for generalized anxiety reduction following automated desensitization was less conclusive due to changes that occurred in both experimental and control groups. It was concluded that automated desensitization can be a useful and time-saving psychotherapeutic approach; however, there are certain considerations (e.g. initial instructions, S's control of visualization and relaxation amount of relaxation practice, etc.) which should be taken into account.—A. Baruch.

3218. Cotler, Sherwin B. (Washington State U.) **Sex differences and generalization of anxiety reduction with automated desensitization and minimal therapist interaction.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3301.

3221. Doctor, Ronald M. & Craine, William H. (San Fernando Valley State Coll.) **Modification of drug language usage of primary and neurotic psychopaths.** *Journal of Abnormal Psychology*, 1971(Apr), Vol.

77(2), 174-180.—Utilized verbal operant procedures to modify the dialectic drug language usage of 35 primary and 35 neurotic psychopaths toward more conventional word usage. It was predicted that neurotic psychopaths would evidence greater performance gains than primary psychopaths who, according to prevailing theories, should be less responsive to generalized social reinforcers. It was found, however, that primary psychopaths conditioned better than neurotic psychopaths and that conditioning performance was highly correlated with reports of awareness. Conditioners evidenced significantly greater generalization of reinforced responses than nonconditioners and controls. Results are discussed in terms of conflicting results on psychopathy and conditioning and social learning theory formulations of psychopathy. (28 ref.)—*Journal abstract*.

3222. **Donner, Lawrence.** (U. Maryland, Medical School, Baltimore) **Automated group desensitization: A follow-up report.** *Behaviour Research & Therapy*, 1970(Aug), Vol. 8(3), 241-247.—Reports results of a 5-mo follow-up study on an automated group systematic desensitization treatment for test anxiety. The study focuses on data relevant to: (a) the relative permanency of the automated group technique, (b) comparison of the longer-term effect of the therapist's presence vs. his absence on outcome, and (c) the issue of symptom substitution. The follow-up data indicate that the initial improvement following the automated treatment technique is not only maintained, but that further gains are also evident. The presence vs. absence of the therapist did make a significant difference in the amount of improvement found at the follow-up. 85% of the desensitized Ss did not experience side effects.—*A. Barclay*.

3223. **Freeling, Nelson W. & Shemberg, K. M.** (Bowling Green State U.) **The alleviation of test anxiety by systematic desensitization.** *Behaviour Research & Therapy*, 1970(Aug), Vol. 8(3), 293-299.—"28 test anxious Ss were randomly assigned to a relaxation group, a visual imagery group, and a systematic desensitization group in order to determine the relative effectiveness of each treatment in alleviating test anxiety. Following treatment, significant reductions in self-reported anxiety as determined by pre- and post-Test Anxiety Questionnaire (TAQ) scores occurred only for the systematic desensitization group. An analysis of the number of Ss per group showing reductions in TAQ score further supported the hypothesis that self-reported test-anxiety reduction occurs more reliably when both components of systematic desensitization are present. However, when the 3 groups were compared directly, only the visual imagery group was found to differ significantly from the systematic desensitization group, suggesting that relaxation alone may not be a totally ineffective treatment procedure. Results obtained with a 2nd index of anxiety-reduction, performance on an anagram solution task, were not consistent with the self-report data."—*A. Barclay*.

3224. **Glick, Burton S.** (City Hosp. Center, Mt. Sinai Hosp. Services, Elmhurst, N.Y.) **Some limiting factors in reciprocal inhibition therapy.** *Psychiatric Quarterly*, 1970(Apr), Vol. 44(2), 223-230.—The improvement rate in 26 phobic patients immediately after desensitization therapy was 42%. Follow-up, 16-36 mo. later, showed a decline in the improvement rate to 31%. Considering the great difficulty in treating phobic patients successfully, these results should not be condemned. Reciprocal

inhibition treatment is a worthwhile addition to the psychiatrist's armamentarium and should be used wherever indications and expectations warrant it.—*D. Prager*.

3225. **Hekmat, Hamid & Vanian, Daniel.** (Wisconsin State U., Stevens Point) **Behavior modification through covert semantic desensitization.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 248-251.—Matched 12 male and 18 female snake-phobic undergraduates on degrees of behavioral avoidance and subjective fear. Ss were randomly assigned to (a) an experimental group who received a semantic counterconditioning of meaning treatment; or (b) a control group who were pseudodesensitized on a buffer task. Results show that snake-phobic Ss initially rated the word "snake" on the semantic differential scale as significantly negative in evaluative meaning. Ss in the experimental group showed significant alteration in their semantic differential rating of the word snake, significant decrement in their fear of snakes, and significant behavioral approach toward a live gopher snake. Semantic counterconditioning of meaning is interpreted to provide the basis for some desensitization procedures.—*Journal abstract*.

3226. **Hodgens, Timothy J.** (Boston Coll.) **An experimental study of the influence of accurate empathy on the verbal operant conditioning of verbal responses.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3708.

3228. **Kraft, T.** (St. Clement's Hosp., London, England) **Erotisierte Übertragung in der Verhaltenstherapie.** [Eroticized transference in behavior therapy.] *Zeitschrift für Psychosomatische Medizin und Psychoanalysen*, 1969(Apr), Vol. 15(2), 126-130.—States the case history of a 30-yr-old housewife who maintained her stability as long as she had both a husband and a lover. When she tried to live with her husband alone she developed phobic symptoms. In the course of behavior therapy in which the patient had to be desensitized against her fear associated with sexual intercourse with her husband and against her housebound syndrome, she developed an eroticized transference toward the therapist, substituting him for her lover. She overcame her phobic symptoms but needed additional treatment for her transference neurosis, which she found harder to overcome but did. Transference possibly explains the therapeutic effectiveness of the desensitization process.—*B. Schay*.

3229. **Krapf, Günther.** (36 Hiltenspergerstr., Munich, W. Germany) **Gedanken zum autogenen Training: Praktische Hinweise zur Zurücknahme.** [Reflections on autogenous training: Practical retraction hints.] *Praxis der Psychotherapie*, 1970(Aug), Vol. 15(4), 180-184.—Discusses the techniques of retraction taught in autogenous group training. The usual retraction involves straight arms, deep breathing, and eyes open. A variation is the Bavarian retraction, in which both arms are bent at the elbow with a simultaneous pronation and supination of the lower arms and bending and stretching of the wrists. Stretching of the legs and spinal muscles can be added; this is called the "extended autogenous form" and is comparable with the normal awakening after a good night's sleep. For falling asleep, the "walrus technique" is recommended: a slow, lazy

movement from the supine position into the customary sleeping position. The effects of interrupted retractions are discussed. After 1 or 2 wk. of group training, most patients are able to master the retraction technique. —P. von Toal.

3230. Lichtenstein, Edward. (U. Oregon) **Modification of smoking behavior: Good designs—ineffective treatments.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 163-166.—Cigarette smoking provides opportunities to investigate behavior change processes in a meaningful, naturalistic context that still permits adequate measurement and controls. Although several recent behavior modification studies, exemplified by the A. R. Marston and R. M. McFall (see PA, Vol. 46: Issue 2) paper, are well designed, the treatments employed remain ineffective. It is suggested that treatment ineffectiveness may be due to insufficient pilot (clinical) work and premature freezing of techniques into group programs. It is also argued that process studies of smoking modification must await demonstration of an outcome effect or, at the least, process variables must be shown to effect outcome. The problems involved in verifying smoking rates and whether Ss are performing the "homework" assignments frequently given by behaviorists are also discussed. (25 ref.)—*Journal abstract.*

3231. Lunde, G. E. & Vogler, R. E. (Pacific State Hosp., Pomona, Calif.) **Generalization of results in studies of aversion conditioning with alcoholics.** *Behaviour Research & Therapy*, 1970(Aug), Vol. 8(3), 313-314. "Problems of generalizing from the results of studies with inadequate S sample descriptions, lack of control groups, and insufficient follow-up are evaluated. Suggestions for change, including a scheme for characterizing the learning history of Ss, and implications for research and treatment are discussed."—A. Barclay.

3232. Marston, Albert R. & McFall, Richard M. (Psychological Research & Service Center, Los Angeles, Calif.) **Comparison of behavior modification approaches to smoking reduction.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 153-162.—Compared 2 experimental treatments for the modification of cigarette smoking with 2 control conditions, using a refined methodology for collecting daily smoking records and providing for an examination of therapist effects. 65 undergraduates served as Ss. The 1st experimental treatment employed a stimulus satiation technique in which Ss smoked 3 cigarettes on each smoking occasion. The 2nd, a hierarchy approach, involved gradual reduction beginning with the period of the day judged easiest for relinquishing cigarettes. In 1 control treatment, Ss used a pill designed to coat the mouth to make cigarettes aversive; the other control groups were instructed to quit entirely. Each of the 4 conditions showed its own characteristic reduction curve and all reduced to a mean level below 25% of base. There was a significant effect of therapist during treatment, but none at 6-mo follow-up by which time all groups had shown a considerable relapse. (15 ref.)—*Journal abstract.*

3233. Mather, Marcia D. (Warley Hosp., Brentwood, England) **The treatment of an obsessive-compulsive patient by discrimination learning and reinforcement of decision-making.** *Behaviour Research & Therapy*, 1970(Aug), Vol. 8(3), 315-318.—"The successful outcome of 1 obsessive-compulsive patient treated by 'blocking' of the compulsion and reinforcement of discrimination learning would seem to justify further investigation into the efficacy of this therapy. The

essential therapeutic variables are not established. It is not certain, for example, whether 'blocking' of the compulsive behaviour itself would have been sufficient. Meyer... successfully treated 2 obsessional by systematic prevention of the compulsive behaviour and this 'modified the expectancies' of his patients (i.e., the patient learned that the feared disasters did not occur if the compulsions were not carried out). However, in the present case (as with many other obsessionals) there seemed to be a problem of decision-making which resulted in the patient's hoarding many objects because she could not decide upon the best way of dealing with them. It is difficult to imagine that 'blocking' of rituals by itself would have abolished the hoarding response, the vacillation and the obsessional pondering. Many obsessionals do not, however, respond to systematic desensitisation. This may be because many of them have primitive fears or fears of natural disasters, which cannot be successfully avoided... and which, therefore, do not lend themselves to desensitisation. This would seem to be a further argument for removal of the compulsion supplementing the learning of an alternative response." —A. Barclay.

3234. Mausner, Bernard. (Beaver Coll.) **Some comments on the failure of behavior therapy as a technique for modifying cigarette smoking.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 167-170.—Attributes the failure of behavior therapy for smokers to 2 factors: 1st, the inadequacy of external contingencies, and 2nd, the lack of effect of aversive control. Smokers find it easy to return to smoking once they are outside the therapeutic situation. Data from a role-playing experiment are interpreted to signify that positive reinforcements for refraining from smoking might be more successful than aversive controls in changing smoking behavior. Neither of A. R. Marston and R. M. McFall's (see PA, Vol. 46 Issue 2) experimental groups showed greater reduction in smoking than their control groups. This was attributed to the weakness of aversive control for the "stimulus satiation" group which was instructed to smoke 3 cigarettes in rapid succession each time a cigarette was desired. For a "hierarchical reduction" condition in which cigarettes desired least were eliminated, it was proposed that cutting down by eliminating undesired cigarettes might strengthen rather than weaken smoking, since its rewards are, if anything, increased.—*Journal abstract.*

3235. Mira, Mary. (U. Kansas, Medical Center, Kansas City) **Results of a behavior modification training program for parents and teachers.** *Behaviour Research & Therapy*, 1970(Aug), Vol. 8(3), 309-311.—"Training parents as therapists or managers for their own children is a fairly recent development in behavior modification, one which is justified in terms of both efficiency and economy... To date, most published work in the area presents data from individual cases. The purpose of this paper is to summarize the results of a behavior modification program in which parents, and occasionally teachers, were trained to be managers for their children. The staff of the Psychology Dept. of a Children's Rehabilitation Unit conducted the program and acted as direct advisors to parents and teachers, or as trainers to doctoral students who advised parents and teachers. The emphasis was on training the managers to 1) focus on the child's behavior rather than on underlying psychopathology, 2) analyze the troublesome behavior in terms of the environmental events currently

maintaining it rather than to seek historical geneses, and 3) alter events subsequent to the behavior or to rearrange the contingencies with which consequential events were presented, rather than to develop insights into their own or their child's emotional states."—*A. Barclay.*

3236. **Prochaska, James O.** (U. Rhode Island) **Symptom and dynamic cues in the implosive treatment of test anxiety.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 133-142.—Divided 61 test-anxious college males, matched for IQ and level of test anxiety, into 5 treatment groups: (a) a symptom group given implosive therapy based on cues related symptomatically to test anxiety, (b) a dynamic group imploded with cues based on the assumed dynamics of test anxiety, (c) a general anxiety group imploded with a set of general anxiety cues assumed minimally related to test anxiety, (d) a placebo group which imagined scenes based on neutral cues, and (e) a no-treatment group. Following 3 sessions of treatment presented via tape recorders, Groups a and b improved significantly on Wonderlic intelligence scores, GPA, and reported level of anxiety on final exams, but not on the Alpert-Haber Test Anxiety Scale. Group c reported significant decreases in general anxiety as measured by Wolpe's Fear Inventory. Results support a general learning theory consonant with implosive therapy that conceives of test anxiety as being a combination of anxiety attached to both symptom and dynamic cues, and indicate that implosive therapy can be a rapid means of reducing test anxiety. (20 ref.)—*Journal abstract.*

3237. **Ramírez, Fortunato.** **La psicoterapia grupal dinámico-conductual en los alcoholistas.** [Dynamic behavioral group therapy among alcohol drinkers.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Dec), Vol. 16(4), 345-349.—Describes the use of a group therapy technique with alcoholic inpatients. The therapeutic technique is a combination of Schultz' autogenic training, Wolpe's reciprocal inhibition therapy (with a desensitization hierarchy adapted to alcoholics' problems), and a dynamic procedure aimed to strengthen ego functions.—*V. A. Colola.*

3238. **Schulze, Helmut.** (4 Maria Viktoria Str., Baden-Baden, W. Germany) **Die Aktivierung des Patienten im Kurort.** [Activating patients in spas.] *Praxis der Psychotherapie*, 1970(Aug), Vol. 15(4), 171-180.—Psychosocial and vegetative-functional factors account for 50% of all work absences in the United States and West Germany. A large percentage of patients going to spas suffer from neuroses or psychosomatic troubles. The average patient in a spa expects to be cured from his troubles with as little effort as possible through baths, massages, medicines, etc.. It is felt that to get and stay well, a man must add his own efforts. Verbal recommendations are not enough. For a successful behavior therapy, the therapist must direct his patients to new activities. 4 forms of therapeutic activity, with a gradually increasing effort of application, are recommended: play, exercise, work, and fighting. Fighting, as a maximum form of action, demands the engagement of the entire personality, including personal risks. It expresses a special type of directed behavior therapy and includes voluntary assumed responsibilities.—*P. von Toal.*

3239. **Steffy, Richard A.** (U. Waterloo, Ontario, Canada) **Trends in the development of behavior modification.** *Canada's Mental Health*, 1971(Jan), Vol. 19(1), 17-21.—Outlines the history, scope, and proce-

dures of behavior modification therapy. The definition of behavior therapies by the techniques used is considered inadequate and misleading due to the number of new techniques being developed, the difficulty in categorizing the techniques, and the lack of empirical work. It is proposed that "behavioral therapy must be identified with a clear specification of the target behavior, and an objective recording procedure to indicate variations in the frequency and intensity of the behavior that has been targeted." Assessment and treatment procedures are discussed. Various trends are outlined which include (a) a move into community services, (b) work with depression and obsessional thinking, (c) attentional training, and (d) self-instructional work.—*S. Knapp.*

3240. **Woy, John R.** (U. Rochester) **Effects of expectation on the outcome of systematic desensitization.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4351.

Special & Adjunctive Therapy

3241. **Azoubel Neto, David.** (Inst. of Dynamic Psychiatry, São Paulo, Brazil) **O valor terapêutico das atividades recreacionais no tratamento de pacientes psiquiátricos em semi-hospitalização (hospital diurno).** [The therapeutic value of recreational activities in the treatment of psychiatric patients in a day hospital.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Dec), Vol. 16(4), 341-344.—Points out the importance of recreational therapy as an auxiliary technique in the treatment of mental patients. Describes a 6-yr experience with this therapeutic procedure in a day hospital for psychiatric patients; clinical cases are presented and discussed.—*English summary.*

3242. **Gardner, Richard A.** (Columbia U., Coll. of Physicians & Surgeons) **The mutual storytelling technique: Use in the treatment of a child with neurosis.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 419-439.—Reviewed the problem of making use of information gained from storytelling in child psychotherapy. In the method described, the therapist psychodynamically interpreted the tape-recorded child's story and then retold a similar one of his own. The clinician's story was different in that he related healthier adaptations and proposed mature resolutions to the anxieties and problems originally expressed by the patient. A detailed case history of a 5½-yr-old old boy with severe posttraumatic neurosis is presented and the course of therapy is extensively reviewed. It is suggested that this type of therapy is "imaginative, constructive, and pleasure-giving."—*C. O'Donnell.*

3243. **Mallory, James D., Murphy, Daniel F., & Coppedge, Hallie.** (Highland Hosp., Asheville, N.C.) **An attitude therapy program in a teaching hospital.** *Hospital & Community Psychiatry*, 1969(Apr), Vol. 20(4), 99-102.—Attitude therapy seems to offer a good approach to treating patients from lower socioeconomic levels. "We must accept them as they are, and make our therapeutic contract on their terms by initially concentrating on the relief of symptoms." The treatment milieu should offer each patient corrective learning experiences. The team approach is used and in this case, a psychiatrist is team leader. All staff members use 5 basic attitudes: matter-of-fact, passive friendliness, no demand, kind firmness, and active friendliness. Attitude therapy was found to be "helpful in dissolving the dichotomy of

organic vs. dynamic, which inexperienced clinicians tend to see as an either/or proposition." It appeals to personnel and to the public in general. "The lack of jargon, the common-sense approach, and the clear implications for action greatly enhance its acceptance." The patient knows what the treatment goals are for him, what programs he will take part in and what some of his reactions are likely to be.—*B. A. Burkard.*

3244. **Ritvo, Miriam M., Lyons, Marie, & Howe, Margot C.** (Lesley Coll.) **Planned or haphazard change.** *American Journal of Occupational Therapy*, 1970(Sep), Vol. 24(6), 409-412.—Looks at change through the lenses of applied behavioral science. Specific attention is given to the changes that have happened and will happen to the occupational therapy profession. Emphasized is the structural change resulting from the addition of the certified therapy assistant level to the profession.—*Journal summary.*

3245. **Schenck, Jeanne.** (U. Texas, Medical Branch, Galveston) **Relevance of physical therapy issues to occupational therapy.** *American Journal of Occupational Therapy*, 1970(Sep), Vol. 24(6), 418-422.—Although dissimilarities can be identified between occupational and physical therapy, commonalities exist between the professions. These are to be found in the ultimate goals of each therapy affecting human behavior and the procedures used in physical disability. Needs and resources within the community should be identified by therapists within each specific community and plans established by the therapist for utilization of the resources in that community. A need exists for interchange of ideas, identification of commonalities, and progressive steps toward self-control and the meeting of community needs.—*Journal summary.*

3246. **Schoenberger, Leonard & Braswell, Charles.** (Delgado Coll., Rehabilitation Center) **Music therapy in rehabilitation.** *Journal of Rehabilitation*, 1971(Jan), Vol. 37(1), 30-31.—Presents a brief review of the values of music therapy in the rehabilitation process. Both group and individual forms of music therapy are discussed.—*M. A. Seidenfeld.*

3247. **Zusman, Jack.** (State U. New York, Buffalo) **A rudimentary guide to social therapies.** *Hospital & Community Psychiatry*, 1969(Feb), Vol. 20(2), 59-62.—Attempts to "specify in clinical terms some important elements of the social therapies, as a rudimentary guide for therapists." Social therapies would include, e.g., remotivation, open wards, compensated work, attitude therapy, therapeutic community, patient government, and other socioenvironmental approaches. "Social therapists have 2 serious difficulties: describing to others what they do, and explaining how what they do is effective." Rules are presented based on published descriptions of effective social therapies, sociological studies of mental illness, theories of group behavior, and studies in criminology, and on the author's personal observations.—*B. A. Burkard.*

Drug Therapy

3248. ———. **11th Annual. Psychopharmacological Conference, Jeseník, Czechoslovakia, 14-18 January 1969.** *Activitas Nervosa Superior*, 1970, Vol. 12(1), 1-96.—Presents 44 short articles reporting findings and experiments in the psychopharmacological field (octoclotheptine, fluphenazine, noviril 240, ponsital, scopolamine, centrophenoquine, triperidol with perphenazine, methylperidol with perphenazine, thiopropazate, thiothixene with perphenazine, dibenepine, hydrophthaladen, tranlycypromine, chlorimipramine, desipramine, amitriptyline, chlormezanone, sterolibrin, cycloserine, and others).—*H. Bruml.*

3249. **Ban, T. A.** (Douglas Hosp., Montreal, Quebec, Canada) **Psychopharmacology and psychiatric practice in the seventies.** *Canada's Mental Health*, 1971-(Jan), Vol. 19(1), 8-12.—Outlines the impact of psychopharmacology on psychiatric treatment, education, theory, and research. With the advent of psychotherapeutic drugs, treatment has shifted from the hospital to outpatient care based in community mental health centers. In association with this development, there are mounting pressures on psychiatric education for a shift from a psychodynamic to a social-medical approach to mental illness. Research with psychopathic and psychotherapeutic drugs has provided insight into the mechanisms and treatment of many types of disorder. Various forms of schizophrenia are distinguished by the drugs which are most effective in treatment and the underlying physiological disorder which is thus indicated. It is suggested that research within the next decade will center on 2 areas: (a) the exploration and treatment of disorders associated with the common use and abuse of drugs in everyday life, and (b) attempts to control conditioning and learning through drugs. *S. Knapp.*

3250. **Bernardini, Bino & Bruni, Dario.** (Neuropsychiatric Hosp., Volterra, Italy) **Valutazioni cliniche e psicometriche sull'impiego di un derivato delle benzodiazepine per via parenterale nelle manifestazioni depressive di psicopatolici ospedalizzati.** [Clinical and psychometrical evaluations in regard to the use of a derivative of benzodiazepine by injections in psychiatric patients' with manifestations of depression] *Rivista di Neurobiologia*, 1969(Oct), Vol. 15(4), 725-748.—Studied the effects of oxazepam, a benzodiazepine derivative, which was administered by injection to 30 hospitalized depressives. Clinical criteria and rating scales were used to control effects. It is concluded that oxazepam has the same molecular structure and the same pharmacological and clinical characteristics as other benzodiazepines, but has the advantage of not producing side effects or only slight ones. It was also found that: (a) long treatments can be continued without interruption even to the aged, (b) by administering the drug by injection, results are more rapid, (c) it indirectly aids insomnia and some aspects of depressive symptomatology, e.g., hypochondriac delirium, (d) it has a sedative action, and (e) in the area of depressive psychosis, the varieties which were most sensitive to the drug appeared, e.g., symptomatic depressions. (English summary) (3 p. ref.) *A. M. Fartaglia.*

3251. **Bruno, A. & Bruno, S. Cumer.** (P. Pini Provincial Psychiatric Inst., Milano, Italy) **Effetti dell'amitriptilina sul metabolismo delle catecolamine e della serotonina in pazienti depressi.** [Effects of amitriptyline on the metabolism of the catecholamines and of serotonin in depressed subjects] *Rivista di Neurobiologia*, 1969(Oct), Vol. 15(4), 749-761.—Studied the urinary excretions of the metabolites of norepinephrine, dopamine, and serotonin acids vanilmandelic acid (VMA), homovanillic acid (HVA), and 5-hydroxyindoleacetic acid (5-HIAA) in 10 Ss affected with neurotic or psychotic depression and treated with amitriptyline. Amitriptyline results in a decrease of VMA and an increase of HVA and 5-HIAA. However, these are slight modifications

and there was no connection between these metabolic modifications and the pharmacological effects of amitriptyline. It is concluded that any hypothesis regarding the exclusive role of noradrenalines in the antidepressive action of amitriptyline cannot be accepted without reservations. (English summary) (3 p. ref.)—A. M. Farjaglia.

3252. Ey, Henri & Bohard, François. (Psychiatric Hosp., Bonneval, France) **Résultats d'une thérapeutique médicamenteuse dans les délires chroniques: Association de la prochlorpérazine (téméntil) et de la lévomépromazine (nozinan).** [Therapy with medication in chronic deliriums and its results: Association of prochlorperazine (tementil) and of levomepromazine (nozinan).] *Evolution Psychiatrique*, 1970 (Jan), Vol. 35(1), 251-295.—Presents an experiment conducted on 100 selected patients, who were subjected to treatment with medication. The patients were divided into 5 groups: neurotics, psychotics, schizophrenics, paranoid personalities, and paranoid psychotics. Notes were made on every patient with proper background data and the type and dosage of the administered medication in each case. The best results were noted in paranoia cases, with 8 out of 13 patients showing positive results. Patients suffering from acute neurosis were the least responsive to the treatment.—I. Sirotin.

3253. Mawdsley, C. (U. Edinburgh, Scotland) **Treatment of parkinsonism with Laevo-dopa.** *British Medical Journal*, 1970 (Feb), Vol. 1(5692), 331-337.—Treated 32 patients with parkinsonism with L-dopa. 9 were markedly and 14 moderately improved. 20 patients tolerated the drug well, derived definite improvement, and were treated for an average period of 6 mo. Improvement was sustained during this period even though the average daily dosage of L-dopa was reduced. Dose dependent side-effects occurred in 25 patients. It is suggested that dosage schedules should be flexible and tailored to the needs of the individual patient, and that treatment should be continued for 6 mo. before presuming it to be ineffective. It is concluded that L-dopa often ameliorates parkinsonism for long periods, but its effect on the natural history of the disease is undetermined. (27 ref.)—*Journal abstract.*

3254. Pisani, D. & Nigro, A. (U. Messina, Medical School, Italy) **Decondizionamento aspecifico farmacologico.** [Pharmacological deconditioning.] *Rivista di Neurobiologia*, 1970 (Jul), Vol. 16(3), 329-336.—Proposed a neurophysiological theory on the pathogenesis of psychoneurosis, which includes the presence of a state of fusil hypercontrol of muscular activity. On the basis of this hypothesis a form of deconditioning is proposed which would be valid for any type of reaction. This deconditioning would be brought about through pharmacological intervention. 2 preparations should be studied: 1 which could act on the general orientation level of the organism, i.e., the condition of "living out of the past"; and the other should act toward the state of fusil hypercontrol. (English summary)—A. M. Farjaglia.

3255. Rego, A., Guimón, J., Sánchez Vega, J., & Dávila, R. (Martorell Neuropsychiatric Center, Barcelona, Spain) **Tratamiento de las psicosis crónicas y neurosis obsesivas graves con monoclór-imipramina.** [Treatment of chronic psychoses and severe obsessive neuroses with monochlorimipramine.] *Revista de Psiquiatría y Psicología Médica*, 1970 (Jan), Vol. 9(5), 340-357.—35 female inpatients were given iv, then im, and finally oral administrations of anafranil (mono-

chlorimipramine). Pre- and posttreatment ratings of behavior on the Overall and Gorham Brief Psychiatric Rating Scale showed greatest improvement in the group of 11 obsessive neurotics and the 5 patients suffering from paranoid depression. 1 case of catatony responded spectacularly, while another failed to respond. 1 case of hebephrenic schizophrenia improved slightly. Improvement in the remaining 16 patients with process schizophrenia, when present, was slight and temporary. Attention is drawn to the initial effect of anafranil to alleviate anxiety and to the good tolerance shown by patients. (English, French, & German summaries)—L. Zusne.

3256. Schnee, Jack. (American Inst. for Psychoanalysis, New York, N.Y.) **Pharmacological and dynamic factors in psychotropic drug therapy.** *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 169-177.—Describes the multiple factors to be considered in psychotropic drug treatment including (a) the pharmacology of the drug, including primary effects, side effects, and idiosyncratic sensitivity reactions; (b) the dynamics of drug therapy; and (c) the environmental effects. The significance of these in the total therapeutic situation is considered.—H. Roemmich.

3257. Seidenberg, Robert. (State U. New York, Upstate Medical Center, Syracuse) **Drug advertising and perception of mental illness.** *Mental Hygiene*, 1971 (Jan), Vol. 55(1), 21-31.—Since the advent of psychotropic drugs for the treatment of mental illness, advertisements promoting their usage have provided a great financial advantage for psychiatric and medical journals and societies, in addition to leading to the establishment of a host of drug-industry supported, gratuitously circulated, periodicals. It is contended that many of the advertisements in the above publications suggest the use of these drugs to psychiatrists as well as to other physicians as the "treatment of choice" before psychotherapy or possible social action, often for life situations and problems beyond the traditional medical and psychiatric concepts of illness or disease; this at the very time when such usage by the young and others is being roundly condemned by much of society, including organized medicine. Many of the advertisements appear to reinforce subtly, prejudices against women.—*Journal abstract.*

3258. Soullairac, A., et al. (I.N.S.E.R.M., St. Anne Psychiatric Center, Paris, France) **L'activité posturale au cours de traitements neuroleptiques: Etude expérimentale clinique, psychométrique et statokinésimétrique.** [Postural activity in the course of neuroleptic treatment: An experimental clinical study, psychometric and statokinésimetric.] *Annales Médico-Psychologiques*, 1970 (Mar), Vol. 1(3), 353-364.—The study of 8 patients under heavy neuroleptic treatment for 6 mo. permitted a test of the hypothesis that statokinésimetric and psychomotor measures would reveal infraclinical changes in postural activity. Despite an absence of defects visible on standard neurological examination and the EEG, or clinical signs that the patient group was impregnated with neuroleptic agents, a slowing was found to characterize their psychomotor movements (shown on tests of tapping, manual precision, speed, and coordination). An oculoencephalographic dissociation was also evident following visual stimulation. The reticular structures of the mesencephalon appear to be involved, the importance of which for the regulation of vigilance levels is well known. Although stato-

kinesimetric and psychomotor techniques revealed these insufficiencies clearly at a subclinical level, the question of the correlation of such changes with the efficacy of neuroleptic therapy remains open.—H. E. King.

3259. Usdin, Gene. (Touro Infirmary, New Orleans, La.) **The coin needn't smell: A response to the Seidenberg thesis.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 32-34.—In this response to an article by R. Seidenberg (see PA, Vol. 46:Issue 2) it is argued that if the charge of drug use prior to psychotherapy is true, then the "medical education system and the manufacturers" are to blame. It is agreed that some advertisements may be phony, and they may to some extent persuade as well as inform. It is concluded that it is "something to which we should continue to provide careful attention."—A. M. Cawley.

HOSPITAL CARE & INSTITUTIONALIZATION

3260. Bartz, Wayne R. (DeWitt State Hosp., Auburn, Calif.) **A small-group approach on state hospital wards.** *Hospital & Community Psychiatry*, 1970(Dec), Vol. 21(12), 390-393.—In the small-group approach, hospitalization is seen essentially as a temporary measure, and success in the ward program suggests readiness to return again to society. A program organized around 2 small groups that included from 8-13 members is discussed, and favorable follow-up data for all patients taking part in the program over a 13-mo period are reported. Several of the program's features are: Self-help and dependence upon the patient's own abilities and their group rather than upon staff members was encouraged. Ward problems were first handled by the patient groups, then by the ward nursing staff. Weekly team meetings, including a social worker, ward physician, psychologist, and the ward nursing staff were held, with the ward physician as coordinator of the team activities. Patients elected their own group chairmen and some meetings were held without staff member attendance. A mailbox and note system provided a means of communication, and the group's reactions and recommendations were returned to the staff for discussion in the staff group meetings. A level system of greater responsibility was designed to reflect a realistic life situation in a relatively simple and clear-cut format. Follow-up data showed a return rate from the small-group ward of approximately 39%, while the return rate for the other wards in the hospital was approximately 53%.—R. B. Sivley.

3261. Bigelow, Newton & Roberts, Edwin. (Marcy State Hosp., N.Y.) **The state hospital golf course.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 327-336. Discusses the essentials for organizing and developing the most impressive part of a full recreational armamentarium, the hospital golf course. It is felt that at the Marcy State Hospital patients get better care because more staff and employees are healthier and freer of tension, as are the participating patients. *Journal summary*.

3262. Blatt, Vivian M. (Lakin State Hosp., W. Va.) **VISTA workers camp with patients.** *Hospital & Community Psychiatry*, 1969(Jun), Vol. 20(6), 182-183. Focuses on a pilot camping program, in which 32 patients spent 4 days at a camp 12 miles from the hospital. The success of the 1st camp led to the establishment of a camping program in which all state establishments in West Virginia participate.—B. A. Burkard.

3263. Brice, James A. & Gonda, Harry H. (Suffolk Psychiatric Hosp., Central Islip, N.Y.) **New state hospital develops comprehensive county program.** *Hospital & Community Psychiatry*, 1969(Jan), Vol. 20(6), 184-185.

3264. Check, Frances E., Maxwell, Robert, & Weisman, Richard. (New Jersey Neuro-Psychiatric Inst., Princeton) **Carpeting the ward: An exploratory study in environmental psychiatry.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 109-118. Recently, attention has been directed toward the consequences of the physical environment of the psychiatric ward for the attainment of psychotherapeutic goals, but little progress has been made in delineating the social process variables involved. This is an exploratory study aimed at helping investigators develop basic theoretical and methodological approaches, and is concerned with the social processes associated with the introduction of carpeting to chronic wards at 2 state hospitals. 2 classes of social variables appeared relevant to the differential success of the carpeting in 2 settings: (a) what might be called "definitions of the situation," and (b) social organizational variables.—*Journal abstract*.

3265. Chimenz, B. (U. Messina, Italy) **Ruolo delle condizioni socio-familiari in rapporto alla riammissione in ospedale psichiatrico.** [Role of socio-familial conditions in relationship to readmission to psychiatric hospitals] *Neuropsychiatria*, 1968(Oct), Vol. 2(4), 909-915. Readmission to psychiatric hospital in 300 patients of a mental hygiene clinic was related to: (a) lower socioeconomic status, (b) lack of adequate treatment, and (c) poor family finances. After treatment in the mental health clinic a startling decrease in admission to the psychiatric hospital was found. (French, English, & German summaries)—L. L'Abate.

3266. Dunigan, Janeth. (Case Western Reserve U.) **Mental hospital career and family expectations.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3047-3048.

3267. Gálfi, Béla. (Health Ministry Labor Therapy Inst., Pomáz, Hungary) **Páros kapcsolatok nyitott pszichiátriai osztályon.** [Dyadic associations in open psychiatric wards] *Psychologiai Tanulmányok*, 1967, No. 10, 555-558.

3268. Goldenberg, Mauricio & Shukl, Carlos F. ("Professor G. Araoz" Alfaro Hosp., Lanús, Argentina) **Setting up a psychiatric service in a general hospital.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 85-90. Establishing a psychiatric service in a general hospital requires a 2-pronged attack on the "internal" and "external" fronts. Described in detail are the efforts made to make the service acceptable and available to other services in the hospital and to the community at large.—*Journal abstract*.

3269. Gralnick, Alexander & D'Elia, Frank. (High Point Hosp., Port Chester, N.Y.) **A psychoanalytic hospital becomes a therapeutic community.** *Hospital & Community Psychiatry*, 1969(May), Vol. 20(5), 144-146. Basic to the psychotherapeutic hospital's organization is "the belief of the administrator and the medical staff that the process of mental illness originates in a staff that the process of mental illness originates in a noxious environment and therefore may be arrested and reversed in an environment that is in harmony with the patient's real needs." The characteristics of a psychotherapeutic hospital which create its therapeutic qualities is the main focus of the article. The psychiatrist as administrator is the authority on whom all responsibility

ultimately falls. The qualifications of an effective administrator are stressed.—*B. A. Burkard.*

3270. **Grimson, Wilbur R.** (National Inst. of Mental Health, Buenos Aires, Argentina) **La transformación del hospital psiquiátrico: Una experiencia de comunidad terapéutica.** [Transformation of a psychiatric hospital: An experience of therapeutic community.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Dec), Vol. 16(4), 354-360.—Describes the reorganization of a psychiatric hospital into a therapeutic community: there was a flattening in the authoritarian hierarchy, a free flow of communication through all channels; the patients assumed several responsibilities, including care of themselves and of their sleeping quarters. Community meetings, physiotherapy, group therapy, and recreational activities were established. (16 ref.).—*V. A. Colotta.*

3271. **Hasbargen, Arthur.** (Kankakee State Hosp., Mental Retardation Div., Ill.) **Educational considerations in discharging juveniles.** *Hospital & Community Psychiatry*, 1970(Dec), Vol. 21(12), 401.—Discusses which educational factors are most needed to be considered by the staff in planning for the discharge of juveniles from a psychiatric hospital. Remedial and supportive services are likely to be needed for the majority of juvenile patients returning to community schools. Other considerations include: (a) whether or not some visual, hearing, or orthopedic problems are present; (b) behavioral and physical factors relating to classroom performance; (c) timing of the youngster's discharge; and (d) whether to communicate with the school where the youngster is to be placed. It is suggested that if the school has a psychologist, consultant psychiatrist, or clinically trained counselors or teachers, the hospital may transmit such information as the following: description of the child's behavior, intelligence level, results of other pertinent tests, nature and progress of the child's schooling in the hospital, and suggestions the school can carry out to promote the child's educational and emotional growth.—*R. B. Sivley.*

3272. **Heath, Richard M.** (Colorado State Hosp., Pueblo) **Administrative aspects of decentralization.** *Hospital & Community Psychiatry*, 1969(Apr), Vol. 20(4), 109-111.—"Most people agree that decentralization is more a philosophy than a procedure, and that many different procedures can be used effectively, once the principles have been agreed on." The advantages and problems of decentralization and some basic administrative steps that must be taken to accomplish such a major reorganization are included.—*B. A. Burkard.*

3273. **Hess, Roger N.** (Case Western Reserve U.) **Behavior change as a function of the autonomy atmosphere of the mental hospital and the patient's belief in personal control.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3707.

3274. **Hoffling, Charles K.** (St. Louis U., Medical School) **A current problem in milieu therapy.** *Hospital & Community Psychiatry*, 1969(Mar), Vol. 20(3), 78-81.—Focuses on the danger of a psychiatric hospital becoming too much like the outside world. Years ago an emotionally ill patient could behave in his confusion and desperation the way he needed to behave without alienating personnel. Modern milieu therapy must strive to recapture tolerance of deviation when it is in the interest of eventual healing.—*B. A. Burkard.*

3275. **Horn, Anna; Bóna, György, & Tarkovics, Ágnes S.** **Adatok a hospitalizáció káros hatásáról Rorschach-jegyzőkönyvek alapján.** [Data obtained from

Rorschach records concerning the injurious influence of hospitalization.] *Pszichológiai Tanulmányok*, 1967, No. 10, 809-813.

3276. **Kiss-Vámosi, József.** (Occupational Therapy Inst., Pomáz, Hungary) **Pszichiátriai osztály struktúrájának kialakítása: Autodeterminatív organizációes tömegpszichológiai hatótényezők alkalmazása.** [Structuring of a psychiatric-ward complex: Application of autodeterminative organization and mass-psychological action.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(1), 98-106.—A democratic set of rules established in a psychiatric ward proved to be effective in fighting the hospitalization syndrome. (English & Russian summaries)—*M. Moore.*

3277. **Kolb, Lawrence C.** (New York State Psychiatric Inst., New York) **Who should administer psychiatric facilities?** *Hospital & Community Psychiatry*, 1969(Jun), Vol. 20(6), 170-173.—Psychiatric training would seem to qualify a man to become the ideal professional leader. However, the psychiatrist often lacks knowledge of institutions and organizations as functioning systems, and outside manpower resources are limited. A non-medical administrator guided by a medical board is suggested. "The ultimate dilemma of who is to direct our mental health facilities will be resolved by the public."—*B. A. Burkard.*

3278. **Kraus, Robert F.** (Woman's Medical Coll. of Pennsylvania, Philadelphia) **Informal social groupings on psychiatric wards.** *Hospital & Community Psychiatry*, 1970(Jan), Vol. 21(1), 27-30.—Describes 3 recognizable subgroups of patients in a women's psychiatric ward which could be described in terms of gross behavioral, affective, psychological, and spatial referents. The "wells" were characterized by their ability to behave in a superficially normal manner. They constituted a close knit group which exercised leadership on the ward, were often angry, and denied and projected their illnesses. The "sicks" were more obviously and consistently psychotic with high levels of anxiety and low group cohesiveness. The "intermediates" had few distinctive characteristics, tending to be depressed and apathetic, utilizing withdrawal, isolation, and fantasy as defenses. Interaction of the groups is described. It is concluded that these subgroups may characterize general psychotic social behavior. Other categorizations are mentioned and theories on socially determined psychopathology discussed.—*S. Knapp.*

3279. **Linn, Lawrence S.** (U. Southern California, Medical School) **Measuring the effectiveness of mental hospitals.** *Hospital & Community Psychiatry*, 1970(Dec), Vol. 21(12), 381-386.—12 mental hospitals, located in 11 different states, provided data on 15 different characteristics including (a) release rate, (b) hospital size, (c) ward size, (d) nurses per patient, (e) attendants per patient, (f) doctors' time on ward, (g) staff-patient interaction, (h) ward atmosphere, (i) ward facilities, (j) open-door policy, (k) patient mobility, (l) smoking restrictions, (m) patients in therapy, (n) patients working, and (o) poorly-groomed patients. A matrix of rank-order correlations was created, and findings suggested that there are 2 major clusters of characteristics that seem to relate to 2 different hospital goals. Cluster 1 included the size of the hospital, the amount of staff attention to patients, and the amount of patient involvement in hospital activities; this cluster was significantly related to the rapid release of patients. Cluster 2 was less concrete, involving such factors as

hospital atmosphere, hospital facilities, and human interest policies toward patients. This cluster was not significantly related to patient release rate.—*R. B. Sivley.*

3280. Marshall, Robert J. (Lincoln Hall, Lincolnale, N.Y.) **Stages in the development of a patient government: A case study.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 303-316.—During 10 mo. of evolution of a patient council which represented 90 chronic schizophrenics, 8 stages of development were noted: conception and preparation, inception and helplessness, helplessness and activity, group identification, internal differentiation, omniscience and omnipotence crisis, turning toward reality, and loss of staff support and reorganization. Similar stages were noted in the council's approach to specific major tasks. Parallels between patients' histories and their performance in the council were noted.—*D. Prager.*

3281. Meislin, Jack. (Rockland State Hosp., Orangeburg, N.Y.) **The need for an intermediary institution.** *Hospital & Community Psychiatry*, 1969(Mar), Vol. 20(3), 88-89.—Asserts that both Veterans Administration and state hospitals should help create intermediary facilities on a regional basis. They would be for those whose underlying illness is in remission but who cannot live independently. They would offer various therapeutic, social, and vocational services, including work for pay opportunities.—*B. A. Burkard.*

3282. Nilsen, John A. (Capital District Psychiatric Center, Albany, N.Y.) **Immediate treatment expedites hospital release.** *Hospital & Community Psychiatry*, 1969(Jan), Vol. 20(1), 20-22.—The responsibility to relieve psychiatric symptoms is as binding on physicians as the responsibility to relieve physical distress. A procedure to ensure that new admissions receive prompt and intensive psychiatric treatment is described. The effectiveness of the program is shown by recent release figures. 95% of the patients were discharged, and the rate of readmission within 6 mo. was 19%.—*B. A. Burkard.*

3283. Overbaugh, Thomas E. & Bucher, Bradley. **Use of operant conditioning to improve behavior of a severely deteriorated psychotic.** *American Journal of Occupational Therapy*, 1970(Sep), Vol. 24(6), 423-427.—Attempted to determine if operant techniques could be applied to an extremely deteriorated, elderly psychotic to enable him to acquire behaviors that would aid in more effective functioning in the hospital. A behaviorally debilitated schizophrenic who was not cooperating in a token economy, on a locked ward, was removed from the system and placed upon food and cigarette deprivation. Reinforcement was provided, on a response-contingent basis, for activities appropriate for the token system. After 3 wk. of this treatment, the patient was participating fully in 3 hospital activities. A 9-mo follow-up indicated that the patient had maintained the criterion level of performance in the token system.—*Journal summary.*

3284. Pandiscio, Anna R. (Simmons Coll., School of Social Work) **A strategy for discharging long-term patients.** *Hospital & Community Psychiatry*, 1969(Feb), Vol. 20(2), 62-63.—In August 1965, a building of Boston State Hospital was chosen as the site of a night hospital, which was to be set up as part of a hospital improvement project. The building housed 7 men and 44 women inpatients, aged 17-80 who had been hospitalized 4-48 yr. They were untroublesome, in good contact, and able to care for themselves but had resisted efforts to dehospitalize them. Instead of transferring the patients,

they were moved out of the hospital itself. How the resistance of the patients, staff, and families were dealt with are described. 13 mo. after the project began, all 51 patients had left the building. Of the 41 returned to the community, 13 are living and working independently, 3 work at the hospital, 3 live with their families, 1 is in family care, 1 is in a halfway house, and 16 are in nursing homes. Of the 10 transferred to other hospital buildings, 3 were discharged through an unrelated project, and 7 remain in the hospital.—*B. A. Burkard.*

3285. Rowitz, Louis & Levy, Leo. (Illinois State Pediatric Inst., Chicago) **The state mental hospital in transition: An approach to the study of mental hospital decentralization.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 68-76.—The stages through which a mental hospital passes in the process of decentralization include (a) the development of specialized treatment programs which leads to a concern for organizational accommodation of these programs, (b) the subhospital model is adopted which divides the hospital into large program areas, and (c) decentralized hospital model or unit system.—*A. M. Cawley.*

3286. Royo, D. & Steimer, R. **Quelques aspects rétrospectifs de la morbidité psychiatrique en Suisse.** [Some retrospective views on the incidence of psychiatric diseases in Switzerland.] *Hygiène Mentale*, 1970(Jul), Vol. 59(3), 69-95. Reports results of differences observed between 1950-1954 and 1960-1964 in rates of first admission to psychiatric institutions for 11 categories of mental illnesses. Sex differences within 6 age categories are also provided. For both sexes, the frequency of admission was significantly greater in the age group 20-29 for several types of illnesses. Frequencies in admissions increased with increasing age for women but not for men. Admissions increased among adolescents and young adults in several categories but especially those related to drug abuse. *A. J. Hartman.*

3287. Schulberg, Herbert C. & Baker, Frank. (Harvard Medical School, Lab. of Community Psychiatry, Boston, Mass.) **The changing mental hospital: A progress report.** *Hospital & Community Psychiatry*, 1969(Jun), Vol. 20(6), 159-165. "Is there any evidence that the mental hospital is functioning differently, that its effectiveness has increased, that the way the community perceives it has improved, and that its relationships with other caregivers have been appropriately modified?" A progress report on a long-term project, in which these basic questions concerning the changing mental hospital are studied, is presented. *B. A. Burkard.*

3289. Silverman, Claire G. **Psychiatric ward environment and patient behavior.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3717.

3290. Spiro, Saul M. (Northern State Hosp., Sedro Woolley, Wash.) **The dual management therapy model: Theme and variations.** *Psychiatric Quarterly*, 1970(Apr), Vol. 44(2), 323-332. Describes a different form of dual management of the hospitalized mental patient. The split in management is usually between therapist and administrator. This paper focuses on a different split—between the medical and the psycho-

therapeutic approach (M/P), the latter not necessarily being a physician. This new approach is believed to facilitate the treatment of the hospitalized patient. It is suggested that the therapy-administrator split is anachronistic, confusing, and inefficient. The M/P split is efficient, efficacious, and instructive. (19 ref.)—*D. Prager.*

3291. Stanton, Duncan & Vetter, Harold J. (Florida State U.) **The mental health specialist as consultant in a chronic disease hospital.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 282-296.—Reviews some of the problems encountered by the mental health specialist who enters into a consultational relationship with the personnel in a nonpsychiatric chronic disease hospital. The mental health problems characteristically encountered in the chronic disease hospital and the general nature of such an institution are contrasted with those of the typical long-term psychiatric facility. Chronic disease hospital consultation with both individuals and groups is discussed and various instrumental aspects are related to these settings. Considerations for the design and continuation of a mental health consultation program are presented, and learning theory is suggested as a possible approach to chronic disease hospital consultation. (56 ref.)—*Journal summary.*

3292. Thompson, Lorene. (Topeka State Hosp., Kan.) **Training patients for maintenance jobs.** *Hospital & Community Psychiatry*, 1969(May), Vol. 20(5), 155.—Patient trainees are responsible for all cleaning and some repair work in assigned areas of Topeka State Hospital as part of a formal training program. The more dependent patients can gain confidence as they acquire work skills in a supportive setting.—*B. A. Burkard.*

3293. Völgyesi, Ferenc. (Péterfy Sándor Hosp., Budapest, Hungary) **A pszichés áthangolás és a stressz.** [Mental returning and stress.] *Pszichológiai Tanulmányok*, 1967, No. 10, 569-573.

3294. Wilson, Earl D. & McCulley, Charlene. (Lincoln State Hosp., Nebr.) **The use of patient-teachers in a maximum-security psychiatric unit.** *Hospital & Community Psychiatry*, 1970(Jan), Vol. 21(1), 25-26.—Describes the use of patients as teachers of other patients in a mental hospital ward in which behavior-therapy techniques had been introduced. Patients were assigned to teach the telling of time, counting, simple arithmetic, and basic reading skills to various brain damaged or retarded patients on the ward. Basic teaching aids and skills were supplied to the teacher. 2 cases are described and their benefits to both teacher and student outlined. It is concluded that the program was successful in increasing the capabilities of the students and provided meaningful activity to the teachers.—*S. Knapp.*

3295. Wilson, Wayne M. & Helm, Stanley T. (National Inst. of Mental Health, Div. of Narcotic Addiction & Drug Abuse, Chevy Chase, Md.) **An alcoholism program tailored to community needs.** *Hospital & Community Psychiatry*, 1970(Dec), Vol. 21(12), 406-408.—Suggests a comprehensive conceptualization as a promising way to deal with alcoholism and drug dependence. A demonstration program at the Mendocino State Hospital is described. In an 8-yr period, voluntary admissions rose from 600 to over 3500 a yr., suggesting that when a program is designed to meet their needs, alcoholics will seek it out. Among the problems cited was the necessity of staff members dealing with their own awareness of how they were protecting themselves against having to serve alcoholics. Their own

excuses for rejecting them, such as labeling them ineligible, describing them as unsuitable for treatment, and saying they were unmotivated had to be dealt with. At first, commitment was insisted on, but it is generally agreed now that voluntary admission is preferable. A 60-day program is carried out, with a variety of treatment modalities, e.g., family therapy, social group therapy, therapeutic community, psychodrama, behavior modification, synanon-type games, marathon sessions, and encounter groups. The treatment modality should be matched to the therapist as well as to the patient. Aftercare appointments improved from 10-95% when arrangement was made for a community social worker and an indigenous alcoholism worker to come to the hospital before a patient was released to get acquainted with him. It is further emphasized that a community mental health agency treating alcoholics cannot confine treatment to set office hours; therapists must be available during the alcoholic crisis for therapeutic intervention. Services of AA may be utilized as part of the treatment plan.—*R. B. Sivley.*

3296. Winston, Arnold & Papernik, Daniel S. (Kings County Hosp. Center, Brooklyn, N.Y.) **Establishing a therapeutic community in a municipal hospital.** *Hospital & Community Psychiatry*, 1970(Dec), Vol. 21(12), 397-400.—Describes a therapeutic community in a 19-bed, urban hospital. Staffed by 2 supervising psychiatrists, 4-6 psychiatric residents, 2 social workers, 2 psychologists, 1 secretary, and a nursing staff, the unit has, since June 1967, developed from a traditional psychiatric unit to the present therapeutic community. Regular meetings are held, with patient officers often functioning as chairmen. Both staff and patients voice their opinions and attempt to answer other patients' questions directly. Various administrative changes have taken place gradually, though staff resistance had to be overcome at some points. Also patients felt that the staff were abdicating the responsibilities and that the burden was too great for patients to assume at times. Community meetings do not replace individual or group psychotherapy, as these continue. The hospital staff feels that this program demonstrates that a municipal hospital can provide a therapeutic community and an adequate aftercare program.—*R. B. Sivley.*

PSYCHOANALYTIC INTERPRETATION

3298. Aberastury, Arminda. (Copérnico 2360, 6° "A," Buenos Aires, Argentina) **La importancia de la organización genital en la iniciación del complejo de Edipo temprano.** [The importance of genital organization in the initiation of the early Oedipus complex.] *Revista de Psicoanálisis*, 1970(Jan), Vol. 27(1), 5-25.—Develops personal views, while reevaluating and modifying those of Freud, Klein, and others, on the organization of the early genital phase, and the influence of dentition and genitality upon initiation of the Oedipus complex both in female and male infants, thus favoring the onset of heterosexuality. This early genital organization, occurring between the oral and anal phases (in the 2nd yr. of the 1st yr.), and manifested by exhibitionism, voyeurism, body exploration, masturbation, projective identification with the primal scene, and play

activity, precedes the perverse-polymorphous phase (accounting for the meaning Heimann attaches to primary anal organization), and offers a new approach to frequent disturbances occurring during the 2nd $\frac{1}{2}$ of the 1st yr. of life which had hitherto been related to orality, but which can be understood only by including the phenomenon of castration anxiety. (English & French summaries) (29 ref.)—*T. N. Webster.*

3299. **Bick, Esther.** (36 Compayne Gardens, London, England) **La experiencia de la piel en las relaciones de objeto tempranas.** [Experience of the skin in early object relations.] *Revista de Psicoanálisis*, 1970(Jan). Vol. 27(1), 111-117.—In all patients with disturbed 1st-skin formation, severe disturbance of the feeding period is indicated by analytic reconstruction, though not always observed by the parents. This faulty skin-formation produces a general fragility in later integrations and organizations. It manifests itself in states of unintegration as distinct from regression involving the most basic types of partial or total, unintegration of body, posture, motility, and corresponding functions of mind, particularly communication. The "2nd skin" phenomenon which replaces the 1st-skin integration, manifests itself as either partial or total type of muscularity. Analytic investigation of the 2nd-skin phenomenon tends to produce transitory states of unintegration. Only an analysis which perseveres to thorough working-through of the primal dependence on the maternal object can strengthen this underlying fragility. It must be stressed that the containing aspect of the analytic situation resides especially in the setting and is therefore an area where firmness of technique is crucial. (French summary)—*English summary.*

3300. **Goldstein, Raquel Z.** (Peña 2452, 6°, "12." Buenos Aires, Argentina) **Demian: El mito de la latencia y la adolescencia: Versión literaria del tratamiento psicoanalítico del autor.** ["Demian": The myth of latency and adolescence: Literary version of the author's psychoanalytic treatment.] *Revista de Psicoanálisis*, 1970(Jan), Vol. 27(1), 119-140.—Discusses the way in which Herman Hesse, in *Demian*, unconsciously gave a literary version of his own analytic treatment. To that purpose, this study deals with an analysis of the novel and the function it performed for its author. Certain problems inherent in the passage from latency into adolescence are noted. The obstacles are discussed which Sinclair, the main character, faces in order to achieve an adequate maturity, which is replaced by the idealization of a narcissistic homosexual attachment, with incestuous, masturbatory, and thanatic contents. It is suggested that the novel is in the nature of a resistance, an acting out of Hesse's ongoing analytic treatment, which he symbolizes with different models. Hesse develops an ideology designed to institutionalize homosexuality and narcissism through an attempt to seduce the reader. (French summary)—*English summary.*

3301. **Hermann, Imre.** **Újabb adatok a magyar lélektan történetéhez: Alom és álommagyarázat a régi magyar irodalomban.** [New contributions to the history of Hungarian psychology: Dream and dream interpretation in old Hungarian literature.] *Magyar Pszichológiai Szemle*, 1969, Vol. 26(3-4), 459-461.—Describes dreams reported in 18th century Hungarian literature along with relevant quotations from medical texts of the same period.—*M. Moore.*

3302. **Kaufmann, Pierre.** (U. Nanterre, School of Letters & Humane Sciences, France) **La théorie freudi-**

enne de la culture. [The Freudian theory of culture.] *Bulletin de Psychologie*, 1969 1970, Vol. 23(9 10), 549-559.—Describes the development of social values, ethics, and mores from the viewpoint of Freudian theory.—*R. E. Smith.*

3303. **Laplanche, J.** **La sexualité: I-IV.** [Sexuality: I-IV.] *Bulletin de Psychologie*, 1969 1970, Vol. 23(9 10), 489-501, 591-603.—Presents 4 lectures on sexuality from the Freudian point of view. Freud's cases of Anna O. and Elizabeth are discussed.—*R. E. Smith.*

3304. **Laplanche, J.** **La sexualité: V.** [Sexuality: V.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(11-12), 683-687.—Presents the 5th in a series of lectures on sexuality from the Freudian viewpoint. Childhood "seduction," the Oedipus complex, the primal scene, and similar concepts are discussed.—*R. E. Smith.*

3305. **Moulton, Ruth.** (William Alanson White Inst., New York, N.Y.) **A survey and reevaluation of the concept of penis envy.** *Contemporary Psychoanalysis*, 1970(Fal), Vol. 7(1), 84-104.—Surveys the theories of Freud, Horney, Josine Muller, Carl Muller-Brown, Schweig, Greenacre, Kestenberg, Dooley, Mary Jane Sherfey, Melanie Klein, Lorand, and Clara Thompson on penis envy. Suggestion is made that penis envy as an "evanescent phase" may occur with little girls' awareness of its existence, is part of childhood curiosity, and may be transitory if the role as a girl is satisfying. No significant conflict will result if healthy growth ensues. However, under certain circumstances secondary reinforcing factors which may have importance in a later neurotic problem may appear such as sibling rivalry, deep dependency needs for the mother, or disappointment at the hands of a rejecting or remote father. Accepting this approach leads to reevaluation of other assumptions, e.g., that acceptance of passivity and masochism is essential for healthy femininity, the need to change erotic zones, etc. 2 case presentations illustrate this viewpoint. (29 ref.)—*M. J. Stanford.*

3306. **Schwidder, Werner.** (Nieders. Landes-Krankenhaus, Tiefenbrunn/Göttingen, W. Germany) **Vorträge der 20. Lindauer psychotherapiewoche: Regression als Abwehrphänomen.** [Lectures given at the 20th psychotherapy week in Lindau: Regression as a protective phenomenon.] *Praxis der Psychotherapie*, 1970(Aug), Vol. 15(4), 145-150.—Discusses the correlations between regression and fixation. The significance of the concept of regression as a protective phenomenon is stressed in modern psychoanalytic literature by von Viebahn and Kuiper. An earlier study discussed the fact that the protection mechanisms are reactions to inhibited impulse expressions. A case study is presented of a patient who had suffered since early childhood from feelings of neglect, rejection, and isolation, with phases of regression to the early oral state, with an autoerotic object relation. As an outgrowth of the protection mechanism, further sequences appeared which provided points of departure for therapeutic application. It is shown that regression, just as any other protection phenomenon, is embedded in complicated neuroconstructural contexts.—*P. von Toal.*

PSYCHODIAGNOSIS

3307. **Apostal, Robert A.** (U. North Dakota, Dept. of Counseling & Guidance) **Personality descriptions of mental health center patients for use as pre-therapy information.** *Mental Hygiene*, 1971(Jan), Vol. 55(1),

119-120.—Based on a study of 66 terminated patients whose folders contained results of MMPI testing, profile analyses were made for men and for women, to be submitted as pretherapy personality descriptions.—A. M. Cawley.

3308. Brunell, Shirl. (U. Houston) **Measurement of conceptual deficit in brain-damaged and schizophrenic subjects.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4328-4329.

3309. Buckham, H. F. **The Group Personality Projective Test: An Australian application.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 153-154.—Administered the Group Personality Projective Test (GPPT) to 31 delinquent Australian Army soldiers and compared results to a previously reported sample of 430 delinquent or imprisoned individuals from the United States. Analysis of performance reveals that the Australian sample scored significantly higher on the Tension scale, and significantly lower on the Neuroticism and Affiliation scales than the United States sample. Total scores, as well as scores on the Nurturance, Withdrawal, and Succorance scales did not differ between the 2 samples. The high Tension scales of the Australian sample were suggested to be a consequence of testing the day after court-martial; lower Neuroticism and Affiliation scores were attributed to cultural differences. It is concluded that "the results in general indicate an applicability of the GPPT to Australian delinquents and further studies on other populations could prove profitable."—R. Wiltz.

3310. Conforto, C., Giberti, F., Menduni, G., & Seminara, B. (U. Genoa, Italy) **Rilevati sull'applicazione ambulatoriale del MMPI.** [Comments of the application of the MMPI on an outpatient basis.] *Neuropsychiatria*, 1968(Oct), Vol. 24(4), 763-778.—Out of 124 MMPI profiles, a small percentage was invalid. A significant agreement was found between psychometric and clinical diagnosis, especially in psychotic patients. However, such an agreement decreased in the diagnosis of borderline and neurotic patients. The profiles of depressed patients are discussed.—L. L'Abate.

3311. Davis, Kenneth R. & Sines, Jacob O. (Willmar State Hosp.) **An antisocial behavior pattern associated with a specific MMPI profile.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 229-234.—Describes a narrowly defined MMPI profile and the behavior pattern associated with it in a state hospital, a state prison, and a university medical center. The MMPI 4-3 profile pattern, with the psychopathic deviate and hysteria scales elevated in a particular configuration, entailed a behavior pattern that includes hostile-aggressive acting out. The hostile-aggressive behavior pattern characterized most of the 60 male Ss with this MMPI profile in each of 3 settings studied. The frequency of this profile pattern and the social and psychological importance of the behavior pattern associated with it suggest that clinical investigators can profitably study this group of Ss. The method used to establish the relationship between this particular MMPI profile and the hostile-aggressive behavior pattern is recommended for more general use.—*Journal abstract.*

3312. Enachescu, Constantin. ("Pr Dr G. Marinescu" Hosp., Psychiatric Section of Bălăceanca, Bucharest, Romania) **Analyse psychopathologique des rêves et des états oniro-hallucinatoires dans la peinture des malades mentaux.** [Psychopathological analysis of dreams and oniro-hallucinatory states by drawings of the mentally ill.] *Annales Médico-Psychologiques*, 1970(Feb),

Vol. 1(2), 185-232.—Dreams of psychopathological Ss offer a useful aid to diagnosis and can help to guide a program of therapy. Neurotic dreams have been well-studied, but comparatively little attention has been given to the dreams of psychotic patients, although they offer in pure form (no entry of reality) a glimpse of the troubled intrapsychic state. Drawings made of dreams by patients suffering with toxic psychoses, psychoneuroses and psychoses reveal a nosologic specificity. They differ fundamentally from similar productions made by healthy individuals. Despite the obstacle that such reports must be derived from patients with a disturbed waking state, they are superior to merely verbal reports of thought content and relationships obtained by the usual interview. Sample drawings and their psychopathological analyses are offered for schizophrenic, depressive, toxic-psychoneurotic, and other psychopathological conditions.—H. E. King.

3313. Ernhart, Claire B. (U. Missouri, St. Louis) **The Peabody Picture Vocabulary Test: Automated application in a statewide psychiatric system.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 317-320.—The Peabody Picture Vocabulary Test (PPVT) is easily and quickly administered by trained subprofessional personnel and is quite acceptable to most patients. The PPVT correlated .86 with the Full Scale IQ scores of the WAIS.—D. Prager.

3314. Fagiani, M. B. & Ravizza, L. (U. Turin, Inst. of Clinical Psychiatry, Italy) **Il test di Rorschach negli etilisti.** [The Rorschach test of alcoholics.] *Neuropsychiatria*, 1968(Oct), Vol. 24(4), 741-761.—Chronic alcoholics displayed little ability to formulate abstract thoughts. Superficial thinking predominated over affectivity. The latter was characterized by inhibition, immaturity, lability, and egocentricity. Fantasy was the defense most used to escape feelings of inferiority. (French, English, & German summaries) (18 ref.)—L. L'Abate.

3315. Fleiss, Joseph L., Lawlor, William; Platman, Stanley R., & Fieve, Ronald R. (New York State Dept. of Mental Hygiene, Biometrics Research, New York, N.Y.) **On the use of inverted factor analysis for generating typologies.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 127-132.—Inverted, or Q-, factor analysis has been 1 of the most frequently employed methods in numerical typology. Its application to a sample of 52 manic-depressives using data from a battery of tests, including the MMPI and structured clinical interview, yielded 5 types which seemed to make clinical sense. Examination of the data, however, pointed to the existence of just 1 type of depressives and either 1 or 2 types of manics. It is concluded that the data must be examined for heterogeneity before an exercise in numerical typology is undertaken. If the univariate and multivariate distributions on all variables for a sample are unimodal and symmetric, then the sample is most likely homogeneous as far as the variables employed are concerned, and it would be hard to justify using the given data for generating types. If the data suggest the existence of types, then a method other than inverted factor analysis might better be used to find them. Some problems in validating numerically derived typologies are discussed. (25 ref.)—*Journal abstract.*

3316. Graham, John R. (Kent State U.) **Feedback and accuracy of clinical judgments from the MMPI.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 286-291.—21 judges from each of 3 clinical

experience levels judged 90 MMPI profiles as being either neurotic or psychotic. Judges receiving feedback after each trial achieved a higher accuracy rate than judges receiving no feedback. Although experience level was not significant as a main effect, the differences among feedback groups were greatest for the more experienced judges. Accuracy increased as a function of number of trials, but the greatest accuracy achieved by any group of judges after 90 trials was 72%. Several possible reasons for the low accuracy rates are suggested. (24 ref.)—*Journal abstract.*

BEHAVIOR DISORDER

3327. György, Júlia. (Eötvös Lóránd U., Budapest, Hungary) **Az antiszociális állapotok okairól, patomechanizmusáról és strukturális sajátosságairól.** [On the causes, pathomechanisms and structural characteristics of antisocial states.] *Pszichológiai Tanulmányok*, 1967, No. 10, 717-725.

3328. Halleck, Seymour. (Wisconsin Div. of Corrections, Madison) **Stimulus/response: You can go to hell with style.** *Psychology Today*, 1969(Nov), Vol. 3(6), 16, 70-73. The "stylist" is a new form of behavioral disorder found among college students who focus on style without content. Frequently the stylist demands immediate relevance and easily becomes bored. He seldom possesses any depth of interest in activities which would permit a beginning of a rectification of the problems he diagnoses so well. This disorder is partially caused by society's emphasis on immediacy and by current uncertainties about the future.—L. J. Posner.

3329. Jenkins, Richard L. (U. Iowa) **Typen von Verhaltensstörungen bei Kindern.** [Types of children's behavior disturbances.] *Aerzenztz*, 1969(May), Vol. 40(5), 197-203. Discusses the relationship of 6 symptomatic types of children's behavior to characteristic family situations. The overanxious type is usually found in educated middle-class families, where high goals of success are stressed. These children feel that their acceptance depends on their reaching high goals. The withdrawing type is found where life does not offer enough satisfaction. Parents appear to such children to be strange, uninteresting, and inclined to mete out hard punishments. The hyperkinetic type is the usual result of slightly diffused brain damage. The unsocially-aggressive type results from the rejection of a child by his parents who may also, however, be overprotective. Runaway children suffer, as a rule, from a direct rejection from their parents. A delinquent group reaction is usually the result of group rebellion of young people due to lack of parental supervision. Problems of treating such children are discussed. (18 ref.)—P. von Foel.

Drug Addiction

3331. Jaffe, Jerome. (U. Chicago, Pritzker Medical School) **Whatever turns you off.** *Psychology Today*, 1970(May), Vol. 3(12), 42-44, 60-62. Since it is likely that drug users have heterogeneous motivations for taking drugs, a multimodal approach to drug abuse taking drugs, a multimodal approach to drug abuse would be useful. Major current methods include (a) drug substitution programs such as methadone maintenance, (b) prevention of narcotic action by an antagonist drug such as cyclazocine, (c) compulsory

119-120.—Based on a study of 66 terminated patients whose folders contained results of MMPI testing, profile analyses were made for men and for women, to be submitted as pretherapy personality descriptions.—*A. M. Cawley.*

3308. Brunell, Shirl. (U. Houston) **Measurement of conceptual deficit in brain-damaged and schizophrenic subjects.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4328-4329.

3309. Buckham, H. F. **The Group Personality Projective Test: An Australian application.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 153-154.—Administered the Group Personality Projective Test (GPPT) to 31 delinquent Australian Army soldiers and compared results to a previously reported sample of 430 delinquent or imprisoned individuals from the United States. Analysis of performance reveals that the Australian sample scored significantly higher on the Tension scale, and significantly lower on the Neuroticism and Affiliation scales than the United States sample. Total scores, as well as scores on the Nurturance, Withdrawal, and Succorance scales did not differ between the 2 samples. The high Tension scales of the Australian sample were suggested to be a consequence of testing the day after court-martial; lower Neuroticism and Affiliation scores were attributed to cultural differences. It is concluded that "the results in general indicate an applicability of the GPPT to Australian delinquents and further studies on other populations could prove profitable."—*R. Wiltz.*

3310. Conforto, C., Ghiberti, F., Menduni, G., & Seminara, B. (U. Genoa, Italy) **Rilevi sull'applicazione ambulatoriale del MMPI.** [Comments of the application of the MMPI on an outpatient basis.] *Neuropsychiatria*, 1968(Oct), Vol. 24(4), 763-778.—Out of 124 MMPI profiles, a small percentage was invalid. A significant agreement was found between psychometric and clinical diagnosis, especially in psychotic patients. However, such an agreement decreased in the diagnosis of borderline and neurotic patients. The profiles of depressed patients are discussed.—*L. L'Abate.*

3311. Davis, Kenneth R. & Sines, Jacob O. (Willmar State Hosp.) **An antisocial behavior pattern associated with a specific MMPI profile.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 229-234.—Describes a narrowly defined MMPI profile and the behavior pattern associated with it in a state hospital, a state prison, and a university medical center. The MMPI 4-3 profile pattern, with the psychopathic deviate and hysteria scales elevated in a particular configuration, entailed a behavior pattern that includes hostile-aggressive acting out. The hostile-aggressive behavior pattern characterized most of the 60 male Ss with this MMPI profile in each of 3 settings studied. The frequency of this profile pattern and the social and psychological importance of the behavior pattern associated with it suggest that clinical investigators can profitably study this group of Ss. The method used to establish the relationship between this particular MMPI profile and the hostile-aggressive behavior pattern is recommended for more general use.—*Journal abstract.*

3312. Enachescu, Constantin. ("Pr Dr G. Marinescu" Hosp., Psychiatric Section of Bălăceanca, Bucharest, Romania) **Analyse psychopathologique des rêves et des états oniro-hallucinatoires dans la peinture des malades mentaux.** [Psychopathological analysis of dreams and oniro-hallucinatory states by drawings of the mentally ill.] *Annales Médico-Psychologiques*, 1970(Feb),

Vol. 11(2), 185-232. Dreams of psychopathological Ss offer a useful aid to diagnosis and can help to guide a program of therapy. Neurotic dreams have been well-studied, but comparatively little attention has been given to the dreams of psychotic patients although they offer in pure form (no entry of reality) a glimpse of the troubled intrapsychic state. Drawings made of dreams by patients suffering with toxic psychoses, psychoneuroses, and psychoses reveal a nosologic specificity. They differ fundamentally from similar productions made by healthy individuals. Despite the obstacle that such reports must be derived from patients with a disturbed waking state, they are superior to merely verbal reports of thought content and relationships obtained by the usual interview. Sample drawings and their psychopathological analyses are offered for schizophrenic, depressive, toxic-psychoneurotic, and other psychopathological conditions.—*H. E. King.*

Drug Addiction

3331. Jaffe, Jerome. (U. Chicago, Pritzker Medical School) **Whatever turns you off.** *Psychology Today*, 1970(May), Vol. 3(12), 42-44, 60-62.—Since it is likely that drug users have heterogeneous motivations for taking drugs, a multimodal approach to drug abuse treatment programs such as methadone maintenance, (b) prevention of narcotic action by an antagonist drug such as cyclazocine, (c) compulsory

institutional treatment, and (d) half-way houses run by ex-addicts. This diversity can be traced to differences in opinion about the causes of addiction. However, all have some validity. The author was instrumental in starting a treatment program in which all methods are used so that patients may find the approach which is best for them.—E. J. Posavac.

3332. McDermott, Raphael. **Maintaining the methadone patient: A study of 20 narcotic addicts and their families provides clues to the problems they faced while in a methadone maintenance program.** *Nursing Outlook*, 1970(Dec), Vol. 18(12), 22-26.—Interviewed 20 selected patients on a methadone regime in their homes to ascertain whether they were adjusting to treatment. Since previous epidemiological inquiries had sorted out narcotic history and family background, the interviewer, a public health nurse, concentrated on the current family situation. A wide variety of physiological responses were exhibited and physical and attitudinal extremes manifested. It is suggested that (a) wives of patients on a methadone regimen can be a stabilizing force and lend much support to their husbands; (b) recreation is an important factor in the patient's rehabilitation; and (c) while the methadone program offers protection against readdiction to heroin, there are diversified problems which former addicts encounter in rehabilitating themselves.—S. Diamond.

3333. Rosenthal, Mitchell S. & Biase, D. Vincent. (Addiction Services Agency, New York, N.Y.) **Phoenix houses: Therapeutic communities for drug addicts.** *Hospital & Community Psychiatry*, 1969(Jan), Vol. 20(1), 26-30.—Addicts come into the program through 12 neighborhood storefront units called Phoenix Centers which are manned by former addicts. Encouragement and counseling plus group therapy, called "encounters," are offered. "Candidates for Phoenix House programs usually spend from 1-3 mo. in a center program while they break the drug habit." Treatment at 1 of the 8 Phoenix Houses usually takes 12-18 mo. after which the person is transferred to 1 of 2 Phoenix Reentry Houses for 6-12 mo. for the final phases of social and vocational rehabilitation. The Phoenix Houses are 4 or 5 story tenements which have been renovated by Phoenix House work crews. They are located in neighborhoods that have high rates of drug abuse. Encounters are an important element of the treatment program, as are the work and educational programs.—B. A. Burkard.

Experimental pathology in animals indicates that these lesions are formed in the hypothalamic and thalamic regions. On the basis of what is already known about anatomical and functional relationships, the importance of sexuality in alcoholics is studied as well as amorous behavior pattern. Jealousy in love plays a part in the instincts of human beings in the socio-cultural evolution of our race. On a psychopathological level, it is considered an abnormality in amorous behavior. The lesion could represent a motive of interference for the liberation of instinctive behavioral designs, which explains the constant existence of jealousy in the alcoholic occurring with hypothalamic and thalamic lesions. 3346. Martínez Pardo, F. **El deterioro intelectual en la intoxicación etílica crónica.** [Intellectual deterioration in chronic alcoholic intoxication.] *Archivos de Neurobiología*, 1970(Jul), Vol. 33(3), 273-279.—Hypothesized that alcoholic deterioration possesses features distinguishing it from general organic deterioration, or schizophrenic or thymic deterioration. The WAIS was administered to 33 30-59 yr. old male alcoholics, recently admitted to a psychiatric hospital (using Wechsler's formula to calculate deterioration). Results indicate that 12 Ss had certain deterioration; 10, possible deterioration; 4, insignificant deterioration; and 7, no deterioration. Scatter and patterns revealed discrepancies between alcoholic and organic deterioration (but not extreme negative deviation in the code and Kohs block subtests). It is concluded that during intoxication the alcoholic's pattern is practically the same as that of the organic brain syndrome, but after withdrawal the pattern varies with reversibility of the deterioration (psychomotor coordination almost completely recovering its normal state). The subtest that showed the most profound and uniform negative deviation was that of immediate memory of numbers, therefore considered to be the most efficient for distinguishing alcoholic deterioration from other types. 3347. McGee, Richard K. (U. Florida, Coll. of Health Related Professions) **Suicide prevention programs and mental health associations.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 60-67.—Examined and evaluated the activities of mental health associations in 2 states over a 5-yr period. Conclusions indicate that mental health associations are the most appropriate agencies to initiate suicide prevention programs, should as quickly as possible turn them over to other administrative bodies to maintain and support, and should refrain from any continuing management relationship over the program.—*A. M. Cawley.*

3348. Raphling, David L. (5225 Connecticut Ave., Washington, D.C.) **Dreams and suicide attempts.** *Journal of Nervous & Mental Disease*, 1970(Dec), Vol. 151(6), 404-410.—Compared the manifest content of dreams of patients who had attempted suicide with the manifest content of nonsuicidal (but seriously disturbed) patients' dreams. Themes of death, violence, and destruction were found significantly more often ($p < .01$) in the dreams of the suicidal patients. The presence of these themes did not appear to be related to the seriousness of patients' suicide attempts. (35 ref.)—*R. A. Denis.*

3349. Seiden, Richard H. (U. California, Berkeley) **We're driving young blacks to suicide.** *Psychology Today*, 1970(Aug), Vol. 4(3), 24-28.—While overall suicide rates of Negroes is lower than that for whites, young Negroes (ages 15-24) commit suicide at a higher rate than whites. If victim-precipitated homicides are considered suicides, then the young, male Negro suicide rate soars. 2 cases are presented to illustrate how an explosive masculine rage can serve to end life while still exhibiting the norms of the ghetto. The behavior of Black Panthers bears many similarities to the behavior of people precipitating their own murders. Life in the urban ghetto is such that this kind of behavior is foreseeable and indicates that "the nation is in bad trouble."—*E. J. Posavac.*

3350. Siegmund, Georg. (28 Abt-Richard-Str., Fulda-Nevenberg, W. Germany) **Die Frage nach dem Krankheitscharakter des Selbstmordes.** [Type-of-illness problems of suicide.] *Praxis der Psychotherapie*, 1970(Apr), Vol. 15(2), 70-81.—Zilboorg stated in 1936 that suicide was not "antimoral", but an illness, comparable with tuberculosis, an idea expressed already by Goethe in his "Werther" in 1774. Based on data obtained from modern psychiatric practice, it is shown that the percentage of suicidal psychotics is low compared with other cases. Schultze points out, however, that all depressive and schizophrenic types have suicidal tendencies. Findings of this study indicate that suicide is committed mainly out of feelings of inner emptiness, uncertainty, lack of essential goals, and conflict. It is stressed that the percentage of young people committing or attempting suicide is very high, and that suicide may appear as an escape. As a preventive, a task or mission in life is recommended to give life a true value.—*P. von Toal.*

3351. Tabachnick, Norman & Klugman, David. (Los Angeles Suicide Prevention Center, Calif.) **Anonymous suicidal telephone calls: A research critique.** *Psychiatry, Washington, D.C.*, 1970(Nov), Vol. 33(4), 526-532.—In a 1965 study N. Tabachnick and D. Klugman (see PA, Vol. 39:10621) reported on a group of callers to a suicide center who refused to give their names. In a later study by J. Wilkins (see PA, Vol. 44:16936), a replication in another suicide center, none of the conclusions of the 1st study were supported. Problems of method and research replication are discussed. Large scale follow-up studies are in progress and may answer some of the problems.—*E. M. Uprichard.*

Crime

3352. Beit-Hallahmi, Benjamin. (Michigan State U.) **Aggressive and sexual fantasies in violent and non-violent prison inmates.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4353.

3354. Eysenck, Sybil G. & Eysenck, H. J. (U. London, Inst. of Psychiatry, England) **Crime and personality: An empirical study of the three-factor theory.** *British Journal of Criminology*, 1970(Jul), Vol. 10(3), 225-239.—Tested the prediction that prisoners would differ from normal controls with respect to 3 personality variables: psychoticism, extroversion, and neuroticism. 603 male prisoners were tested and compared with 3 control groups, consisting of 534 married men, 423 students, and 185 unmarried industrial apprentices. It was considered that no single group presented a good match for the prisoners, but that results from 3 such diverse control groups would throw more light on the personality differences hypothesized. Results strongly supported the hypothesis that prisoners would have higher Neuroticism scores, and only weakly supported the hypothesis that prisoners would have higher Extroversion Scale scores. It was argued that the smallness of the differences observed with respect to extroversion might not necessarily invalidate the hypothesis under investigation, and reasons were adduced why questionnaire measurements of extroversion in prisoners might present unusual difficulties.—*R. Gunter.*

3355. Ferracuti, Franco. (U. Rome, Law School, Italy) **Criminal violence.** *Bolettino di Psicologia Applicata*, 1970(Feb), No. 97-99, 33-39.—Illustrates some reasons why psychological approaches to the study of criminal violence have not succeeded. Violence is an interdisciplinary field, yet few interdisciplinary concepts can be found in the literature of violence. 2 problems emerge when behavioral scientists and legal scholars attempt cross communication: (a) In the field of law, the variety of concepts makes common concepts difficult. For the behavioral scientist, the object of the search is for general truths, irrespective of legal variations, although they are aware of social and cultural differences. (b) There is difficulty in comparing legal and behavioral definitions of psychopathological violence. An additional problem is which acts should criminal violence cover. Other reasons for skepticism about studying criminal violence are the "separatist myth," the tendency in criminological research to consider criminal behavior as unique and separate from other forms of behavior; and the "correlational fallacy," the attempt to find something different about criminals. (16 ref.)—*A. M. Farfaglia*.

3356. Jensen, Diana E., Prandoni, Jogues R., & Abudabbeh, Nuha N. (D.C. Public Health, Legal Psychiatric Services, Washington) **Figure drawings by sex offenders and a random sample of offenders.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 295-300.—Tested the relationship between the Draw-a-Person Test (DAP) and sexual pathology. Drawings by 53 sex offenders were compared with drawings by 63 nonsexual offenders randomly chosen from the clinic files. Drawings were compared for overall quality on a special scale, and presence or absence of signs often considered indicative of sexual disturbance. There were no significant differences between the drawings of the random sample and the drawings of sex offenders. It is concluded that the measures used were poor indicators of sexual disturbance and were not sensitive to sexual pathology in this sample. (15 ref.)—*Journal abstract*.

3358. Persons, Roy W. & Marks, Philip A. (Ohio State U.) **The violent 4-3 MMPI personality type.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 189-196.—Attempted to replicate and extend the study of K. R. Davis and J. O. Sines (see PA, Vol. 46:Issue 2) which found the MMPI high point pattern of 4-3 to be associated with commission of violent acts. 48 4-3 male inmates were compared with the 3 most frequently occurring other MMPI code types in a prison and with the institutional base rate for commission of violent criminal offenses. 4-3 Ss committed significantly more violent acts than any of the other personality groups and significantly more violence than the base rates of inmates in general. The other 3 personality groups did not differ from the base rate. Of the 4-3 Ss, 85% had a history of violence. Personality variables, e.g., guilt and anxiety, and race of the offender, are discussed. (24 ref.)—*Journal abstract*.

3359. Rotenberg, Mordechai & Sarbin, Theodore R. (Hebrew U., Jerusalem, Israel) **Impact of differentially significant others on role involvement: An experiment with prison social types.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 97-107.—Exam-

ined whether prison social-type behavior is congruent with self or is a function of the significance of different audiences, and assessed the degree of involvement in different roles in the presence of different audiences. 40 adult male prisoners were assigned to 3 experimental and 1 audience group. Results show that (a) when fellow inmates served as audience, the typical prisoner "con" role was rated higher in involvement; (b) when social welfare students comprised the audience, the social worker's role was rated higher in involvement; and (c) involvement in the custodial officer role before a custodian audience was not rated higher. When Ss were classified according to social type, the rated involvement in prisoner roles was congruent with the expectations for each social type. Prison social-type behavior is interpreted as a situational response to specific primary deprivations influenced by the degree of significance of specific audiences. (51 ref.)—*Journal abstract*.

Juvenile Delinquency

3360. Bapp, Fred B. & Blazer, John A. (Ft. Worth State Mental Health Clinic, Tex.) **Social characteristics of recidivist and non-recidivist male delinquents.** *Psychology*, 1970(Nov), Vol. 7(4), 67-81.—Attempted "to determine whether differences exist in the 20 social characteristics displayed by each of 2 groups of adjudicated delinquent boys seen for counseling. . . ." 2 random samples were comprised of a recidivist group of 93, and a nonrecidivist group of 234. A schedule of 20 demographic items based on the Court Delinquency Report was constructed. Each item was tested for significance of the difference by chi-square. Findings support the significance of the following items: custody of the child, age, and the counselor's personal evaluation of the child's character. (24 ref.)—*S. Knapp*.

3362. Crews, Norma C. (U. Oklahoma) **An assessment of the perceptions of life and attitudes toward school orientation of juvenile delinquents living in detention.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2758-2759.

3363. Davis, Glenn C. & Brehm, Mary L. (Duke U.) **Juvenile prisoners: Motivational factors in drug use.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 333-334.—3 distinct groups of juvenile prisoners were studied by means of an attitude questionnaire, MMPI, a drug-use inventory, and social history data. A group composed of narcotic law violators was shown to differ from other drug-using as well as non-drug-using criminals on various personality characteristics. Responses on attitude factors corresponded to differentiation of the groups in terms of drug-use patterns. MMPI profiles for all groups were similar and generally typical of juvenile delinquents.—*Author abstract*.

3364. Deitz, George E. (Ohio State U.) **The development of self-concept during adolescence and its relationship to adjustment.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4306-4307.

3365. Dubeck, John A., Schuck, Solomon Z., & Cymbalisty, Bohdan Y. (State Home for Boys, Jamesburg, N.J.) **Falsification of the forced-choice guilt**

Inventory. *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 296.—Administered D. Mosher's Forced-Choice Guilt Inventory (FCGI) to 70 male adjudicated delinquents. All Ss took the test under standard instructions and then under "fake bad" and "fake good" instructions. Results were significantly different under the 3 conditions. Ss had high guilt scores under the good condition and low scores under the bad. Standard condition scores were not highly related to the other scores. The difference in scores in the bad and good conditions was significantly related to IQ, indicating that only brighter Ss could fake successfully on the test. It is concluded that the FCGI is a useful research tool, but that caution must be exercised in evaluation when used as a diagnostic tool.—S. Knapp.

3367. Kole, Delbert M. & Busse, Howard. (Oregon Regional Medical Program, Portland) **Trail camping for delinquents.** *Hospital & Community Psychiatry*, 1969-(May), Vol. 20(5), 150-153.—Describes Youth Adventures, a voluntary organization incorporated to provide programs and facilities to combat juvenile delinquency in Oregon. Last summer 8 groups of 20-40 teen-age boys and girls were taken on wk. long camping trips. Principles effective in reshaping delinquent behavior, e.g., exposure to nondelinquent models, intense small-group interaction, immediate rewards and punishments, and mutual interdependence are performed.—B. A. Burkard.

3368. Kolos, Tamás. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **A fiatalkori kriminalitás és a dadogás néhány összefüggése: Előzetes közlemény.** [Some correlations of juvenile delinquency and stammering.] *Pszichológiai Tanulmányok*, 1967, No. 10, 707-710.

3369. Krauss, Herbert H., Coddington, R. Dean, & Smeltzer, Donald J. (U. Georgia) **Ethical risk sensitivity of adolescents in legal difficulty: First contact and repeat contact groups.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 213-217. The ethical risk sensitivity of 46 adolescents confined for evaluation and disposition for the 1st time by an agency of the juvenile court was compared to a group of 39 adolescents who had been to this center previously and were returned. While no difference was noted between the 2 groups in sensitivity to reinforcement value of censure, 1 component of ethical risk sensitivity, the 1st-timers were more attentive to expectation of gain than were the repeaters. Results are thought to be attributable to differences which existed in the 2 groups prior to their admission to the center.—Author abstract.

3370. Majláth, György. (Medical U. of Budapest, Hungary) **Az igazságügyi pszichológiai szakértői tevékenység néhány kérdése fiatalkorúak büntetőügyeiben.** [Problems to be faced in jurisprudence by the psychological expert in causes of juvenile crime.] *Pszichológiai Tanulmányok*, 1967, No. 10, 711-715.

3371. Stein, Kenneth B., Sarbin, Theodore R., & Kulik, James A. (U. California, Berkeley) **Further validation of antisocial personality types.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 177-182.—Describes more fully the 7 delinquent per-

sonality types previously derived by J. Kulik, K. Stein, and T. Sarbin (see PA, Vol. 42:17429). Personality types were based on the scores of 346 institutionalized delinquent boys on 4 dimensions: delinquent role, drug usage, parental defiance, and assaultiveness. Validation was tested in relation to 5 classes of psychological and social variables: family relations, verbal and intellectual achievement, self-acceptance, delinquency, and miscellaneous. A 3-yr follow-up of police records as a measure of recidivism was included. Significant findings were utilized as definitional characteristics in describing each of the 7 types. Several general findings emerged: (a) a combination of typological pattern and magnitude of dimensional scores rather than either factor alone was a better predictor of future recidivism; and (b) among milder delinquent types, race may be operating as a bias in determining incarceration. Future research on the problem of discovering differential methods of intervention and behavior change in relation to the 7 types is discussed. (17 ref.)—Journal abstract.

3372. Velez-Diaz, Angel & Mcgarree, Edwin J. (Veterans Administration Hosp., San Juan, P.R.) **An investigation of differences in value judgments between youthful offenders and nonoffenders in Puerto Rico.** *Journal of Criminal Law, Criminology & Police Science*, 1970(Dec), Vol. 61(4), 549-553.—To determine if differences in criminality, social class, educational level, language, or cultural background might influence such ratings. Puerto Rican offenders and nonoffenders rated the seriousness of the same 141 criminal offenses rated by Sellin and Wolfgang in Pennsylvania. There were few significant differences, a high degree of agreement and a similarity between the mean, with no differences in variability which might be expected if 1 group was manifesting greater value confusion. The implications of these findings for popular theories of delinquency are discussed.—R. Gunter.

Homosexuality & Sexual Deviation

3374. Klimmer, R. **Annoncen in einer Zeitschrift für Homosexuelle.** [Advertisements in a magazine for homosexuals.] *Nervenarzt*, 1969(Jan), Vol. 40(6), 212-275.—Homosexuals, especially those living in the country or small town, often have difficulties in finding suitable sexual partners. Therefore, many of them place want ads in magazines catering to homosexuals. In this respect, Denmark is an open country. Advertisements for partners or friends taken from a magazine published in Copenhagen are analyzed according to nationality, body characteristics, interest and hobbies of the advertisers, and of the partners desired. Psychiatric and somatic interests as well as occupation of the partner involved are discussed and critically analyzed. P. von Tsch. 3375. Lopez, Thomas W. (Boston U. Graduate School) **Emotional expression in the adult sex offender.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3709-3710.

3376. Petri, H. (Free U. Psychiatric & Neurologic Clinic, Berlin, W. Germany) **Exhibitionismus: Theoretische und soziale Aspekte und die Behandlung mit Antandrogenen.** [Exhibitionism: Theoretical and social aspects and treatment with antiandrogens.] *Nervenarzt*,

1969(May), Vol. 40(5), 220-228.—Outlines aspects of exhibitionism in its psychological complexities and social consequences, with the purpose of showing that this perversion should be treated as a disease and not as a crime, thus creating preconditions for an intensive therapeutic treatment. It is believed that the symptoms of exhibitionism are an expression of structural distortions, including aggressive and sexual drives, conflicts, and inhibitions. Among therapeutic methods, the necessity of psychotherapeutic group work is stressed. The recently introduced treatment with antiandrogens is described. Possibilities and advantages of a combined therapy with hormonal, psychotherapeutically oriented, and social-psychiatric means are outlined. (35 ref.)—*P. von Toal*.

MENTAL DISORDER

3378. ———. **C.S.F. protein in psychiatric disorders.** *British Medical Journal*, 1970(Mar), Vol. 1(5696), 582.—Reviews a study by R. Hunter, M. Jones, and A. Malleon, on the relationship between an abnormally high level of protein in the cerebrospinal fluid and psychiatric disorders. No definite conclusion on the relationship between specific psychiatric pictures and specific pathological processes is drawn.—*S. R. Diamond*.

3379. Anepetu, L., Bria, P., & Mazza, S. (Catholic U., Clinic for Nervous & Mental Diseases, Rome, Italy) **Analisi antropofenomenologica di un'esperienza in una istituzione manicomiale del Meridione.** [An antropofenomenological analysis of an experience in a southern psychiatric institution.] *Archivio de Psicologia Neurologia e Psichiatria*, 1970(Jul), Vol. 31(4), 363-386.—The acute physical and psychological alienation and discomfort of patients in a psychiatric hospital in southern Italy are related to structural patterns in the family and the society of southern Italy. Goffman's work is cited. (French, English, & German summaries)—*L. L'Abate*.

3380. Behrman, Joan & Levy, R. (Middlesex Hosp. Medical School, London, England) **Neurophysiological studies on patients with hysterical disturbances of vision.** *Journal of Psychosomatic Research*, 1970(Jun), Vol. 14(2), 187-194.—Studied the tubular or spiral visual fields of 14 patients with reduced vision in whom organic disease was excluded to determine if neurophysiological techniques such as the recording of cortical evoked potentials provide a new means of investigating hysterical conversion reactions. Visual evoked responses were recorded in each patient to low intensity light stimuli under conditions of dark adaptation. The normal dark adapted final threshold obtained in this way was compared with the abnormal threshold recorded on the standard dark adaptation curve found in most patients. The significance of the results are discussed. (30 ref.)—*W. G. Shipman*.

3381. Biryukov, P. V. (Ed.) **Problemy psikhiiatrii: Endogennyye psikhozy.** [Problems in psychiatry: Endogenous psychoses.] Kiev, USSR: Zdorov'ya, 1970. 232 p. 1 R. 69 K.—Investigated endogenous psychoses, mainly schizophrenia, manic-depressive psychosis, and epilepsy. The following factors were considered: (a) types and

syndromes of schizophrenia and other psychoses encountered in clinico-experimental practice; (b) pathophysiology of higher nervous activity; and (c) endogenous psychoses and connected disturbances of somatic processes, e.g., metabolism. 3 types of schizophrenic state of mind are established: pseudooligophrenic, apathetic-hyponic, and apathetic-dissociative. Schizophrenic defectology, schizophrenia in its terminal phase, circular schizophrenia, and differential diagnosis of hypochondriacal schizophrenia underwent a special analysis. Epilepsy, manic-depressive psychosis, and arterosclerotic state of mind were similarly examined. Formation of temporary connections and the interrelationship of stimulating systems was studied in psychiatric patients and compared with normals. A method was developed to determine the type of higher nervous activity characteristic of each mental disease being analyzed. The metabolism of substances, e.g., tryptophan and amino acids, was investigated and the disturbances found were examined.—*I. Halev*.

3382. Bloch, R. **Zur Stellung der Monomanien und Süchte in der speziellen Psychiatrie.** [Reflections on the place of monomanias and addictions in special psychiatry.] *Nervenarzt*, 1969(Jan), Vol. 40(1), 28-32.—Compares and defines the concepts of "monomania" and "addiction," and the histories of these concepts, which have often been substituted for each other, are given. As a difference, it is noted that, while an addicted person is anxious to withdraw from unpleasant realities (e.g., an alcoholic), a monomaniac strives to strengthen his position among his fellow men and dares to challenge his environment. With an addiction, the wishes of the id for protection against a sense of discomfort and for a reduction of irritations predominate, while monomanias, integrated in the ego, are characterized by expansive strivings for superiority. For the latter, the term of "egomanias" is introduced; they clearly serve for the attainment of egoistic interests. It is suggested that the vague concept of monomania should only be used as a historical term. An affinity for an addiction is found with asthenic-depressive personalities, while an affinity for egomaniacal actions is found with sthenic-paranoid personalities. (20 ref.)—*P. von Toal*.

3383. Cheek, Frances E. & Wolcott, Roy. (New Jersey Neuro-Psychiatric Inst., Princeton) **Hospitalized disturbed children: Demographic, family background and behavioral characteristics.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 349-370.—Burdock and Hardesty Children's Behavior Inventory was filled out for 336 children by ward staff who knew them well. Demographic and background data confirmed some previous findings and amplified others. Brain-damaged children showed higher scores on Incongruous Behavior and Lethargy-Dejection. Psychotics and children with behavioral disturbances were higher on Anger-Hostility, Fear and Worry, Conceptual Dysfunction, and Physical Complaints. There were significant differences between male and female mentally ill adolescents and adults. (22 ref.)—*D. Prager*.

3384. Chesteen, Hilliard; Bergeron, Veronica, & Addison, William P. (Louisiana State U.) **Geographical mobility and mental disorder.** *Hospital & Community Psychiatry*, 1970(Jan), Vol. 21(1), 31-32.—Reexamined the relationship of geographical mobility and mental disorder in 326 patients. Contrary to previous findings, an inverse relationship between the factors was found. Whereas the United States Census Bureau reported a

national mobility rate of 20% for the year of the study, 57% of the patients had never moved, and only 4% averaged 1 move/yr. It is suggested that in the present society mobility has become a positive value and that the inability to move may represent emotional problems, that the person who stays in 1 place too long may lose touch with reality.—S. Knapp.

3385. Ey, Henri. (Psychiatric Hosp., Bonneval, France) **La dissolution de la conscience dans le sommeil et le rêve et ses rapports avec la psychopathologie: Esquisse d'une théorie de la relativité généralisée de la désorganisation de l'être conscient et des diverses maladies mentales.** [The dissolution of consciousness in sleep and dream state and its relation to psychopathology: Outline of a theory of generalized relativity of the disorganization of consciousness and various mental disorders.] *Evolution Psychiatrique*, 1970(Jan), Vol. 35(1), 1-37.—Theorizes that dreams are rooted in sleep and that mental illnesses can be related to the forms of dreams, basing this on theory that fantasies are developed by the conscious. These fantasies are used as a common denominator for the sleep-dream phenomena and it is stipulated that the difference between various forms of mental disorders and dreams in relation to normality is attributed to the forms of fantasies developed in the conscious surroundings. Sleep is considered as a negative structure and dreams as a positive one, enabling the psychiatrist to narrow down the sleep-dream patterns generated by the subconscious. A conscious being is defined and what this definition entails is explained.—I. Sirotnin.

3387. Kayton, Robert & Biller, Henry B. (Prince George's County Mental Health Center, Cheverly, Md.) **Perception of parental sex-role behavior and psychopathology in adult males.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 235-237.—Studied matched groups of 20 normal, neurotic, paranoid schizophrenic, and nonparanoid schizophrenic adult males. Perception of parental sex-role behavior was measured by Heilbrun's Parental Description Survey in which Ss judge whether certain characteristics are more typical of their mother or father. Results indicate that normal Ss generally perceived their parents as exhibiting sex-appropriate behaviors to a greater extent than did disturbed Ss. A smaller proportion of disturbed Ss viewed their fathers as possessing masculine-instrumental traits, and, particularly among the schizophrenic groups, their mothers as having feminine-expressive characteristics.—*Journal abstract*.

3388. Kupfer, David J., Wyatt, Richard J., & Snyder, Frederick. (Yale U., Medical School) **Comparison between electroencephalographic and systematic nursing observations of sleep in psychiatric patients.** *Journal of Nervous & Mental Disease*, 1970(Dec), Vol. 151(6), 361-368.—Compared 2 sleep measurements. Vol. 151(6), 361-368.—The measurements were in agreement with high reliability for patients diagnosed as schizophrenic, but poor agreement was obtained for depressed patients. Possible explanations and implications of using the observational method in sleep research are discussed. (23 ref.)—R. A. Denis.

3389. Loch, Wolfgang. (Tübingen U., Nervenlinik,

W. Germany) **Seelische Ursachen psychischer Störungen: Versuch einer Systematik.** [Emotional-mental causes of psychic disturbances: An attempt at a systematic presentation. I.] *Praxis der Psychotherapie*, 1970(Apr), Vol. 15(2), 49-59.—Discusses proximal causes which consist of certain events to which a person gives a definite meaning. As causes of dispositions, which are considered to be psychosocial developmental products, periphrastic and cumulative dreams are discussed. The substantial character of emotional-mental disturbances is mainly caused by the fact that experiences are screened from consciousness by defense mechanisms and thus from further intersubjective communication. Mental abnormalities appear where, due to defense mechanisms, the symbolic action is cut off from any further development, so that symbolic distortions and faulty interpretations are formed, thus limiting or excluding the capacity of learning from experience.—P. von Toal.

3390. Loch, Wolfgang. (Universitäts-Nervenklinik, Tübingen, W. Germany) **Seelische Ursachen psychischer Störungen: Versuch einer Systematik.** [Emotional-mental causes of psychic disturbances. An attempt at a systematic presentation. II.] *Praxis der Psychotherapie*, 1970(Jun), Vol. 15(3), 97-107.—Explains disposition as an expression of physical structure and its dynamics, with psychic trauma considered to be the primary cause. It is concluded that the emotional-mental causes discussed are based on 3 fundamental assumptions: (a) that emotional-mental life is characterized by sense and meaning identified with the emotional-mental life itself; (b) that the symbol-creating function is a basic characteristic of the emotional-mental life; and (c) that the creating and processing of the emotional-mental experiences takes place in a highly differentiated exchange between conscious and unconscious issues. The 1st are determined by the law of primary processes, and the 2nd by the law of secondary processes. (2 p. ref.)—P. von Toal.

3391. Malmö, Robert B. (U. Montreal, Allan Memorial Inst. of Psychiatry, Quebec, Canada) **Emotions and muscle tension: The story of Anne.** *Psychology Today*, 1970(Mar), Vol. 3(10), 64-67, 83.—EMGs have proved useful in therapeutic settings because the EMG can detect otherwise unobservable reactions to stimuli such as sound and pain. Even patients with severe hysterical symptoms do not initially inhibit the control mechanisms which produce muscle tension. Conversely, EMGs show that patients with chronic anxiety reactions lack an adequate regulatory mechanism to bring muscle tension back to normal levels after strong stimuli. Combining EMG measurement with learning techniques may result in training procedures permitting patients to control their muscle tension.—E. J. Posavac.

3392. Naylor, G. J., McNamee, H. B., & Moody, J. P. (U. Dundee, Scotland) **Erythrocyte sodium and potassium in depressive illness.** *Journal of Psychosomatic Research*, 1970(Jun), Vol. 14(2), 173-177.—"The erythrocyte sodium potassium concentrations were determined in 26 female patients suffering from a depressive illness, and in 12 female controls." The mean erythrocyte sodium concentration of the patients was significantly lower than that of the control group. The patient group was subdivided by diagnostic scales into 11 psychotics and 15 neurotics. No difference between the psychotic group and the controls was shown. The erythrocyte sodium concentration of the neurotic group

was significantly lower than that of the control and the psychotic group. "After correction for age, there was no significant difference in erythrocyte potassium concentration between any of the groups."—*W. G. Shipman.*

3393. Naylor, G. J., McNamee, H. B., & Moody, J. P. (U. Dundee, Scotland) **The plasma control of erythrocyte sodium and potassium metabolism in depressive illness.** *Journal of Psychosomatic Research*, 1970(Jun), Vol. 14(2), 179-186.—The erythrocyte transport of sodium and potassium in an artificial electrolyte was determined in 24 female patients suffering from a severe depressive illness to determine if active and passive erythrocyte transport of Na and K between patients classified as neurotic and psychotic are due to the intrinsic state of the erythrocytes or to plasma factors. The results showed that there was no change in the active or passive erythrocyte transport of the psychotics with recovery, and that the active and passive erythrocyte transport of sodium increased with recovery in the neurotics. The erythrocyte sodium permeability of both groups when depressed and recovered was lower than that of the control groups. The active erythrocyte transport of sodium was lower in the psychotics than in the neurotics. (15 ref.)—*W. G. Shipman.*

3394. Pirozynski, T. (Spitalul Socola Iasi, Psychiatric Clinic, Jassy, Romania) **La signification onto-analytique de la motivation dans les syndromes psychiques réactionnels.** [The onto-analytic significance of motivation in psychic reaction syndromes.] *Annales Médico-Psychologiques*, 1970(Mar), Vol. 1(3), 365-373.—Abnormal "psychic reactions" (i.e., disturbed behavior following a dramatic existential situation, such as a death or disappointment in love or work) provide a subject for study not only by clinical psychiatry but bear on our understanding of group interpersonal relations generally. Reactional problems derive from an interaction of stressful external events, usually social, with particularities of the individual personality structure. Neurophysiologic models describe this as faulty homeostasis, while biologic explanations regard it as a disruption in the rhythm of functions. The dynamic concept of stress leads to a more motivational mechanism, by which pathological psychic reactions are understood as stages of dissolution in the psychic life of the individual, reflected in his social behavior. Examining the subjective content of the psychological decompensation permits an observation of the nature of the conflict between event and structure, and a tracing out of the latter is determined by ontologic development of the personality.—*H. E. King.*

3396. Stegner, Paul F. (Washington State U.) **An investigation of the internality-externality attitude dimension in a psychiatric patient population.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3717.

3397. Stolorow, Robert D. (Postgraduate Center for Mental Health, New York, N.Y.) **Mythic consonance and dissonance in the vicissitudes of transference.** *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 178-179.—Studied fantasy productions of Ss manifesting obsessive vs. hysterical personality traits. Statistically significant differences were found in "personal myths" between the 2 groups. Results indicate that the obsessive

personality tends to attribute causative powers to his own volitional acts, while the hysteric attributes causative powers to external forces. The dynamics in the treatment of these 2 types are discussed.—*H. Roemmich.*

3398. Wieser, Stefan. (Municipal Nerve Clinic, Bremen, W. Germany) **Aspekte des paranoiden Mechanismus.** [Aspects of the paranoid mechanism.] *Nervenarzt*, 1969(Mar), Vol. 40(3), 101-106.—Discusses the psychopathology of paranoia and examines a form of the delusion which occurs exclusively in human interaction. Persons suffering from this condition may be aggressive or sensitive paranoids who see their own shortcomings confirmed in the behavior of their environment. This is illustrated by the case of a paraphrenic 42-yr-old housewife. The subjective conviction of being different, of deviating from certain standards, is found at the beginning of paranoia. As a direct result, the person develops delusions of persecution. For the group the paranoid is a problem carrier who disturbs its established order, and the initially 1-sided process later becomes reciprocal. It is suggested that there is no conclusive evidence that delusion has an organic-cerebral substrate, as was believed 20 yr. ago, but that paranoid behavior is based on a normal, omnipresent, psychological regulatory process. The paranoid deviance of a person induces the group to apply mostly negative sanctions against him and decrease interaction, both of which increase his paranoid behavior and lead to his isolation. (17 ref.)—*B. Schay.*

3399. Zuger, Bernard. (New York U., Medical School) **Self-consciousness considered within a theory of self.** *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 135-144.—Attempts to place various manifestations of self-consciousness within a theory of self. These manifestations are discussed with reference to the young individual and to patients with neuroses, with obsessive-compulsive phobic symptomatology, and with depression. A theory of self to accommodate expressions of self-consciousness is thought to be constructed along a configurational model in which consciousness is the "figure" for the "ground" constituted by the rest of the organism. Applied to intra-organismal functioning, the terms "awareness" and "being" are used. In this sense, it is hypothesized that normally there is a gradual decrease in self-consciousness as the individual's identification with being increases.—*H. Roemmich.*

3410. Montanari, A. J. (Montanari Residential Treatment Center, Hialeah, Fla.) **A community-based residential program for disturbed children.** *Hospital & Community Psychiatry*, 1969(Apr), Vol. 20(4), 103-108.—The Montanari Clinical Center was founded in 1952 with 3 paying students and now has 220 children living in 17 ranch-style homes scattered throughout several blocks in the heart of Hialeah's residential area. The children (4-20 yr. old) have been characterized as children who have great difficulty in controlling their impulses, in learning, and in getting along socially. "The community setting is particularly important to our basic goal of social education." Flexibility, stability, and informality are integral parts of the environment. In the educational program, classes consist of occupational therapy as well as regular academic subjects. Family counseling is an important part of the program. 1 of the basic goals is to provide treatment as economically as possible.—B. A. Burkard.

3411. Paci, A. & Freddi, A. (S. Maria Hosp., Terni, Italy) **In tema di enuresi ed encopresi.** [On the subject of enuresis and encopresis.] *Rivista di Neurobiologia*, 1969(Oct), Vol. 15(4), 835-848. Studied the difference between urinary incontinence and enuresis which is a complex neuropsychic syndrome. Existing analogies between the 2 syndromes are studied extending the criteria of etiopathogenic univocity to disturbances of the psychomotility (tics and stuttering). 6 recordings of EEG are reported with emphasis on the great percentage of irritative type traces. The use of antiepileptic drugs is suggested in the treatment of the 2 syndromes. (French summary) (31 ref.)—A. M. Faraglia.

(Albert Einstein Coll. of Medicine, Yeshiva U.) **"What kind of fool am I?": A study of popular songs in the analysis of a male hysteric.** *Psychiatry, Washington, D.C.*, 1970(Nov), Vol. 33(4), 516-525.—Describes the occurrence of fragments of popular songs during the analysis of a 30-yr-old male.

The patient was able to communicate emotions through song titles that were difficult to verbalize.—E. M. Uprichard.

3415. Szinetár, Ernő. (Joseph Attila Hosp., Budapest, Hungary) **Neurózist okozó konfliktusok tipológizálási kísérlete.** [A typological approach of conflicts causing neurosis.] *Pszichológiai Tanulmányok*, 1967, No. 10, 541-546.

3416. Volkan, Vamik. (U. Virginia Hosp.) **Typical findings in pathological grief.** *Psychiatric Quarterly*, 1970(Apr), Vol. 44(2), 231-250.—Patients exhibiting pathological grief reactions are those in the middle portion of a spectrum between those on 1 end who suffer from full-blown neurosis, psychosomatic symptoms, etc., which are directly related to a known loss. After examining 23 cases, it is suggested that patients who suffer from pathological grief share a relatively predictable symptomatology. The typical symptoms and signs, as well as typical events in the case histories of such patients, are described. (30 ref.)—*Journal summary.*

3417. Volmat, R., Allers, G., Vittouris, N., & Dufay, F. (U. Besançon, Neurological & Psychiatric Clinic, France) **Statut actuel clinique et thérapeutique de l'anorexie mentale.** [The current clinical and therapeutic status of anorexia nervosa.] *Annales Médico-Psychologiques*, 1970(Feb), Vol. 1(2), 161-184.—Presents a description and historical summary of extreme feeding disorders of psychogenic origin, with examples of incidence and treatment drawn from current practice. These young patients, although usually adolescent and female, vary from 12-37 yr. in age and include several men. The refusal of food, associated with pubertal sexual awakening and fear of abandonment, is qualitative (selective) at first; becoming quantitative later with severe weight loss and possible cachexia. 13 cases are described to illustrate the important factors of family conflict, triggering events, treatment methods, and the importance of aftercare following hospital discharge. Diagnosis is easy and symptom treatment consists of isolation of the patient (20-40 days), supported by psychotherapy and the use of psychoactive drugs. Special diets are not important. Anorexia is considered a symptom not an autonomous disease, and the underlying psychogenesis must always be evaluated carefully for each patient.—H. E. King.

Psychosis

3418. Blankenburg, W. (U. Freiburg, Psychiatric & Neuro-Clinic, W. Germany) **Zur Leistungsstruktur bei chronischen endogenen Psychosen.** [Efficiency structure with chronic endogenous psychoses.] *Nervenarzt*, 1970(Dec), Vol. 41(12), 577-587.—Recognition of rehabilitation chances of patients suffering from chronic endogenous psychosyndromes demands precision concerning the changed structure of their efficiency. Besides, the background of their efficiency will have to be considered, as well as its structure and integration. The manner in which mental, social, and physical failures interlock is emphasized. Besides the course of the psychosis and the actual situation factors, the premonitory coining of the patient's attitude in facing himself and the world is of considerable importance, especially his primary life anchorage in the world. With endogenous depressive and schizophrenic types, certain polar structures stand out. These structures are sketched and examined with the purpose of ascertaining how far they

can serve for a reintegration into the processes of working in the "outside" world. (1 p. ref.)—*P. von Toul*

3419. **Braceland, Francis J.** (Inst. of Living, Hartford, Conn.) **Changes in the treatment of involuntional melancholia.** *Hospital & Community Psychiatry*, 1969 (May), Vol. 20(5), 136-140.—In the 1930s, the treatment of involuntional melancholia left a great deal to be desired. Drugs, mainly barbiturates, were employed. Other forms of treatment were continuous tubs, rehabilitation through "moral treatment," and narcosis therapy. These patients had a 50% chance of getting well and a 25% chance of destroying themselves. Endocrine replacement therapy was fashionable. In the mid-1930s insulin shock therapy was introduced but it did little for involuntional melancholia. With the advent of ECT in 1938, a form of treatment specific for depressions was found. The prognosis changed from a 50% recovery rate and a 25% suicide rate to a recovery rate of nearly 100%.—*B. A. Burkard*

3420. **Brunstetter, R. W.** (U. California, Medical School, San Francisco) **Every day on an inpatient ward for psychotic children.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 203-217.—In focusing on emotional support, gratification, and learning as its primary goals, the program in essence is providing what is needed for normal growth and development. When these goals are pursued with care and precision, the ward milieu in its most effective form is a framework of activities and opportunities which supports the psychotherapeutic task of conflict reduction and aids the psychiatric nurse with the daily functioning of the psychotic child. *Journal summary*.

3421. **MacVaugh, Gilbert S.** (U. Mississippi) **A comparison of the effects of cost and reward token reinforcement methods on the behavior of long-term mental hospital patients.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3732.

3422. **Olson, E. H.** (Outagamie County Hosp., Appleton, Wis.) **A social rehabilitation program in a county hospital.** *Hospital & Community Psychiatry*, 1969(Jun), Vol. 20(6), 173-174. Describes the limitations of the prerelease program to patients with psychotic disorders who the staff feel need special preparation before discharge. A special unit with room for 8 women and 5 men and supervised by a resident housemother was set aside for this purpose. The development of individual responsibility and the ability to form new interpersonal relationships are the main goals. Off-grounds activities are encouraged and medications are self-administered. After the resident has worked full time to the unit with a mean of 10 yr. 2 mo. hospitalization, and they spent an average of 5 yr. mo. in the program, 7 were returned to the wards, 16 were discharged, and 14 of them are still living out of the hospital.—*B. A. Burkard*

3423. **Polez, Alain.** **A bábjáték alkalmazása felnőtt elmebetegeknél.** [Psychodiagnostics and complex therapeutic application of puppet-show in adult psychotics.] *Psychologiai Tanulmányok*, 1967, No. 10, 769-776.

3424. **Rohrl, Vivian J.** (San Diego State Coll.) **A nutritional factor in windigo psychosis.** *American Anthropologist*, 1970(Feb), Vol. 72(1), 97-101.—Reviews reports of windigo psychosis, particularly those cases which are cured before they become full-blown, and

studies evidence for an organic factor related to the development of the illness. Knowledge of biological factors related to ritual behavior in different cultures is reviewed in this context, together with examples of windigo cases and relevant information about treatment. It is indicated that the traditional cure of windigo symptoms, which frequently includes the ingestion of fatty meat, particularly bear meat, may reflect the result of long-term, not necessarily conscious, empirical observation by Chippewa and other northern Algonquian peoples. (19 ref.) *Journal summary*

3426. **Weadland, K. L. & Ahlswede, J.** (U. Kiel, Psychiatric Clinic, W. Germany) **Verlaufs-kontrollen bei phasischen Psychosen.** [Control of the course of phasic psychoses.] *Nervenarzt*, 1970(Sep), Vol. 41(9), 434-439.—Studied 206 patients suffering from phasic psychoses, based on their histories, in order to ascertain whether the aspects of the disease in their various phases are similar or whether important differences occur. The following essential results were obtained: The difference between cycloid psychoses in anxiety-happiness psychoses, excitement-inhibition confusion, and hyperkinetic-akinetik-motility psychoses is most difficult to diagnose in individual cases at the outset, as the symptoms of these 3 psychoses appear often to be combined and crossed. In longer multiphase courses, the aspects of the various cycloid psychoses can alternate. With the same patient, there are found various manic-depressive aspects of his disease pertaining cycloid aspects. The same holds true in paranoid anxiety psychoses. With phasic psychoses, a trend toward cycloid forms as well as toward pure depression in the sense used by Leonhard seems to be the larger, the stronger the schizothymic aspects are with the patient in question. (20 ref.)—*P. von Toul*

Schizophrenia

3428. **Allon, Richard.** (Case Western Reserve U.) **Sex, race, social class and process-reactive schizophrenia ratings.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4323.

3429. **Arata, A.** (Provincial Psychiatric Hosp., Genoa, Italy) **Osservazioni sulla classificazione di Leonhard in tema di schizofrenia: Rilievi su 70 lungodegenti.** [Observations on the classification by Leonhard in the subject of schizophrenia: Notes on 70 long-term patients.] *Neuropsychiatria*, 1969, Vol. 1(4), 527-541. A classification of 70 long-term schizophrenics according to the criteria set by Leonhard (1958) is questioned the validity of his classificatory scheme. (29 ref.) *E. L. Olson*

3430. **Beck, Samuel J., Sunnally, J. C., & Rine, Donald A.** (Chicago) **Attitudes of schizophrenic children about parents and others in their environments: A semantic differential study.** *Psychiatric Quarterly*, 1970(Apr), Vol. 44(2), 251-270.—Measured the judgments of schizophrenic children in respect to 16

concepts, using 14 scales. The internal environment necessary for the development of the psychopathology was investigated. Other studies report the effects of the external environment, the family, and society at large. There are different impacts of environment on children growing up, no matter how similar this environment may seem. The states of mind measured in the present study were learned. A person is not born with a need to be sad, cold, lazy, or hostile. Another optimistic conclusion in regard to psychotherapy is that learned attitudes can be unlearned. (15 ref.)—*D. Prager.*

3431. **Benedetti, Gustav.** *Dynamische Rollen der schizophrenen Spaltung.* [Dynamic functions of the schizophrenic split personality.] *Praxis der Psychotherapie*, 1970(Oct), Vol. 15(5), 194-200.—One of the fundamental objectives of perceptive psychiatry, e.g., psychiatry with a dynamic approach, is to examine the abnormal psychic phenomena to determine how much they reflect human norms, although distorted, which man cannot do without even in psychosis. The psychically abnormal can teach us about the "other" face of life. 3 examples of schizophrenic patients show how repressed or seemingly lost insight is manifested by dissociation. In all cases the schizophrenic patient looked at himself with the split-off side representing his insight into the real nature of the conflict. What the patient can no longer accomplish by self-reflection is realized by him in the structure of contradiction of his psychotic existence.—*B. Schay.*

3432. **Billig, Otto.** (Vanderbilt U., Medical School) *Structures of schizophrenic forms of expression.* *Psychiatric Quarterly*, 1970(Apr), Vol. 44(2), 187-222.—When schizophrenic patients become aware of their inability to express themselves verbally, they may begin to draw and paint to make themselves understood. Disintegration of the ego boundaries are correlated with the spatial structure in the drawings. Reintegration of spatial structure is seen in paintings of recovering schizophrenics. Basic changes of spatial structure are seen to be similar regardless of cultural background. (26 ref.)—*D. Prager.*

3433. **Bleuler, Manfred.** (Inst. of Psychiatry, Zurich, Switzerland) *Some results of research in schizophrenia.* *Behavioral Science*, 1970(May), Vol. 15(3), 211-219.—Presents the text of a lecture outlining results of research in the history, influences, and role of physical damage in schizophrenia. Results of a 20-yr study of 208 schizophrenics and their families are emphasized. Diagnostic criteria and the typical course of the disease are described. No 1 specific form of therapy is considered correct. Results of the 20-yr study indicate that appropriate therapy can prevent the most severe forms of schizophrenia and improve all schizophrenic conditions. With therapy, "episodic courses with good intermissions are becoming more frequent, and chronic psychoses with constant hospitalization, rarer." However, the number of full recoveries has not increased, and the number of severe chronic psychoses has not diminished. In studies of the nature and genesis of schizophrenia, no single cause was found. Results of endocrine, psychodynamic, and hereditary studies are described. It is concluded that "the background of schizophrenia consists in both disharmonic, contradictory inborn dispositions in the development of personality, and disharmonic, contradictory human relationships." Studies of the children of schizophrenics found nearly 75% to be healthy. A selected bibliography is presented. (45 ref.)—*S. Knapp.*

3434. **Bürger-Prinz, H. & Schorsch, E.** (U. Hamburg, Psychiatric & Neuropathic Clinic, W. Germany) *Anmerkungen zum Begriff des Autismus.* [Remarks concerning the concept of autism.] *Nervenarzt*, 1969(Oct), Vol. 40(10), 454-459.—The scope of "autism" is critically examined. The term was coined by Bleuler in 1911 and defined as "detachment from reality, with a relative or absolute predominance of the inner life. Since then, the scope of autism, as used in the psychological literature, has been rather vague. It is suggested that this term be reserved for a specific schizophrenic and/or early-childhood lack of a social-relation system. Autism is discussed under 3 headings: (a) lack of relation to reality due to overevaluation or insufficiency of the "I system"; (b) lack of relation to reality due to a breaking "I system"; and (c) autism of the depressive type. In all these cases, the real world is substituted by an imaginary one, and in this "shell" the patient lives "by himself alone," sheltered by a strong belief in his own importance. analysis. *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 149-154.—Compared the performance of 30 chronic schizophrenics and 30 patients with personality disorders on 2 measures of overinclusion. Consistent with previous research, schizophrenic Ss showed more overinclusion than nonschizophrenic Ss on an R. W. Payne-type test, and were more overinclusive on a Payne-type test than on an L. J. Chapman-type test. Results are interpreted within the framework of W. E. Broen and L. H. Storm's theory of partial collapse of response hierarchies in schizophrenia.—*Journal abstract.*

3444. Kardos, György & Mária, Béla. "Alkoholizmus" és szizofrenia. [Alcoholism and schizophrenia.] *Pszichológiai Tanulmányok*, 1967, No. 10, 547-554.

3445. Koh, Soon D. & Kayton, Lawrence. (Michael Reese Hosp., Psychosomatic & Psychiatric Research & Training Inst., Chicago, Ill.) **Free-recall learning by nonpsychotic schizophrenics.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 11-12.—It was hypothesized that nonpsychotic schizophrenics' mnemonic organization in free-recall learning should be loose and inefficient due to their associative dyscontrol and, consequently, their free-recall should suffer. Measures of subjective organization, categorical clustering, input-output concordance, and hierarchical clustering schemes all indicated that the organization of the nonpsychotic schizophrenics was poorest, the nonpsychotic-nonschizophrenic psychiatric patients next, and the normal controls highest. The recall performances of these 3 groups also corresponded to the organizational measures. The group differences in recall and organization both increased as the trials proceeded, but on the 1st trial the schizophrenics were comparable to the other groups in recall performances. Results are related to theories of information processing in schizophrenia.—*Author abstract.*

3446. Ludwig, Arnold M. (Mendota State Hosp., Madison, Wis.) **Chronic schizophrenia: Clinical and therapeutic issues.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 380-399.—Presents an extensive discussion of why patients continue to be schizophrenic. 3 theories have been advanced to explain "chronicity": (a) organic malfunctions, (b) institutional influences, and (c) "willful actions on the part of the patient himself." The 1st suggested that a genetic developmental disorder had brought about the illness and, therefore, the patient could not really help himself. The 2nd theory proposed that the debilitating atmosphere of the hospital is responsible for prolonging schizophrenia. The last theory recommended that at some level of consciousness the patient chooses to require lengthy hospitalization. It is assumed that, regardless of origin, the patient does undergo an altered state of consciousness (ASC) which causes him to perceive reality in an aberrant manner. It is suggested that the institution would not create such a profound effect if the patient were not susceptible to it. The behavior of patients, even under ASC, is always goal directed. Acceptance of these assumptions then implies the treatment techniques of gaining the patient's attention, and the use of techniques to arouse the patient.—C. O'Donnell.

3447. Magaro, Peter A. & Vojtisek, John E. (U. Maine) **Embedded figures performance of schizophrenics as a function of chronicity, premorbid adjustment, diagnosis and medication.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 184-191.

—Presents data on the Embedded Figures Test (EFT) performance of 487 schizophrenics and other hospitalized patients divided in terms of chronicity, premorbid adjustment, diagnosis, and medication. Results indicate that chronicity was related to EFT performance, with chronic Ss generally more field dependent than acute Ss. Some schizophrenics, however, were relatively field dependent when entering the hospital and did not change with extensive hospitalization. Medication interacted with premorbid adjustment and diagnosis, with the medicated poor paranoid performing in a field-independent manner while the nonmedicated poor paranoid was quite field dependent. The effects of institutionalization are discussed. (21 ref.)—*Journal abstract.*

3448. Meehl, Paul E. (U. Minnesota) **High school yearbooks: A reply to Schwarz.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 143-148. Examines the criticism of J. C. Schwarz (see PA, Vol. 44:14955) of the study by C. N. Barthell and D. S. Holmes (see PA, Vol. 42:17448) on preschizophrenics using archival data. The traditional assumption that nuisance variables like social class should routinely be "controlled" by case-matching or statistical suppression is challenged. Whether and how much, shared variance should be removed in archival studies is shown to hinge upon a prior causal framework. It is argued that in most archival studies the assumption is highly problematic, and no safer than the substantive theory of interest itself. It is further argued that statistical control of nuisance variables is not "playing it safe," since under several plausible assumptions such control will generate misleading results (e.g., will pseudofalsify a good causal theory). (22 ref.)—*Journal abstract.*

3449. Morrison, Delmont; Miller, Dale, & Mejia, Berta. (U. California, Medical Center, San Francisco) **Effects of adult verbal requests on the behavior of autistic children.** *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 510-518.—The failure of autistic children to respond appropriately to verbal request may be due to developmental receptive aphasia or to the interpersonal conflicts of the autistic child. Using 2 8- and 10-yr-old boys as Ss, the effects of adult verbal request on the performance of autistic children were investigated in verbal discrimination tasks. Results demonstrate that the Ss' performances on a series of discrimination tasks shifted abruptly from random to better-than-chance discrimination when 1 of the objects to be discriminated was replaced by another object. Data is interpreted as indicating that failure to discriminate was not caused by inability to understand the request, but rather may have been due to Ss' conflicts concerning compliance and resistance to adult requests. *Journal abstract.*

3450. Neale, John M. (State U. New York, Stony Brook) **Perceptual span in schizophrenia.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 196-204.—Administered a forced-choice letter recognition task to assess the span of apprehension of 30 schizophrenics (good premorbid paranoids, good premorbid nonparanoids, and poor premorbid nonparanoids) and 20 anoids, and poor premorbid nonparanoids and penitentiaries (hospitalized nonpsychotics and penitentiaries). When the task required only that 1 target letter be detected, there were no significant differences between groups. When the target was presented in conjunction with varying numbers of irrelevant "noise" letters, however, the span of schizophrenics was significantly less than that of either control group. The span of

schizophrenics reached an upper limit at a small display size (4 letters) and showed no further increase. The constructs of premorbid adjustment and paranoid status bore no relationship to the deficit. Measures of the trial-to-trial variability in number of elements processed and consistency of scanning path did not differentiate schizophrenics and controls. The number of irrelevant noise letters surrounding a target was found to have no influence on detection in either group. (23 ref.)—*Journal abstract*.

3451. Nuttall, Ronald L. & Solomon, Leonard F. (Boston Coll., Inst. of Human Sciences) **Prognosis in schizophrenia: The role of premorbid, social class, and demographic factors.** *Behavioral Science*, 1970 (May), Vol. 15(3), 255-264.—Explored the relative prognostic significance of 7 premorbid factors derived from case history ratings and a set of demographic variables for a sample of 259 male schizophrenic patients. The prognostic significance of a number of indicators varied as a function of the social class of the patient. Multiple regression analyses indicate that the case history factors were more powerful in predicting a patient's outcome than were the demographic factors. Implications for diagnostic procedures and research are discussed. (33 ref.)—*Journal abstract*.

3452. Odhner, Fred. (New York State Dept. of Mental Hygiene, Albany) **Verbal ascendancy in process- and reactive schizophrenics.** *American Journal of Occupational Therapy*, 1971 (Jan), Vol. 25(1), 7-9.—Attempted to find if there were differences between process- and reactive-type schizophrenic Ss in verbal ascendancy when such Ss participated in small group discussions following group tasks. It was found that the process-type Ss were significantly lower in ascendancy than were those defined as having reactive-type pathology. Implications for further research and therapeutic approaches are discussed.—*Journal summary*.

3453. Owen, Jeannine D. (Washington U.) **The effects of chlorpromazine on performance of schizophrenic patients on two tests for brain damage and related measures.** *Dissertation Abstracts International*, 1971 (Jan), Vol. 31(7-B), 4343.

3454. Pickford, R. W. (U. Glasgow, Scotland) **Disguise in the expression of fantasy: The "art-work" in painting.** *Bulletin of Art Therapy*, 1968 (Jul), Vol. 7(4), 167-184.—Discusses the paintings a young male schizoid patient produced following discharge from the Air Force. The varying degrees of disguise of the fantasy themes in the pictures are emphasized. Black and white reproductions of 20 of his drawings are included and discussed around 5 basic themes which center upon mother-infant relationships, sexuality, conflicts in the family, etc.—P. McMillan.

3456. Rennert, H. & Mode, H. (Martin Luther U., Clinic & Polyclinic for Psychiatry, Halle-Wittenberg, E. Germany) **Mischwesen und Monstren in der Vorstellungs- und Ausdruckswelt der archaischen und psychotischen Menschen.** [Mixed beings and monsters in the concepts and expressions of archaic and psychotic people.] *Nervenarzt*, 1969 (Jan), Vol. 40(1), 8-17.—Compared monsters in ancient and modern art with drawings made by schizophrenics, displaying

similar characteristics, as shown by the illustrations of the article. "Mixed beings"— $1/2$ human, $1/2$ animal—symbolized in ancient times the animal characteristics which exist as latent or potential qualities in human beings. In classical mythology, "superhuman" characteristics (Zeus) appear besides "subhuman" ones (Leda and the Swan). In the drawings of schizophrenics, similar traits are common. In both cases, monsters represent the concretization of chaotic destructive fears of people, expressed in demoniac symbols, characterized by malevolence, cruelty, and superior power. While such beings in ancient drawings appear to be harmonious and plausible in their relations to religious symbolisms, they are grotesque, disproportionate, and repulsive in the expressions of schizophrenic minds. (34 ref.)—P. von Toul.

3457. Silverman, Lloyd H., Candell, Peter; Pettit, Tupper F., & Blum, Elizabeth A. (Manhattan Veterans Administration Hosp., N.Y.) **Further data on effects of aggressive activation and symbiotic merging on ego functioning of schizophrenics.** *Perceptual & Motor Skills*, 1971 (Feb), Vol. 32(1), 93-94.—Reports further data on the effects of subliminally presented aggressive and symbiotic stimuli on the ego functioning of schizophrenics. Ss were 48 relatively differentiated male schizophrenics seen individually for 3 sessions. The main positive findings were that the aggressive stimulus had an adverse effect on self-concept while the stimulation of the theme of symbiotic merging, as it had in earlier experiments, led to a reduction in pathological manifestations.—*Journal abstract*.

3458. Siomopoulos, V. (Illinois State Psychiatric Inst., Chicago) **Paralogic involvement of the notion of awareness in schizophrenic thinking.** *Psychiatric Quarterly*, 1970 (Apr), Vol. 44(2), 305-322.—Thought mechanisms underlying the delusional ideas of 4 schizophrenics were mostly unconscious and had to be inferred from verbal cues elicited after inquiry into the delusional ideas. The patients employed paralogic mechanisms involving the awareness of highly invested contents, resulting in a variety of delusional ideas despite an appearance of homogeneity in the clinical pictures.—D. Prager.

3459. Sojit, Cloë M. (1695 Posadas, Buenos Aires, Argentina) **La hipótesis del doble vínculo y los padres de esquizofrénicos.** [The double bind hypothesis and the parents of schizophrenics.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970 (Dec), Vol. 16(4), 327-340.—A double-bind situation was employed to compare the interaction patterns of the parents of schizophrenics, delinquents, ulcerative colitis patients, and controls (total N = 54 couples). The main finding was that the parents of schizophrenics have incongruent patterns of communication, as compared to the other parents. Results support the double-bind hypothesis as a theory of the current family situation of the schizophrenic. It is suggested that the different ways to respond to double-bind situations exhibited by the parents seem to be related to the different types of pathology presented by the offspring. (18 ref.)—*English summary*.

3460. Streiner, David L. & Watters, Derek A. (McMaster U., Hamilton, Ontario, Canada) **Instrumental conditioning of the GSR in normals and schizophrenics.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6 (Pt. 1), 33-34.—Normals and drug-free schizophrenics were given training involving associating verbal stimuli to the onset and offset of a noxious noise. Following this, they

were compared with 2 groups, not given the training, on the ability to control their GSR in an avoidance paradigm where producing and inhibiting GSRs were contingencies for avoidance of the noise. Training abetted the ability to control the GSRs for the normals and schizophrenics. Reactivity to the stimuli and number of correct responses were not related to diagnosis. It is suggested that previous findings of poorer conditioning in schizophrenics may be confounded by the effects of psychoactive medication.—*Author abstract.*

3461. Taylor, Irving A. & Knapp, Marion W. **Creative artistic production of chronic schizophrenics through simultaneous sensory stimulation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 411-412.—Attempted to induce creative artistic production in chronic schizophrenics through intensive simultaneous sensory stimulation (SSS). 10 experimental chronic schizophrenics were treated biweekly to SSS over an extended 6-mo period. Their art work during this period became more creative as evidenced by being more generative, original, complex, condensed, impactful, relevant, and transforming. A comparable control group of 10 chronic schizophrenics showed no appreciable change in their art production over a similar period of time. It is concluded that sensory stimulation, possibly through brain arousal, operates with chronic schizophrenics in inducing creativity as it does with normals.—*Author abstract.*

3462. Thayer, Jane & Silber, David E. (Alexandria Community Mental Health Center, Va.) **Relationship between levels of arousal and responsiveness among schizophrenic and normal subjects.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 162-173. Hypothesized that tonic arousal level, as measured by the basal skin resistance level, would be an important parameter influencing psychophysiological responsiveness to discrete stimuli. 32 schizophrenic Ss and 32 normal Ss were divided into subgroups on the basis of their resting skin resistance levels. Ss were then given 30 mild, discrete auditory stimuli, and their psychogalvanic responsiveness was assessed. The parameter of tonic arousal level accounted for the majority of variability, while psychiatric status was a negligible factor. In general, Ss manifesting high tonic arousal responded more rapidly, with more GSRs to discrete tone stimuli, with more nonspecific GSRs, and with greater amplitude of change than did Ss with low tonic arousal. Results of other studies are discussed within the framework of these findings, and it is suggested that controlling for this parameter may serve to reduce heterogeneity of results in future research. (46 ref.)—*Journal abstract.*

3463. Thornton, Charles C. & Gottheil, Edward. (Northeast Community Mental Health Center, Philadelphia, Pa.) **Social schemata in schizophrenic males.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 192-195.—Utilized J. L. Kuehne's felt figure replacement technique to investigate differences in social replacement schemata between 17 normal and 32 schizophrenic males. As predicted, the schizophrenic males, unlike the normals, did not display the schema that "people belong together." Schizophrenics, more often than normals, overestimated at least 1 of the parental-figure distances (i.e., woman-boy, and/or man-boy), a difference that was not observed for any combination of nonparental human-figure sets. Results are consistent with the notion that early parent-child conflict later generalizes to interpersonal relationships on the whole.—*Journal abstract.*

3464. Trappl, R., Heiss, W. D., & Bruck, J. (Vienna U., Inst. of General & Comparative Physiology, Austria) **Syndromanalyse und Rehabilitationsprognose chronisch Schizophrener: Anwendungsbeispiele statistischer Verfahren in der Psychiatrie.** [Syndromatic analysis and rehabilitation prognosis of chronic schizophrenics: Examples of using statistical methods in psychiatry.] *Nervenarzt*, 1969(Jun), Vol. 40(6), 264-268.—A precondition of any statistical examination is the recording of the symptoms according to a scale. Depending on the type of scale, various methods exist for the calculation of correlation coefficients describing the statistical connections between 2 symptoms. As an example, the use of the 4-field correlation for discovering the connections between the symptoms of chronic schizophrenics is mentioned. Correlations can serve as the basis for a factor analysis or a regression analysis. By using a special regression method, the so-called linear multiple regression, the possibility of a quantitative rehabilitation prognosis of chronic schizophrenics is shown.—*P. von Toal.*

3465. Wolff, Wirt M. & Morris, Larry A. (L. Texas, Southwestern Medical School, Dallas) **Intellectual and personality characteristics of parents of autistic children.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 155-161. Studied 5 sets of parents with autistic children, and 2 with schizophrenic offspring. Demographic, intelligence, and personality data on their families were examined. Runkel's retrospective checklist (Form E-1) was useful in distinguishing between autistic and schizophrenic disorders. Demographic and IQ findings were not supportive of conjectures about parents' remarkable intelligence and achievement levels. Parental MMPI and "A-B therapist" measures (the Kemp version of the Whitehorn-Betz A-B scale) seemed contradictory to related psychogenic hypotheses about severe childhood disturbances. Results are contrary both to positions depicting parents of autistic children as exceedingly brilliant people and as "emotional refrigerators." (26 ref.)—*Journal abstract.*

3466. Wynne, Lyman C. (National Inst. of Mental Health, Bethesda, Md.) **Communication disorders and the quest for relatedness in families of schizophrenics.** *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 100-114.—Describes 2 views of relatedness: (a) expressive—spontaneous, meaningful feelings, including experiences of warmth and affection, e.g., between mother and child and between romantic lovers; and (b) instrumental, in which greater value is given to tasks performed by interacting persons, and the focus of attention are external to themselves. Communication skills are thought to be a prerequisite for enduring relatedness in either view. Applications of these views are described in client-therapist and family relationships. Studies are described in which measures of communication deviances were useful in identifying parents of schizophrenic patients. A family case is also presented, using communication deviance results of different family members as a basis for understanding family dynamics and processes of family therapy. (30 ref.)—*H. Roemmich.*

Schizophrenia Treatment

3467. Córscico, Rubén & Chappa, Herbert J. (National U. of La Plata, Buenos Aires, Argentina) **Relaciones entre cambios clínicos y visomotores en un grupo de esquizofrénicos.** [The relationship between clinical

and visuomotor changes on a schizophrenic group.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Dec), Vol. 16(4), 350-353.—3 measures were employed to assess pre- and postclinical and visuomotor changes on a schizophrenic group of patients receiving psychopharmacological treatment: the Wittenborn Psychiatric Rating Scales, a clinical remission scale, and the Bender Gestalt Test as scored with the Pascal and Suttell technique. The 1st 2 measures showed a statistically significant reduction in scores after the treatment, but the Bender Gestalt did not result in significant data. It is concluded that the Bender Gestalt is useful to detect psychotic conditions, but is unable to assess changes in follow-up studies with psychotropic drugs of the type used in this study.—*English summary.*

3468. Foley, P. (Parramatta Psychiatric Center, New South Wales, Australia) **Some forgotten men: A remotivation programme.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 123-140.—Describes a project designed to provide therapeutic benefit for a selected group of 12 male schizophrenic patients located on a locked ward in a psychiatric clinic. Treatment consisted of a combination of the approaches of Allyon and Azrin and John Rosen. Data from 5-point scales covering 11 behavioral variables were analyzed for 10 of the patients, and significant group improvements were found in the areas of personal habits, communication, memory, socialization, and initiative. No significant change was found in psychotic behavior, orientation, cooperation, concentration, special skills, or family interaction. Further analysis indicates (a) significant changes in overall behavioral efficiency in patients 20-29 yr. old, but not in those 30-39 or 40-49; (b) no differences in intelligence; and (c) significant changes in those hospitalized under 6 yr. old, not found in those hospitalized for longer periods. The design of the program is discussed in detail, and a number of case histories are presented.—*R. Wiltz.*

3469. Levene, Howard I., et al. (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) **The aftercare of schizophrenics: An evaluation of group and individual approaches.** *Psychiatric Quarterly*, 1970(Apr), Vol. 44(2), 296-304.—Placed 31 chronically ill schizophrenics who were on maintenance phenothiazines on indefinite home leave from a state psychiatric hospital. Ss were seen for their aftercare individually for 15 min. monthly or in a group for 1 hr. monthly. 13 were rehospitalized within 1 yr. Both methods of aftercare were inadequate for community maintenance or further improvement.—*D. Prager.*

3470. Sheckman, Ronald L. (U. Kansas) **The need for a predictable reality in schizophrenia: The interpersonal context, reinforcement and the subsequent performance and self-presentation of hospitalized schizophrenics.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3716.

3471. Sheiner, Sara. (390 West End Ave., New York, N.Y.) **Investigation of a learning block in a schizophrenic.** *American Journal of Psychoanalysis*, 1969, Vol. 29(2), 205-211.—Presents the case history of a 22-yr-old woman diagnosed as a paranoid schizophrenic, and describes the emotional, intellectual, and communicative interaction which developed between the woman and her therapist and the process of growth which was stimulated. The significance of relating to another human being on his level is stressed. It is suggested "that schizophrenia is a developmental process, cognitive,

emotional, and psychologically dynamic consequent to some conjectured interference with growth."—*M. Maney.*

PSYCHOSOMATIC DISORDER

3472. Arnds, H. G. & Studdt, H. H. (U. Freiburg, Medical Clinic, W. Germany) **Psychodiagnostische Beiträge zur Persönlichkeitsstruktur von Asthmatikern.** [Psychodiagnostic studies of the personality structure of asthmatics.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1969(Apr), Vol. 15(2), 113-119.—Compared 50 asthmatics with a control group of other patients in a psychosomatic clinic by using 3 psychodiagnostic methods: a test to examine the intelligence level and intelligence functions (Hawie test), the Rorschach technique, and a color selection or Color Pyramid Test (CPT). Statistically significant difference between the control group and asthmatics in the Hawie test showed that male asthmatics proved relatively less capable in the action part than in the verbal part of the test, i.e., they had a relatively high verbal IQ and relatively low action IQ. In the Rorschach test, both male and female asthmatics showed more shock phenomena on Table VI. Women differed in some determinants and interpretation content, men in some contents. In the CPT, male asthmatics chose more white, and females more red and less grey in the "beautiful pyramids" than the corresponding control groups. No separate studies were made of males and females, but differences showed up in the secondary findings. It is concluded that asthmatics have a greater potential for emotional reactivity and more unexpressed feelings against their social environment. Certain maladjustments may be typical for asthmatics but also may occur with other psychosomatic diseases. (17 ref.)—*B. Schay.*

3473. Condrau, Gion. **Psychosomatische Krankheitslehre.** [Psychosomatic nosology.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1969(Apr), Vol. 15(2), 90-99.—Presents a lecture, delivered at the International Working Conference of the German Psychoanalytical Society and the International Forum for Psychoanalysis, analyzing the 2 principal areas of psychosomatics, i.e., understanding of the illness and psychotherapy. 3 questions require an answer: (a) the reason for the occurrence of a certain disease or neurosis; (b) why a certain organ is affected or symptom occurs; and (c) the meaning of frequently occurring changes in disease and symptoms. Included are 4 tables indicating the basic forms of human illness, theories regarding organ specificity in psychosomatic diseases, and the possibilities of psychosomatically oriented therapy. Only by applying the insight of depth psychology and neuropsychology to the science of human illnesses will psychosomatics provide a truly new understanding of human illness. By taking into consideration the basic condition of human existence a better understanding of human illnesses and therapy is gained.—*B. Schay.*

3474. Epstein, R. S., Cummings, N. A., Sherwood, Elizabeth B., & Bergsma, D. R. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) **Psychiatric aspects of Behcet's syndrome.** *Journal of Psychosomatic Research*, 1970(Jun), Vol. 14(2), 161-172.—*W. G. Shipman.*

3475. Fahrenberg, J. (U. Freiburg, Psychologic Inst., W. Germany) **Körperlich-funktionelle Beschwerden**

und Persönlichkeitsmerkmale. [Somatofunctional complaints and Personality traits.] *Nervenarzt*, 1969-(Mar), Vol. 40(3), 111-116.—Psychovegetative and psychomotor processes require a complementary psychophysiological examination. This means that the 3 methodological sides of psychosomatic processes—experience (state of health), behavior, and somatic processes—have to be covered by a specific and highly developed methodology and integrated into a comprehensive picture. A new questionnaire has been developed which measures the degree of somatofunctional complaints. Tables are included stating the results of 410 questionnaires of representative cases in the population and 183 questionnaires of students. It was shown in several investigations that the complaint frequency was based on relatively consistent personality traits, and that subjectively experienced nervousness depended very significantly on the individual manifestation of neuroticism and on the sex of S (women had more complaints), but not on extroversion, introversion, age, or education. The general factor hypothesis of nervousness can only be supported by questionnaires but not verified. However, this new questionnaire is an important means of measurement in multivariate, psychophysiological experimental studies. The statistical results offer insight into the type and frequency of the "complaints of the healthy."—B. Schay.

3476. Lazzaroni, Virgilio & Sirigatti, Saulo. *Struttura della personalità e psicosomatosi: Nota preliminare*. [Personality structure and psychosomatics: Introductory note.] *Bollettino di Psicologia Applicata*, 1969, No. 91 93, 91-96.—Initiated a revision in the existing literature on psychosomatics and of the methods used in clinical psychology. A detailed study was conducted regarding a group of syndromes traditionally defined as psychosomatic, e.g., arthritis, rheumatism, asthma, peptic ulcer, hypertension, sterility in women, and gastritis. The following methods were employed in the study: (a) questionnaires, (b) MMPI for psychological abnormalities, (c) Rosenzweig's Picture-Frustration Study for frustration, (d) Baum Test as a general projection test, (e) Progressive Matrices-38 as an intelligence test, and (f) a series of stimulations which permit the comparison of alpha rhythm modifications with respiratory and EKG modifications. 2 basic principles are emphasized as a result of the study: (a) behavior is defined as a function of the organism which tends to accept adjustment and whose structure is delimited, and (b) personality structure is considered as a careful study of the behavior structure by means of differential methods. Here, continuity between efficient and deviate behavior is implied as well as the validity of biological laws. (28 ref.)—A. M. Farfaglia.

CASE HISTORY

3477. Aaronson, Bernard S. (New Jersey Bureau of Research in Neurology & Psychiatry, Princeton) *Hypnosis, depth perception and schizophrenia. Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 271-275.—A series of experiments with a single S (a 22-yr-old male college student) on the effects of posthypnotically altered perception on behavior suggests a relation between a perception on behavior suggests a relation between a schizophrenic-like condition and loss of depth perception, and a psychedelic state with enhanced depth perception. These changes were not observed with

blurred vision or enhanced visual clarity.—*Journal abstract*.

3478. Bachman, Ronald; de la Cruz, Felix F., Al-Aish, Matti, & Santell, Fredricka. (Permanent Medical Group, 280 W. MacArthur Blvd., Oakland, Calif.) *Short arm deletion of an X chromosome in a 19-year-old girl*. *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 435-441. Reports the 6th case of a 19-yr-old white female with a nonmosaic short arm deletion of her X chromosome. Findings are compared to the 5 other reported similar cases, and this group is compared to the 6 reported cases of nonmosaic long arm deletions of the X chromosome. Findings suggest that the region of the chromosome which determines the stature and phenotype in Turner's syndrome (XO) is located on the short arm of the X chromosome. (17 ref.)—*Journal abstract*.

3479. Earle, Brian V. & Theye, Frederick W. (12 1st Ave., Ithaca, N.Y.) *Automatic writing as a psychiatric problem*. *Psychiatric Quarterly: Supplement*, 1968, Vol. 42(2), 218-222.—This is believed to be the 1st case report in which automatic writing has given rise to a specific psychiatric problem. A woman's automatic writing production caused her considerable embarrassment by revealing a bomb threat which turned out to be false. She had learned the technique from a popular book. Automatic writing involves a dissociation of consciousness such as occurs in hypnosis. Relevant literature is reviewed. (15 ref.)—D. Prager.

3480. Grüneberg, F. & Helmchen, H. (Free U., Psychiatric & Neurologic Clinic, Berlin, W. Germany) *Impulsiv-Petit mal-Status und paranoide Psychose*. [Impulsive petit-mal state and paranoid psychosis.] *Nervenarzt*, 1969(Aug), Vol. 40(8), 381-385.—Reports on a 32-yr-old woman, who had suffered from an impulsive petit-mal epilepsy since she was 17. While hospitalized, an impulsive petit-mal state could be observed, followed by a short paranoid psychosis. The EEG findings indicate a general change during the postparoxysmal twilight state, while the state of paranoid psychosis indicates a partial "forced" normalization. During the interval between attacks, the EEG showed a focus with a temporal left front center of gravity. It is noted that, in the EEG proven temporal focus, an essential source for the complications of the impulsive petit-mal state could be looked for, by means of a psychotic episode and postparoxysmal automatisms. (30 ref.)—P. von Taal.

3481. Keiz, E. (Free U., Neurologic & Neuromuscular Clinic, Berlin, W. Germany) *Psychose und psychomotorische Epilepsie: Beobachtungen bei einem arteriovenösen Rankenangioma des Schläfenlappens*. [Psychosis and psychomotor epilepsy: Observations about an arteriovenous cirrus angioma of the temporal lobe.] *Nervenarzt*, 1969(Mar), Vol. 40(3), 133-137. Presents the case history of a 46-yr-old male patient suffering from an arteriovenous cirrus angioma in the left temporal lobe which after several subarachnoid bleedings (at the ages of 18, 28, and 40) led to a grand mal mixed epilepsy with impaired consciousness. After a carotid ligature the grand mal attacks ceased and a psychomotor epilepsy remained. 3 yr. after the last and bleeding a paranoid psychosis developed. Epilepsy and psychosis did not alternate but coexisted. The connections between psychomotor epilepsy, paranoid psychosis, and the limbic system are indicated and the pathogenetic role in their development is discussed. The patient's EEG improved slowly and continuously but was not forced by the uniformly decreasing psychosis. When the attack

syndrome was strong the psychotic symptoms intensified. The problems of psychopharmacological treatment are noted. (36 ref.)—*B. Schay.*

3482. **Noto Campanella, F.** (U. Milan, Inst. of Clinical Psychiatry, Italy) **Contributo clinico allo studio della verbigerazione: Analisi psicopatologica di casi personali.** [Clinical contribution to the study of verbigeration; Psychopathological analysis of personal case histories.] *Neuropsychiatria*, 1968(Oct), Vol. 24(4), 779-817.—Describes a schizophrenic-like process which is sometimes connected to hallucinations and delusions as well as stereotypes and mannerisms. A case study is presented to illustrate this process. (French, English, & German summaries) (49 ref.)—*L. L'Abate.*

3483. **Ploeger, A.** (Rhenish-Westphalian Technical School, Psychiatry Div., Aachen, W. Germany) **Anthropologische Aspekte der Hirntumorphobie.** [Anthropological aspects of brain-tumor phobia.] *Nervenarzt*, 1969(Aug), Vol. 40(8), 361-371.—Notes the difference between "anxiety" (a general feeling of being menaced) and "fear" (of objects and conditions). An anxiety neurosis without any fixed notions is to be distinguished from a "phobia," which is related to objectively unfounded but definitely expected dangers. An imaginary fear of sickness is designated as a phobia when it concerns a relatively constant notion. A fearful expectation of a sequence of organic or functional disorders is designated as "hypochondria." The cases and treatments of 2 women, each suffering from a brain-tumor phobia, are reported. A 28-yr-old office worker felt humiliated in her self-esteem in connection with sexual scruples; and a 29-yr-old ballerina suffered from fear of losing her intellectual functions (she was unhappily married and frigid). Brain-tumor phobia is believed to be an expression of a deeply felt menace to the personal self and of the fear that the personal existence may become extinct. (79 ref.)—*P. von Toal.*

3484. **Schneemann, N.** (Heidelberg U., Neuropathic Clinic, W. Germany) **Über einen Fall von psychomotorischer und Grand mal-Epilepsie mit phasischen anorektischen Zuständen.** [Concerning a case of psychomotoric and grand-mal epilepsy with phasic anorexia states.] *Nervenarzt*, 1969(May), Vol. 40(5), 215-220.—Describes a 52-yr-old female who had suffered from epileptic attacks since she was 14 yr. old and from phasic anorexia since she was 19. The periodicity of her anorexia is believed to indicate a connection with her epileptic condition, due to the drives centered in the oral and sexual regions which were suppressed by S. This seems to be confirmed by the Penfield-Jasper concept of "epileptic facilitation." A close interlacing of somatic and psychodynamic events may have a connection with the "rhinocephalic origin" of psychomotor epilepsy. (2 p. ref.)—*P. von Toal.*

3485. **Viscott, David S.** (Boston U., Medical School) **A musical idiot savant: A psychodynamic study, and some speculations on the creative process.** *Psychiatry, Washington, D.C.*, 1970(Nov), Vol. 33(4), 494-515.—Reviews previous literature on cases of idiot savants and presents a case history of a 40-yr-old woman who was considered "mentally retarded." The patient was seen after an accident had disrupted her routine life and she had become confused and suicidal. When she was a child she was isolated from the rest of the family and placed in a crib next to the piano in the studio where her mother taught music. She was able to give the day of the week for any date between 1920-1970 with 95%

accuracy and her musical knowledge is such that she can identify almost any major work of symphonic music with key, opus number, 1st performance, and vital sketches about the composer. She has absolute pitch, can play piano and violin, and can change keys in the middle of a piece without losing a beat. She is able to play a melody in the style of any given composer. Although she is not able to think abstractly in other areas, in the area of music she performs abstractions difficult for a serious music student. Ideas raised by this patient on the peculiarities of the creative process are also discussed. (17 ref.)—*E. M. Uprichard.*

MENTAL HEALTH & REHABILITATION

3486. **Beussee, Mary P., Hammes, John A., & Ahearn, Thomas A.** (U. Georgia, Civil Defense Research) **Effects of fallout shelter confinement on mental health.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 121-123.—While recognizing that volunteers for a 2-wk stay in a fallout shelter lack the stresses incident to a forced stay, nevertheless, certain behavior patterns emerged which could advantageously be made available to managers and other personnel in charge.—*A. M. Cawley.*

3487. **Bower, Willis H.** (Arizona State Hosp., Phoenix) **Recent developments in mental health manpower.** *Hospital & Community Psychiatry*, 1970(Jan), Vol. 21(1), 11-17.—Describes the great need for personnel in the mental health field and the development of the subprofessional category of worker. Changes in the authoritarian structure of mental hospitals in the 1950s shifted the emphasis from control of the patient to liberation. Interdisciplinary relationships were also forced to change with a lessening of the direct relationship of the psychiatrist and patient, and a growth in the responsibility of the aides and nurses. The psychiatric technician category of worker developed and colleges inaugurated 2-yr programs leading to certification in this area. Current educational programs are outlined, and recommendations are made for the type, length, and orientation of training for the subprofessional.—*S. Knapp.*

3488. **Cruickshank, William M.** (U. Michigan) **Rehabilitation: Toward a broader spectrum.** *Psychological Aspects of Disability*, 1970(Nov), Vol. 17(3), 149-158.—Presents a summary statement on the past performance of psychologists in the rehabilitation program and the 5 issues to which they are to speak in the immediate future: (a) limited scope of rehabilitation training, (b) CA limitation, (c) rehabilitation and disadvantage, (d) interdisciplinary role, and (e) ecological training.—*N. De Palma.*

3489. **DeRosis, Helen A.** (Roosevelt Hosp., New York, N.Y.) **Parent group discussions: A preventive mental health technique.** *Family Coordinator*, 1970(Oct), Vol. 19(4), 329-334.—If the parent is the true primary preventive agent in a program for prevention of learning and behavioral disorders, the professional community has the responsibility to explore effective, economic methods for enhancing the parent's understanding and skills. This paper describes a procedure which has been found to have some effectiveness in parent group discussions in a public school setting.—*M. W. Linn.*

3490. **Dumas, Neil S. & Muthard, J. E.** **Coordinating research and practice.** *Journal of Rehabilitation*, 1971(Jan), Vol. 37(1), 34-37.—Describes the roles,

functions, and activities of the 7 Regional Rehabilitation Research Institutes (RRRIs) sponsored by the Social and Rehabilitation Service. The core research, selections from recent major publications, and key personnel of this nationwide network of institutes are listed. The original and continuing expectation of this grant program is the establishment of 1 RRI in each region. As vacancies occur in the list, other institutes will be established.—*M. A. Seidenfeld.*

3491. **Dunning, Helen.** (U. Southern California) **The territorial instinct and its relevance to the occupational therapy process.** *American Journal of Occupational Therapy*, 1970(Nov), Vol. 24(8), 569-571.—This discussion of territorial instinct presents a few introductory ideas on a subject with many questions and need for further exploratory research. How can the physical environment be manipulated for treatment purposes? Can territorial need be recognized and met through program planning? Does this grid contribute to program evaluation? The concept of territoriality is related to occupational therapy as a profession that acknowledges that space is one of the needs of an individual. For professional growth and maturity territorial needs must be perceived and integrated in life space. An effective treatment environment helps the staff and patients to fulfill biological, psychological, and social needs for space.—*Journal summary.*

3492. **Ellsworth, Paul D. & Colman, Arthur D.** (Tripler General Hosp., Honolulu, Hawaii) **The application of operant conditioning principles.** *American Journal of Occupational Therapy*, 1970(Nov), Vol. 24(8), 562-568. Discusses 6 planned motivational systems used to improve work therapy performance of character and behavior disorder in a military setting. All systems include leadership, decision-making, competition, social and point reinforcements. The reinforcement systems are presented in a historical fashion as they developed and should help other therapists plan and implement similar programs where the motivation of patients is a key concern.—*Journal summary.*

3493. **Ethridge, David A. & McSweeney, Maryellen.** (Dept. of Mental Health, Bureau of Operational Planning, Lansing, Mich.) **II. The hypothesis: Research in occupational therapy.** *American Journal of Occupational Therapy*, 1970(Nov), Vol. 24(8), 551-555.—The concept of the use of the hypothesis in research is developed as one of a series of articles on research methodology for the occupational therapist.—*M. A. Seidenfeld.*

3494. **Ginsberg, Stewart T., Manolio, Anthony P., & Salerno, Joseph.** (Veterans Administration Hosp., Lyons, N.J.) **SCOPE: A venture in hospital-community collaboration.** *Hospital & Community Psychiatry*, 1970(Jan), Vol. 21(1), 21-23.—Describes the simulated conditions of practical employment (SCOPE) program, a sheltered workshop which functions within a mental hospital framework. Patients are assigned to the hospital factory on the basis of skills and potential for benefiting from the program. Various types of contracts are made with the business community involving work of different degrees of complexity. Of 432 patients assigned to SCOPE, 52% were returned to the community with a readmission rate of less than 5%. It is concluded that the program is beneficial not only to the patient but also in improving community relations for the mental hospital.—*S. Knapp.*

3495. **Gray, Robert M., Reinhardt, Adina M., & Ward,**

John R. (U. Utah, Medical School) **Psychosocial factors involved in the rehabilitation of persons with cardiovascular diseases.** *Rehabilitation Literature*, 1969(Dec), Vol. 30(12), 354-359 & 362.—Utilizing data from national (N=4463) and community (N=109) samples, it was found that cardiovascular Ss, as compared with comparable groups of otherwise disabled persons, tended to deny their illness more frequently and were less willing to accept their illness realistically or adopt the sick role. As a result, cardiovascular patients were rehabilitated less frequently than other disabled persons. When entered into a rehabilitation program emphasizing the need for acceptance of the impairment, the disparity in rehabilitation success rates vanished.—*S. L. Warren.*

3496. **Griffin, J. D.** (Canadian Mental Health Assn., Toronto, Ontario) **Mental health and its changing perspectives.** *Canada's Mental Health*, 1971(Jan), Vol. 19(1), 3-7.—Discusses changes and refinements in the principles of mental health treatment. The concept of mental health has been extended from a concern with strictly medical illness, e.g., psychosis, to areas where medical responsibility is less clear, e.g., divorce and poverty. Professional help is not available for the entire population and resulting varied needs. It is suggested that traditional psychotherapy is in any case inadequate for many of these people. Recommendations for changes emphasize "(a) the importance of interprofessional collaboration in mental health planning and services; (b) the need for further decentralizing and diversifying mental health services to meet the needs of isolated and impoverished groups; (c) the need for coordination of the mental health services to improve efficiency and decrease expensive overlap; and (d) the need for and role of lay participation in mental health planning."—*S. Knapp.*

3497. **Jackson, Barbara N.** (San Jose Hosp., The Oaks Extended Care Unit, Calif.) **The occupational therapist as consultant to the aged.** *American Journal of Occupational Therapy*, 1970(Nov), Vol. 24(8), 572-575.—The role of the occupational therapist working with the aged in the community has expanded greatly with the advent of Medicare. This paper is concerned with the direction of this outreach into the community and some of the problems that are encountered when the occupational therapist moves from the acute hospital or rehabilitation center into the community at large.—*Journal summary.*

3498. **Martin, Alexander R.** (Beaverbrook Rd., Lyme, Conn.) **Idle hands and giddy minds: Our psychological and emotional unpreparedness for free time.** *American Journal of Psychoanalysis*, 1969, Vol. 29(2), 147-156.—Focuses on 2 inner resources which are basically responsible for a healthy adaptation to free time—the innate capacities for effort and relaxation—and discusses blocks to their development. The predominant and harmful influence of our work culture on the development and free expression of these 2 adaptive inner resources is examined, and the necessity of education for life off the job is explored as a multidisciplinary responsibility, involving all the arts, sciences, and humanities. Case material from 10 patients is included to demonstrate our need to adapt successfully to ever-increasing free time. (29 ref.)—*M. Maney.*

3499. **Neff, Walter S.** (New York U.) **Work and rehabilitation.** *Journal of Rehabilitation*, 1970(Sep), Vol. 36(5), 16-22.—Provides a comprehensive overview of the

practical relationship that exists between work and employment and modern concepts of the rehabilitation process. In the 25 yr. preceding World War II and the similar time period that has passed since then, the emphasis has changed from a primary focus upon the physical correction of the overtly disabled to the current emphasis upon social and vocational adaptability to the demand of his society as well as the correction of his medical defects. Discussed are the methodological approaches to the assessment of work potential in the individual with particular emphasis on the disabled person, and to study the ways in which people adapt not only to work but to the adjustment to work. The work sample, situational assessment, and the rehabilitation workshop are discussed in this light. (16 ref.)—*M. A. Seidenfeld.*

3500. O'Morrow, Gerald S. (Indiana State U.) **Recreation counseling: A challenge to rehabilitation.** *Rehabilitation Literature*, 1970(Aug), Vol. 31(8), 226-233.—Contends that because our achievement-striving culture places a higher value on work than on leisure activities, professional rehabilitation efforts in behalf of the disabled have tended to concentrate on the former to the neglect of the latter. Reviewing some of the literature in recreation counseling, the author's own study of recreation services to psychiatric patients in relation to predischARGE planning and aftercare, as well as personal experiences in the field, it is concluded that recreation counseling is an effective and constructive service which can enhance the rehabilitation process and help disabled individuals to deal more successfully with the demands of daily living.—*S. L. Warren.*

3501. Shainess, Natalie; Tobach, Ethel, & Headley, Dorothy. (Columbia U., Coll. of Physicians & Surgeons) **The mental health movement meets women's lib.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 1-9.—3 women—a social work administrator, a clinical psychologist, and a research worker in animal behavior—discuss the impact of the women's liberation movement on various aspects of mental health fields: biological, psychological, cultural, directions and trends of research.—*A. M. Cawley.*

3502. Shearer, Robert M. (Georgia Regional Hosp., Augusta) **The structure and philosophy of Georgia's half-way houses.** *Hospital & Community Psychiatry*, 1969(Apr), Vol. 20(4), 115-118.—In 1964 the state's 1st halfway house was opened for women and in 1965 one was opened for men. Each accommodates 15 clients, in addition to a married couple who serve as houseparents. Clients are kept 2-9 mo. They have spent an average of 3 yr. in a hospital. "The primary purpose of the rehabilitation residence is to help the former patient enter or re-enter employment, become self-sustaining, and reach the fullest extent of independence his capacity permits." Stability for a reasonable period is a prerequisite for entering the program. "The staff of the residence have learned to expect crises at 3 critical points: when the client 1st comes to the house, when he is seeking or beginning employment, and when he is preparing to leave the house to live elsewhere in the community." There are 3 levels of service to help clients achieve rehabilitation goals: meeting their basic needs, helping them solve problems, and helping them resolve conflicts or crises. As of 1967, 227 16-61 yr. old clients had entered the 2 residences. 163 cases were closed as rehabilitated and 52 were returned to the state hospital. 4

similar facilities have recently been opened.—*B. A. Burkard.*

3503. Siskind, George. (Larue D. Carter Hosp., Indianapolis, Ind.) **A case of counseling and confrontation with test performances.** *Rehabilitation Literature*, 1970(Mar), Vol. 31(3), 74-76.—Presents a case study which illustrates how growth and personality reorganization can be brought about through the use of the counseling process in arriving at a vocational objective. It shows how the creative and flexible use of formal test materials can aid in this process, and points out some of the differences between counseling and psychotherapy.—*S. L. Warren.*

3504. Stein, Franklin & Maletta, Donald. (Boston U., Sargent Coll. of Allied Health Professions) **The cognitive-media approach in occupational therapy.** *American Journal of Occupational Therapy*, 1970(Nov), Vol. 24(8), 545-550.—Presents a cognitive theory that can be incorporated into the field of occupational therapy. Use is made of Guilford's structure of intellect theory and the research findings obtained from the area of cognition are used in analyzing media and in creating new activities. In developing therapeutic media, consideration is given to the developmental level of the child, the cognitive regulator that filters information, the selection of the sensory channel, i.e., auditory, visual, or haptic, and the content form of the information. A therapeutic model is proposed for evaluating and treating children with learning problems, i.e., the mentally-retarded, brain-damaged, and emotionally disturbed. (25 ref.)—*Journal summary.*

3505. Stern, Walter F., et al. (United Community Services of Metropolitan Boston, Mass.) **Helping all the handicapped: State planning and vocational rehabilitation.** *Rehabilitation Literature*, 1970(Mar), Vol. 31(3), 66-73, 95.—This article is a condensation of the report of the Massachusetts Vocational Rehabilitation Planning Commission. It contains both general and specific recommendations which cover the entire rehabilitation field. It presents a graphic as well as narrative description of how the Federal-State rehabilitation agency should go about providing needed services to handicapped persons in their communities. It pinpoints existing bottlenecks and suggests innovative methods of organization, delivery, and financing of rehabilitation service.—*S. L. Warren.*

3506. Stone, Gayle V. (U. Minnesota) **The relationship between personality and work need-reinforcer correspondence.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4346-4347.

3507. Sturm, Israel E. & Lipton, Herbert. (Veterans Administration Hosp., Northport, N.Y.) **Preparing former patients for jobs.** *Hospital & Community Psychiatry*, 1970(Feb), Vol. 21(2), 68.—Presents 6 suggestions from a group of personnel consultants on how to make the patient a better job prospect: (a) a graded rehabilitation program geared to individual needs for vocation training; (b) active liaison between clinical and rehabilitation workers, employment personnel, and the patient; (c) deemphasis of the patient's clinical status when evaluating job potential; (d) awareness that a shortage of workers or skills will overcome some prejudices concerning the employment of the patient; (e) caution in committing details of hospitalization in writing; and (f) availability of after-care facilities.—*S. Knapp.*

3508. Wahler, H. J. & Marks, John. (State Dept. of Institutions, Ft. Steilacoom, Wash.) **Recover: An opportunity program for ex-patients.** *Hospital & Community Psychiatry*, 1969(Jan), Vol. 20(1), 10-12.

3509. Wright, Logan. (U. Oklahoma, Medical Center, Oklahoma City) **Components of positive mental health.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 277-280.—Administered 30 items designed to measure behavior in the 6 areas described by M. Jahoda as comprising positive mental health to 256 and 393 undergraduates. Data were factor analyzed in order to determine if Jahoda's 6-component structure could be supported statistically. Results consistently reveal a 4-factor structure in which (a) 3 components collapse into a single 1st factor entitled task and perceptual effectiveness; (b) 2 other areas combine to produce a 2nd factor entitled autonomy and self-actualization; and (c) 2 factors, commitment and openness, not included in Jahoda's original 6, were also obtained. Results are interpreted as indicating some incompleteness in Jahoda's 6-category scheme.—*Journal abstract*.

COUNSELING & GUIDANCE

3510. Anderson, Herbert. (Princeton Theological Seminary, N.J.) **Alfred Adler's individual psychology and pastoral care.** *Pastoral Psychology*, 1970(Oct), Vol. 21(207), 15-26.—Discusses Adler's potential contribution to pastoral care and counseling in terms of his stress on community feeling, goal-setting, and style of life.—*O. Strunk*.

3511. Baker, Frances S. (Case Western Reserve U.) **A comparison between two methods of teaching prospective counselors to provide high therapeutic conditions.** *Dissertation Abstracts International*, 1970-(Dec), Vol. 31(6-B), 3698.

3512. Bennett, George F. (Central State Hosp., Louisville, Ky.) **Pastoral care in psychiatric crisis.** *Pastoral Psychology*, 1970(Jun), Vol. 21(205), 35-40.—Case illustrations reveal 4 factors that can guide the pastor to dealing with instances of psychiatric crisis—consultation, continued communication of concern and care, respect for person, and fellowship.—*O. Strunk*.

3513. Bruhl, Richard G. (Vanderbilt U. Hosp.) **Creating the pastoral setting.** *Pastoral Psychology*, 1970(Jun), Vol. 21(205), 26-34.—The function of the pastor in pastoral care, as well as in counseling, is to create a setting—a definite, limited relationship—for which the pastor is ultimately responsible. The pastor should understand and own this setting so that he can offer it confidently to others for their benefit.—*O. Strunk*.

3514. Collie, Robert M. (United Methodist Church, Columbus, O.) **Pastoral counseling in the context of social action.** *Pastoral Psychology*, 1970(Oct), Vol. 21(207), 45-48.—"The epidemic stature of psychic contagion today demands new techniques on the part of those who have skills in working with unbalanced persons." Milieu, recreational, bibliotherapy, psychodrama, and other approaches will help ministers to be social psychotherapists as well as private counselors.—*O. Strunk*.

3515. Dubner, Harriet W. (Forum School, Ridgewood, N.J.) **A speech pathologists talks to the Parents of a nonverbal child.** *Rehabilitation Literature*,

1969(Dec), Vol. 30(12), 360-362.—Presents the text of a letter which the author uses as an aid in counseling parents of nonverbal children. It includes a description of the natural development of language in infants, the role of the speech pathologist, and the ways in which the parent can help the child with language problems.—*S. L. Warren*.

3516. Fritchey, Kathleen H. (U. Southern California) **The effects of anxiety and threat on self-disclosure.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4336.

3517. Marlatt, G. Alan. (U. Wisconsin) **Exposure to a model and task ambiguity as determinants of verbal behavior in an interview.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 268-276.—16 undergraduates listened to a tape-recorded model discuss personal problems within each of 5 topic areas, while the 16 control Ss did not receive a model. $\frac{1}{2}$ the Ss were then told they could talk about anything they wished to in the interview. The remaining Ss were told they could talk about the same 5 topic areas discussed by the model. It was found that significantly more problems in the interview were given by the group receiving the model followed by the ambiguous task instructions. Ss exposed to the same model but who received topic-oriented instructions tended to give fewer problems in the interview. Theoretical similarities between the presentation of a model and the administration of instructions are discussed in the interpretation of the results. (23 ref.)—*Journal abstract*.

3518. Newton, Robert L. & Draper, Edgar. (Campbell Coll.) **Implications of termination for the pastoral counseling "contract."** *Pastoral Psychology*, 1970(Jun), Vol. 21(205), 7-18.—Psychotherapy and its literature have many insights about termination which are translatable into the context of pastoral counseling, especially the idea of contract or covenant. Factors involved in termination, including forced termination, are outlined.—*O. Strunk*.

3519. Owen, Carolyn M. (U. Southern California) **Effects of activity oriented group counseling with selected outpatients.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2743-2744.

3520. Speer, David C. (Amherst H. Wilder Foundation Child Guidance Clinic, St. Paul, Minn.) **Behavior Problem Checklist (Peterson-Quay): Base-line data from parents of child guidance and nonclinic children.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 221-228. Reports parent symptom-rating data on 173 child patients, 357 siblings of child patients, and 445 nonclinic children. Analysis of the data indicate that parent ratings clearly differentiate child patients from their siblings and from nonclinic children on 3 of 4 Behavior Problem Checklist factor scales: Conduct Disorder, Personality Disorder, and Inadequacy-Immaturity. An unexpected finding was that parents rated nonclinic children as more deviant than siblings of child patients. Analysis of high point scale frequencies indicate that parents of nonpatient children report most frequent greatest concern on the Socialized Delinquency scale, while this was the least frequent dimension of greatest concern among parents of child patients. Interscale correlations by sex and patient-nonpatient status suggest considerable practical scale interdependence, and also suggest that interscale correlations are greater among the ratings of nonpatients than

among parental ratings of patients.—*Journal abstract.*

3521. **Sperling, Eckhard.** (U. Göttingen, W. Germany) **Das psychotherapeutische Angebot für Studenten.** [Psychotherapeutic offers made to university students.] *Praxis der Psychotherapie*, 1970(Aug), Vol. 15(4), 162-170.—The riots, suicides, and serious neuroses of university students have become a public problem. University health services were introduced, a few years ago, in West Germany. The problems of this service are discussed, based on the experiences of the Health Service of the University of Göttingen. Since this office opened its doors in 1966, 490 students (2.5% of the student body) have sought advice. The possibilities of this service will remain limited as long as no reforms of educational methods are introduced. The chief complaints of students are: subjective efficiency failures, depressions, fears of situations including examination fright, and sexual troubles. A lack of a protective group, such as the American campus, is felt in Germany. Students suffer from an artificially prolonged adolescent situation and feel unprotected. The integration of groups of psychotherapeutically treated students is recommended.—*P. von Toal.*

3522. **Stettner, John W.** (McCormick Theological Seminary, Chicago, Ill.) **Pastoral counseling in the age of Aquarius.** *Pastoral Psychology*, 1970(Oct), Vol. 21(207), 7-14.—"The growth of 'counter culture,' widespread interest in group work, and the development of pastoral counseling as a specialized ministry have important implications for pastoral care today." Pastoral counseling in the "Age of Aquarius" is a significantly specialized part of the church's total ministry involving good group work procedures and respectfully takes account of man's ineffable experience.—*O. Strunk.*

3523. **Vontress, Clemmont E.** (George Washington U.) **Racial differences: Impediments to rapport.** *Journal of Counseling Psychology*, 1971(Jan), Vol. 18(1), 7-13.—Discusses the difficulty of achieving and maintaining rapport between white counselors and black clients. A harmonious black-black relationship may be difficult also, depending on the extent to which the counselor projects himself as "black." In general, it is easier to establish (a) a working relationship with a colored person than with either a Negro or black; and (b) a harmonious dialogue with a black, Negro, or colored female than with her male counterparts. The counselor generally can achieve rapport more quickly with individuals of African descent still living in the South than with those living in other parts of the country. Urban-rural differences are explored. It is concluded that counselor education is remiss in not revamping the curriculum to help counselors learn to relate to racial and ethnic minorities. (18 ref.)—*Journal abstract.*

Marriage & Family

3524. **Laqueur, H. Peter; Wells, Carl F., & Agresti, Miriam.** (Creedmoor State Hosp., Queens Village, N.Y.) **Multiple-family therapy in a state hospital.** *Hospital & Community Psychiatry*, 1969(Jan), Vol. 20(1), 13-20.

3525. **Leighton, Lennard A., Stollak, Gary E., & Ferguson, Lucy R.** (Michigan State U.) **Patterns of communication in normal and clinic families.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 252-256.—Found significant differences between and within 8 normal and 7 clinic families with young

children in behaviors, e.g., total number of times speaking, total and average duration of speech, number of times interrupted and interrupting, and incidences of simultaneous speech. Results, obtained from the families performing a series of experimental tasks, indicate that (a) there is more conflict in the clinic families, and (b) the normal family is characterized by a father dominance which appears to be accepted by the other members of the family, while the clinic family is characterized by a mother dominance which is unacceptable to the other family members. (15 ref.)—*Journal abstract.*

3526. **Matanovich, Jamie P.** (Arizona State U.) **The effect of short-term group counseling upon positive perceptions of male in marital counseling.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2688.

3527. **McClellan, Thomas A. & Stieper, Donald R.** (Veterans Administration Mental Hygiene Clinic, Ft. Snelling, St. Paul, Minn.) **A structured approach to group marriage counseling.** *Mental Hygiene*, 1971-(Jan), Vol. 55(1), 77-84.—A 9-mo, time-limited group therapy program for married couples was recently completed in an outpatient clinic. The program incorporated programed instruction, A. Ellis' rational-emotive psychotherapeutic approach, and structured psychodrama skits, plus extensive use of homework assignments. Group members verbally reported a positive interest in the experience and said they found it helpful. Various testing instruments indicate a variety of small changes over the 9-mo period. It is suggested that this approach be applied in those psychiatric clinics having a large number of chronic patients.—*Author abstract.*

3528. **Stevens, Don & Johnson, A. Ronald.** (Florida State U., Tallahassee) **Family group counseling.** *Hospital & Community Psychiatry*, 1969(Apr), Vol. 20(4), 111.—Assigned a county social worker to a ward at a state hospital to help staff plan discharges. As part of his work, he acted as a cotherapist with the ward social worker for a group of parents of emotionally disturbed young patients. Their clinical impression is that parents want to be involved in their children's treatment.—*B. A. Burkard.*

Social Casework

3529. **Gáti, Ferenc.** (Általános Iskola, Budapest, Hungary) **A pszichológiai szemlélet érvényesülése a gyermekvédelemben.** [Assertion of the psychological approach in child-welfare.] *Pszichológiai Tanulmányok*, 1967, No. 10, 255-258.

3530. **Lima, David R.** (Lake County Mental Health Clinic, Mentor, O.) **Social group work with dependent children.** *Hospital & Community Psychiatry*, 1969(Apr), Vol. 20(4), 122-123.—Describes a psychiatric outpatient facility which has been working with an institution for dependent children operated by a county welfare department. The home which cares for up to 18 dependent children for a maximum of 3 mo. lacked social services and recreational programs. At the end of a yr. the program was taken over by a child welfare worker and a coworker. It is believed that the program has a positive impact on a high-risk group of children at the home.—*B. A. Burkard.*

3531. **Makowsky, Bernard & Oken, Donald.** (Michael Reese Hosp. & Medical Center, Psychosomatic & Psychiatric Inst., Chicago, Ill.) **The contribution of social group work to the therapeutic milieu.** *Hospital*

& Community Psychiatry, 1969(Apr), Vol. 20(4), 119-122.—Discusses the contributions of the social group worker at the 80-bed Psychosomatic and Psychiatric Institute (PPI) of Michael Reese Hospital and Medical Center. His functions at PPI included department head of adjunctive therapy, group leader on the most disturbed ward, and team member on the most open unit. The group worker was able to influence a milieu in the total hospital because he had the backing of top administration and because the staff considered him a member of the team, not a social worker concerned only with family affairs and placement work.—*B. A. Burkard.*

3535. Turner, Francis J. (Waterloo Lutheran U., Graduate School of Social Work, Ontario, Canada) **An expanded role in mental health.** *Canada's Mental Health*, 1971(Jan), Vol. 19(1), 12-16.—Proposes that within the next decade, social work, rather than becoming more particularized, will become more allied with the related professions. Interprofessional collaboration is seen as an increasingly important role. Social work is described as becoming more involved in (a) preventative education, (b) community organization and development, (c) social planning, (d) administration of programs and personnel, and (e) regional and generic services. While education of the social worker is not seen as providing special programs in mental health, the content of the present programs will expand to include more in the area and cross-disciplinary programs will increase in number. It is concluded that "As the differences between professions in the mental health field blur, so also will be boundaries of mental health services and settings, so that optimum mental health will be the goal and the responsibility of all human services in society."—*S. Knapp.*

PHYSICAL HANDICAP

3536. Columbus, Dorothy & Fogel, Max L. (U. Pennsylvania) **Housing for the disabled: II. Characteristics of those willing to move to specially designed facilities.** *Perceptual & Motor Skills*, 1971-(Feb), Vol. 32(1), 212-214. 455 physically disabled persons were surveyed regarding their attitudes toward moving to housing facilities designed to give more independence to the disabled. While the majority were satisfied with their present living arrangements, 134 of the total group expressed a desire to move to such a facility. Those willing to move were younger, had more severe disabilities, and were more dependent upon others for daily needs. They were more often city dwellers who had lived in their present homes for a shorter period of time than those not willing to move. *Journal abstract*

3537. Lustig, Paul. (U. Wisconsin) **Differential use**

of the work situation in the sheltered workshop. *Rehabilitation Literature*, 1970(Feb), Vol. 31(2), 39-42. 49. Describes a method of behavioral modification for disabled persons in a sheltered workshop involving manipulation of the structural components of the work environment to increase the client's tolerance for avoided work activities. The author finds this method preferable for those clients who are unable to respond initially to the traditional verbal techniques of counseling and supervision. At the very least, the method provides an opening for teaching the client and making available an alternate procedure for modifying behaviors that interfere with adequate work adjustment.—*S. L. Warren.*

3538. Nickerson, Eileen T. (Northeastern U.) **Some correlates of adjustment by paraplegics.** *Perceptual & Motor Skills*, 1971(1 eb), Vol. 32(1), 11-23.—Investigated some correlates of adjustment to paraplegia, a physically immobilizing disability, which involves a number of frustrating, lifetime handicaps—e.g., the loss of the ability to walk, to feel sensation, to procreate and the control of bowel and bladder function. 48 male paraplegics were rated on hospital adjustment using a 9-point Q-sort rating scale. From the results, it appears that the patient who was better able to adjust to a physically immobilizing handicap, was one who was better able to function in society prior to his disability, as indicated by his relatively higher educational and occupational attainments. Such a patient also was motivated by more theoretic-type interests than was the patient who adjusted less well to his disability (52 ref.) *Journal abstract.*

3539. Roberts, Marjorie K. (Catholic U. of America) **Change in self-concept of leg amputees after prosthetic replacement.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3713-3714.

3540. Royer, Jacqueline. **L'expression de l'agressivité du débile à travers le test des métamorphoses.** [The expression of aggression by the handicapped on the Transformations Test.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(11-12), 628-631.—Royer's Transformations Test which consists of 20 questions such as "What animal would you most like to be? Why?" and their negative parallels ("What animal would you least like to be? Why?") and 11 questions without negative parallel concerning such things as preferred sex, preferred age, what one would do if he had lots of money, etc., was used to assess the performance of 50 handicapped children. The test was administered to 50 handicapped children with WISC Verbal 13-18 yr. old handicapped children with WISC Verbal IQs averaging 75 and 100 controls with WISC Verbal IQs averaging 107. The handicapped group tended to think by the "association of ideas and by conditioning." Poverty of ideas and perseverations were commonplace. Trite rather than original responses appeared more often in the handicapped group. Aggressive responses appeared more frequently in both handicapped boys (13.7%) and girls (11%) than in their normal counterparts (boys, 13.5%; girls, 8.4%).—*R. E. Smith.*

Blindness & Visual Disorder

3541. Lindley, Sondra P. (Case Western Reserve U.) **Kinesthetic perception in blind adults.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4340.

3542. Pickford, R. W. (U. Glasgow, Scotland) **The frequency of colour vision defective students in a school of art and the influence of their defects.**

Journal of Biosocial Science, 1969(Jan), Vol. 1(1), 3-13.—In a study with 223 art students, it was found that the frequency of red/green defectives was not different in a school of art from that in the population as a whole, and that the distribution of frequencies of subtypes was not different for men or women. 1 color defective out of 7 did not know of the defect until tested in this research. In every case where it has been used by nonpsychologists, the Ishihara Test for Colour-Blindness, used here as a measure, has given unsatisfactory information. In this research it was very unsatisfactory except for crude screening. All Ss showed surprising powers of adaptation, partly as a result of realizing their difficulties and learning to avoid colors which would give rise to difficulty. It is clear that with better testing and an understanding approach by a psychologist trained to explain color difficulties and give insight into the problem, much help could be given. It should not be necessary that all red/green defectives be excluded from schools of art, because some may have considerable artistic ability. (22 ref.)—*Journal summary*.

3543. Shagan, Joan M. (George Washington U.) **Kinesthetic memory, comparing the blind and sighted.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4320-4321.

3544. Wilson, Edouard L. (New York Assn. for the Blind, Psychology & Counseling Services, N.Y.) **Group therapy in a rehabilitation program.** *New Outlook for the Blind*, 1970(Sep), Vol. 64(7), 237-239.—In 1965, the New York Association for the Blind, referred to as the Lighthouse, introduced group therapy into its summer diagnostic program. The group consisted of 3 boys and 4 girls of college level intelligence. All members felt they had benefited. Today the Lighthouse uses group therapy, group vocational counseling, and group discussions as a part of the diagnostic phase of the rehabilitation program. Those faced with a visual handicap may also have psychological problems, and group therapy is useful in helping them cope with reactions associated with disability. "The program is not conducted along traditional analytic lines, where the focus is upon the total alteration of the developed personality, but, rather along re-educative and supportive lines using the interview technique which allows clients to enter and withdraw from the groups as their own needs dictate."—A. Burkard.

Deafness & Hearing Disorder

3545. Banerjee, Chhabi; Dutta, Anath; Chatterji, S., & Mukerjee, M. (U. Calcutta, India) **An investigation into the interest pattern of deaf children.** *Psychology Annual*, 1970(Mar), Vol. 4, 40-44.—Administered the Chatterji's Non-Language Preference Record to 100 14-18 yr. old deaf and dumb children from 2 special schools and compared results with those from 200 12-16 yr. old normal children. It was found that normal and deaf Ss differed significantly in their interest in all 10 fields except literary work and crafts. Normal Ss scored higher in scientific, medical, and technical areas, whereas deaf Ss scored higher in fine arts, agriculture, outdoor, sports, and household work. Implications for counseling are discussed.—S. Knapp.

3546. Csányi, Yvonne. **Adatok a nagyothalló gyermek gondolkodásának vizsgálatához.** [Contribution

to the investigation of thinking in children hard of hearing.] *Pszichológiai Tanulmányok*, 1967, No. 10, 677-690.

3547. Pereslenii, L. I. (Inst. of Defectology, Moscow, USSR) **Osobennosti vospriyatiya slozhnykh taktilnykh signalov u glukhikh.** [Features characterizing the perception of complex tactile signals in the deaf.] *Defektologiya*, 1970(May), Vol. 2(5), 10-19.—7 20-30 yr. old normal Ss and 8 18-21 yr. old deaf Ss participated in a study of the features characterizing the identification of complex tactile (vibrational) signals—a process by which discrimination of complex stimuli, applied to different parts of the skin of both arms (upper and lower) under conditions of temporal deficit, was attempted. 5 series of experiments with the same Ss were undertaken; in each series Ss were asked to identify 2 complex tactile signals consisting of simultaneous vibrational stimulation of several parts of the skin. Recognition of complex tactile complexes remained reliable for both groups with the reduction of time of their action to 5-10 msec. For both groups probability of discrimination and, especially, duration of latency of choice were not a function of duration of stimulus presentation within the temporal range utilized. Latency was a function of (a) the complexity of the tactile complexes, (b) the mutual disposition of the masking components, and (c) the mutual disposition of those components bearing the recognition sign. The 1st factor was especially marked in deaf Ss. The duration of the latent periods was shorter for deaf Ss.—I. D. London.

3548. Schiff, William & Dytell, Rita S. (New York U., Deafness Research & Training Center) **Tactile identification of letters: A comparison of deaf and hearing children's performances.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 150-164.—Presented the letters of the alphabet tactly to 172 deaf and 121 hearing children and adolescents. Ss identified the letters by matching from memory or with visual letters present. Errors decreased significantly with age in both groups, and were significantly influenced by matching method. The deaf/hearing factor was not significant. The pattern of errors paralleled that found with letters presented visually to prereading children, older children, and adults. Tactual errors were predicted by E. J. Gibson's visual feature list for letters. Latencies were not strongly related to variables other than letter identification difficulty. Findings are discussed in the context of amodal or cognitive feature processing strategies. (29 ref.)—*Journal abstract*.

3553. Boysen, Allen E. (U. Oklahoma) **The effects of nonreward on the object-naming latencies and response durations of normal-speaking and stuttering children.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3748-3749.

3554. Crocker, John R. (Loyola U., Chicago, Ill.) **Breakdown of symbol processing in brain injury.** *Acta Symbolica*, 1970(Fal), Vol. 1(2), 25-30.—Presents some reflections on the nature of the symbol and of symbol degeneration as evidenced by a study of aphasia. The generation transformation model of competence and performance was utilized as the heuristic for the exposition. Aphasia is not an impairment in language competence, when competence is understood as a set of principles by which a native speaker can map a deep structure into a surface structure. The impairment is on the contrary in the area of performance, i.e., attention, memory, discrimination, perception, association, combination, integration, and the "mapping" operations. This model can contribute to our understanding of symbol functioning, to better definitions, and to a model for language therapy with aphasia. (15 ref.) *M. Cynamon*.

Germany) **Aphasieprüfung mit psychometrischen Verfahren.** [Examining for aphasia by psychometric methods.] *Zeitschrift für Neurologie und Psychiatrie*, 1969(Mar), Vol. 40(3), 116-121.—Discusses the need for 2 types of tests in determining aphasia. The standard tests are devised to cover as many components of speech behavior as possible, and are suitable for the description and classification of aphasic language disturbances. However, to cover all components of speech behavior, tests of intelligence must be included which nonaphasic persons afflicted with brain disease and unintelligent normal persons will fail. Therefore, a new type of test, solely for the purpose of identifying aphasics, is needed. It should cover areas of ability in

which aphasics differ reliably from nonaphasics. The De Renzi and Vignolo Token Test showed that the area of language comprehension is sufficient. It is concluded that for clinical diagnostics and neurophysiological research it is necessary that psychometric tests exist for the identification of aphasics be devised as well. (18 ref.) *B. Schuy*.

NEUROLOGICAL DISORDER

3566. Boeters, U. (Kiel U., Psychiatric & Neuropsychiatric Clinic, W. Germany) **Die Bedeutung von Antriebsstörungen beim posttraumatischen apallischen Syndrom und seinen Folgezuständen** [Significance of impulse disturbances with a posttraumatic apallic syndrome and its sequencies.] *Nervenarzt*, 1969(Jun), Vol. 40(6), 268-272.—The apallic syndrome is defined as a brain lesion through which the consciousness is reduced to a primary level and all psychically initiated activity is suspended. It is often designated as "acute motoric" or "posttraumatic catatonia." The impulse disturbances are analyzed in their defective stages in consequence of a posttraumatic apallic syndrome, based on experiences in treating 9 cases. The *extinction* of the fixation capacity proper appears 1st in a return of the fixation capacity.

Affective-emotional reactions follow, while the speaking capacity returns relatively late. A lack of spontaneity persists for a long time. A serious psychoorganic defect syndrome remains, however, in many cases. Impulse disturbances are considered the most serious problem in the clinical practice of rehabilitation, depending on the return of a sufficient acceptance of stimuli coming from outside sources. (35 ref.)—P. von Toal.

3568. Connors, C. Keith. (Harvard Medical School, Boston, Mass.) **The effect of stimulant drugs on human figure drawings in children with minimal brain dysfunction.** *Psychopharmacologia*, 1971, Vol. 19(4), 329-333.—Reports 2 studies in which stimulant drugs (methylphenidate and dextroamphetamine) or placebo were administered to 69 children with minimal brain dysfunction. The drugs produced highly significant improvement in 1 study in the total raw scores of the figure drawings, compared with placebo. Scores presumed to measure social maturity or social interest were not affected by the drug treatments. It is suggested that the drugs probably change figure drawings by means of their influence on attention span or the child's need to perform well in the drawing task. Inconsistencies between results of different studies are accounted for by sample heterogeneity which becomes apparent when cluster analysis is employed to refine diagnosis.—*Journal abstract*.

3569. Gómírató, G. & Perfetti, C. (U. Pisa, Clinic for Nervous & Mental Diseases, Italy) **L'associazione terapeutica L-dopa amantadina: Primi risultati in un gruppo di 10 parkinsoniani.** [Therapeutical association of L-dopa and amantadine in the treatment of Parkinson's disease.] *Rivista di Neurobiologia*, 1970(Jul), Vol. 16(3), 247-254.—Studied the effects of L-dopa administered along with amantadine to 10 patients suffering from Parkinson's disease. In each case the disease had not reached climatic proportions. Initially Ss were hospitalized, and underwent clinical and electrophysiological tests. For clinical evaluation the NUDS point system was used; for electrophysiological evaluation the H reflex and blink reflex were used. After 2 mo., none of the Ss showed signs of worsening; 3 Ss showed no sign of improvement; and the rest showed improvement. There was improvement in the psychic conditions characterized by a greater participation in the environment and an ability for physical activity and for conversation. 3 Ss showed less rigidity. The greatest improvements were in walking, dressing, and attending to their own needs. (English summary)—A. M. Farjaglia.

3574. Warrington, Elizabeth K. & Weiskrantz, L. (National Hosp., London, England) **Amnesic syndrome: Consolidation or retrieval?** *Nature*, 1970(Nov), Vol. 228(5272), 628-630.—Manipulated both the method of learning and method of retrieval to determine the critical factor affecting performance of amnesics on tasks of retention (recall, recognition, and partial information). Controls and Ss were tested with the WAIS and the Lorge-Thorndike Intelligence Test. Learning for the amnesic group (N = 4) was nearly as efficient as the control group (N = 14), but a significant deficit on retention was found in the amnesic group, both by recall and recognition. It is concluded that "it is inappropriate to characterize the amnesic syndrome as being a failure of registration or consolidation." (16 ref.)—S. Appelle.

Brain Damage

3575. Beley, André P. (Hosp. of Vaucluse, Epinay-s/Orge, France) **A propos des séquelles neuropsychiques de traumatisme crânien chez l'enfant.** [Neuropsychiatric sequelae of cranial trauma in childhood.] *Annales Médico-Psychologiques*, 1970(Feb), Vol. 1(2), 233-238.—Current opinion on the concept of "rehabilitation" is questioned by means of clinical-historical analyses of head injury in 2 young patients, followed several years after their cranial accidents. Both Ss showed a gradual onset of severe emotional instability, hard neurologic signs, thought difficulty, and subnormal intellectual development. Modern life has much increased the chance for head injury to occur, but most study of posttrauma restoration of function has concerned adults (military cranial trauma). A special problem is met with child-patients whose cerebral tissue is in full process of organization through growth. Trauma may not destroy what has been already acquired, but may prevent further acquisition, which will result ultimately in a state of "acquired idiocy." The term rehabilitation is often used to mean a return to an original, or pretrauma state. Where age-related development is affected, however, it must be broadened in meaning to include expectable psychosocial growth to maturity.—H. E. King.

3582. Pishkin, Vladimir & Burn, Julian M. (Veterans Administration Hosp., Oklahoma City, Okla.) **Concept identification in the brain-damaged: Intertrial interval and information complexity.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 205-210.—Investigated the effects of information complexity and ITI in a gated concept identification (CI) problem, using 45 brain-damaged and 45 control Ss. The CI performance of the damaged and 45 control Ss. The CI performance of the damaged and 45 control Ss. The CI performance of the damaged and 45 control Ss. The CI performance of the damaged and 45 control Ss. There was but was not affected in the brain-damaged Ss. There was a linear increase in CI errors as a function of complexity in both groups, although brain-damaged Ss demonstrated a deficit on CI in terms of decision time and processing of available information. (19 ref.)—*Journal abstract*.

3583. Symmes, Jean S. (National Inst. of Child Health & Human Development, Bethesda, Md.) **Visual imagery in brain-injured children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 179-180.—Investigated the

incidence of eidetic imagery and prolonged afterimagery in a population of 5½-14 yr. old brain-injured children; all eideticers had prolonged afterimages, but not vice versa. Incidence of eidetic imagery was 19%, significantly higher than normal samples. Children with long, stable afterimages had a significantly higher mean IQ than those with short afterimages, capacity for fixation and task learning being controlled. A possible explanation of the IQ discrepancy in terms of how a longer time to process visual input into short-term memory may be functional for children of low intelligence is presented.—*Author abstract*.

3584. Wright, Logan & Jimmerson, Steve. (U. Oklahoma, Children's Hosp., Oklahoma City) **Intellectual sequelae of hemophilus influenzae meningitis.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 181-183.—10 6-15 yr. old patients who had experienced hemophilus-influenzae (H-flu) meningitis and 10 matched controls were administered 3 tests designed to measure various cognitive abilities. Significant differences were obtained on 5 of the 10 WISC subtests. No differences were found on 6 variables from Frostig's Developmental Test of Visual Perception or on the Bender-Gestalt Test. It is concluded that the effects of H-flu meningitis might be greatest in the area of perceptual-motor functioning and abstract thinking ability.—*Journal abstract*.

Epilepsy

3585. Dreyer, Rudolf. (Anstalt Bethel, Klinik für Anfallskrankheiten Mura, Bielefeld, W. Germany) **Extrapyramidale Symptomatik bei der Anwendung von krampfhemmenden Drogen.** [Extrapyramidal symptoms connected with the application of antispasmodic drugs.] *Nervenarzt*, 1969(Jan), Vol. 40(1), 17-20.—Reports on the treatments of 3 epileptic children (a 10-yr-old boy, a 6-yr-old boy, a 13-yr-old girl), with whom an additional prescription of ethosuximide and methsuximide produced an acute extrapyramidal hyperkinesia. After discontinuing the succinimides, the striated symptoms were reduced with an unchanged basic medication. The consciousness remained unaffected. A renewed dosage of methsuximide had the same effect with 1 of the patients. Akineton assuaged the extrapyramidal symptoms, but could not dislodge them. It is suggested that the succinimides can cause in serious therapy-resisting cases, acute extrapyramidal hyperkineses, and that methsuximide could change motor reflexes in the meaning of parkinsonism. The symptoms described proved to be reversible. The acute features are independent of the dosage to a large degree, parkinsonism, however, is dosage dependent. P. von Toal.

3586. Hallen, O. (U. Heidelberg, Neurolog. Clinic, W. Germany) **Zur Problematik der sog. psychomotorischen Anfälle.** [Problems of so-called psychomotor fits.] *Nervenarzt*, 1970(Sep), Vol. 41(9), 421-425. motor fits.] Notes that "psychomotor fits" are not synonymous with "temporal-lobe epilepsy." A psychomotor fit differs from all other epileptic equivalents by a multiple symptomatology, and mainly by the simultaneity of event, experience, and actions. A core of the fit can be established, which is typical for the various subforms of psychomotor fits. The oral type of the psychomotor fit is given as an example. The core of the fit is "framed" by psychopathological states, considered to be psychotic by a dreamy state with full recognitions, hallucinations,

experiences of heterogeneity, etc. The fit proper is followed by a regular dreamy state, in which the patient acts. In discussing the question of localization, it is pointed out that such fits can originate from other sources than the temporal lobe, e.g., from the thalamus and/or from the region of the orbitofrontal rings.—*P. von Toal*.

3587. **Oller-Daurella, L.** (Hosp. Sagrado Corazón, Barcelona, Spain) **La crisis tónico-automáticas: Descripción clínico-E.E.G.** [Tónico-automatic crises: Clinico-EEG description.] *Archivos de Neurobiología*, 1970(Jul), Vol. 33(3), 303-316.—Discusses the etiological, clinical, EEG, and nosological aspects of a new type of epileptic crisis manifesting bilateral tonic movements following gestural or oral automatisms. In 8 cases, over 50 crises were photographed and recorded, with clinical manifestations including: (a) loss of consciousness as the initial phenomenon, continuing to the end of the crisis; (b) tonic contraction of the proximal muscles of the upper extremities and the flexors of the neck, lasting 1-6 sec., with flexion of the head and raising of both arms horizontally; (c) occasional affection of the legs; (d) automatic phenomena of varied intensity, such as chewing, swallowing, licking the lips, or gestures; and (e) a postcritical obnubilation of short duration. EEG findings include a recruiting rhythm of 10-20 cps, corresponding exactly to the clinical manifestations, and spike and slow wave discharges of variable nature. The differential diagnosis is discussed and the place of these crises in international classification, specifying the types of epilepsy in which they appear. It is concluded that 7 of the 8 patients described presented the Lennox-Gastaut syndrome of late onset. (English & French summaries)—*T. N. Webster*.

3588. **Rabe, Franz.** (U. Düsseldorf, Neurological Clinic, W. Germany) **Diagnostische Probleme bei der Unterscheidung von hysterischen und epileptischen Anfällen.** [Diagnostic problems in distinguishing between hysteric and epileptic fits.] *Nervenarzt*, 1970(Sep), Vol. 41(9), 426-429.—In the modern literature, the difference between epileptic and hysteric fits has been neglected, in the belief that hysteric fits seldom occur, that their difference is etiologically and pathogenetically clear, or that they are hidden under the diagnosis of epileptic fits. Gastaut stressed the difficulty of a differential diagnosis of these 2 types of fits. The author reports his own observations on this diagnostic problem. His diagnoses are based on the clinical features and on the aspects of the disease, i.e., not on individual symptoms, but on the entire course of the fit. Epileptic fits cannot be changed, controlled, or interrupted "from the outside," but this can be done with hysteric fits. However, due to the similarity of symptoms in both types of fits, a correct diagnosis remains difficult, especially in differentiating between psychomotor and hysteric fits, in both of which no loss of consciousness occurs. As a differential diagnosis between epileptic and hysteric fits remains problematic, extreme diagnostic skepticism is recommended.—*P. von Toal*.

3589. **Wolf, P.** (U. Heidelberg, Neurological Clinic, W. Germany) **Zur Klinik und Psychopathologie des Status psychomotoricus.** [Clinic and psychopathology of status psychomotoricus.] *Nervenarzt*, 1970(Dec), Vol. 41(12), 603-610.—Psychomotor states are believed to be extremely rare. 2 forms can be distinguished: (a) a discontinuous state of psychomotor attacks with brightening intervals between individual attacks taking their

full course (this form causes no differential diagnostic difficulties); and (b) a form which, at 1st, appears to be continuous, proceeding under the clinical aspect of a twilight state. The latter is discussed in detail, based on the literature and on the author's observations. The symptoms are characterized by serious impulse disturbances, alternating between inhibitions and intensifications, insomnia and anorexia, a sense of discomfort, and disturbances of coherence and concentration. Disturbances of orientation, consciousness, mnestic functions, and aspects of higher intelligence often retreat entirely to the background. For this type of state, the term "psychosomatic state with rudiments of attack" is suggested. The problems of differential diagnosis are discussed.—*P. von Toal*.

MENTAL RETARDATION

3590. ———. **Care of mentally retarded.** *British Medical Journal*, 1970(Feb), Vol. 1(5695), 517.—Asserts that facilities for the care of the mentally retarded are dreadfully poor, and the urgent need for money is stressed. The allocation of more funds by Richard Crossman, Secretary of State for Social Services in England, is welcomed. It is charged, however, that Crossman's blame of the medical profession for the weaknesses of the service is motivated by political considerations. Parliament must find adequate resources for running the Health Service.—*S. R. Diamond*.

3591. **Bailey, Jon & Meyerson, Lee.** (Florida State U.) **Effect of vibratory stimulation on a retardate's self-injurious behavior.** *Psychological Aspects of Disability*, 1970(Nov), Vol. 17(3), 133-137.—Brief response-contingent and continuous, noncontingent vibration conditions were presented to a profoundly retarded, crib-bound child who exhibited several persistent self-injurious behaviors. Lever pressing, reinforced by 6 sec. of vibration, proved to be incompatible with these self-injurious behaviors and reduced them from base-line levels. Free continuous vibration, however, was even more effective. During the time it was in effect, self-injurious behavior in this S was almost completely eliminated.—*Journal abstract*.

3592. **Beck, Robert N.** (U. Kansas) **Syntactic abilities of normal, and mentally retarded children of similar mental age.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3748.

3593. **Calcedo Ordóñez, A. & Fornell Forcadás, J.** (Dispensary of Mental Hygiene, Cadiz, Spain) **Oligofrenia fenilpirúvica en primos hermanos: Aportación a la casuística nacional.** [Phenylpyruvic oligophrenia in first cousins: Contribution to the national casuistic.] *Archivos de Neurobiología*, 1970(Jul), Vol. 33(3), 261-271.—Presents 2 rare cases of phenylpyruvic oligophrenia. The existence of carriers of the disease within the families involved was investigated, and different results obtained with the same methods (chromatographic determination of phenylalanine in the blood and Guthrie's test) in the parents of the patients. The influence of ecological factors was discussed in the interpretation of the clinical picture, with special reference to 1 of the cases presented. (French summary)—*English summary*.

3594. **Collins, Hardin A., Burger, Gary K., & Doherty, Daniel.** (St. Louis U.) **Self-concept of EMR and nonretarded adolescents.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 285-289.—Compared

the self-concept of 42 educable mentally retarded (EMR) adolescents with 49 nonretarded adolescents attending a public high school. The Tennessee Self-Concept Scale was used as the measurement instrument. It was hypothesized that EMR adolescents would have significantly more negative self-concepts than nonretarded Ss. Significant differences were found for the variables of self-criticism, identity, social self, family self, and moral-ethical self scales. All differences were in the hypothesized direction.—*Journal abstract.*

3595. Cooperman, Warren L. (Northwestern U.) **Food as reinforcer for obese versus normals.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4306.

3596. Corey, Margaret J., Tischler, Bluma, & Sandercock, Joyce. (P. O. Box 111, Nackawick, New Brunswick, Canada) **Structural aberrations of autosomes in a mentally retarded population.** *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 487-498. —Discovered structural autosomal aberrations in 9 of 217 children in a school for the mentally retarded. These include 1 balanced Robertsonian translocation (involving 2 D group chromosomes); 1 translocation Down's syndrome; 2 ring G chromosomes; deletion of the short arms of a B chromosome; deletion of both short and long arms of an E chromosome; elongated short arms on a D chromosome (B-D translocation); elongated long arms of a B chromosome; and a complex rearrangement apparently involving deletions of both long and short arms of a B and elongated short arms on an E chromosome. Familial transmission was observed in 2 of 6 cases in which both parents were studied. All Ss had rare deviant dermatoglyphic patterns. With the exception of the balanced carrier, all had at least 3 clinical anomalies in addition to the mental retardation, although the number and severity of the defects varied.—*Journal abstract.*

3597. Das, J. P. (U. Alberta, Edmonton, Canada) **Vigilance and verbal conditioning in the mildly and severely retarded.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 253-259. —Administered to 34 mildly and 27 severely retarded adolescent institutionalized Ss a verbal conditioning task consisting of acquisition and reversal phases, and a simple and a complex vigilance task. Severely retarded Ss were slower in response speed than mildly retarded Ss in conditioning. They required a larger number of trials to change from acquisition to reversal phase, and from reversal to a reacquisition and rereversal phase; this was attributed to their relative immobility of nervous processes. In vigilance, both groups showed similar trends in decrement as a function of time at task. Severely retarded Ss were inferior to mildly retarded Ss in their performance in complex vigilance. False detections did not follow any consistent pattern of decrement in complex vigilance, which required some theoretical explanation. The most remarkable result was obtained by comparing good and poor performers in 1 vigilance task, on performance in the other vigilance task, and in conditioning. A direct variation between proficiency in vigilance and conditioning performances was noticed, as also between the 2 vigilance tasks. These relations are explained in terms of orienting response, which provided a basic link between vigilance and conditioning. (22 ref.)—*Journal abstract.*

3598. Dilley, George M. (Idaho State School & Hosp., Nampa) **Retarded women teach self-help skills.** *Hospital & Community Psychiatry*, 1969(May), Vol. 20(5),

154-155. 10 profoundly retarded women called "little sisters" were moved from their building into 1 which housed moderately and mildly retarded women. There each was given a "big sister," 10 "big sisters," or less retarded women, were moved to the building housing the profoundly retarded and given a "little sister." The little sisters who moved into the higher level building improved dramatically. The accomplishments of the little sisters who remained in their building, although not as striking, was significant.—B. A. Burkard.

3599. Duché, D. J., Hammer, N., & Tomkiewicz, St. **Tableau clinique et aspects psychologiques des arriérations mentales.** [Clinical notes and psychological aspects of mental retardation.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(11-12), 670-676.—Case records of 1513 children in 8 French hospitals with pediatric or child neuropsychiatric services were screened for evidence of severe mental retardation. Children with known brain pathology and those under 3 yr. of age when evidence of retardation was first noted were eliminated from the sample. Since test data were either unreliable or unattainable on many of the Ss, diagnosis of mental retardation was made on the basis of clinical descriptions and other nonpsychometric information. The result was a sample of 672 serious retardates: 132 were described as vegetative, 56 bedridden, 16 vegetative and bedridden, 214 ambulatory ineducables, 199 semieducables, and 55 of uncertain mental status because of physical-motor problems. 16.5% of the Ss showed visual defects, 62.1% had neurological problems, and a large but uncertain portion had auditory defects. Only 18% demonstrated mental retardation as their single symptom. Causality was uncertain, but it was estimated that in 6% of the Ss it was genetically determined, 11% resulted from rubella, toxoplasmosis, Rh incompatibilities, and other similar disorders occurring during the mother's pregnancy, 30% occurred postnatally, and 28% were unknown.—R. E. Smith.

3601. Fenz, Walter D. & McCabe, Michael W. (U. Waterloo, Ontario, Canada) **Habituation of the GSR to tones in retarded children and nonretarded subjects.** *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 470-473.—Studied habituation patterns of the GSR to auditory stimuli in 30 institutionalized retarded children and 30 8th grade nonretarded Ss. All children habituated to the 100- and 70 db tones but showed little change in response to the 35 db tones. At the 70 db change in response to the 35 db tones. At the 70 db intensity, control Ss had a greater initial response and responded throughout more strongly than retardates; the response to the 100-db tones was greater for the retardates.—*Journal abstract.*

3602. Fraser, William I. (Lynebank Hosp., Dunfermline, Scotland) **A retrospective and cross-sectional investigation of a deviant subcultural group.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 298-303.—Studied 513 behaviorally disturbed retarded and borderline-retarded males from a Scottish therapeutic community, retrospectively and by cross-sectional analysis 10 yr. after the community terminated. The patterns of prior crime appeared to be unaltered by the therapeutic environment, contrary to earlier claims. Subsequent offenders were recognizable by conduct in the hospital but not by historical antecedents, other than prior offenses. There was a spectrum of behavioral

symptomatology between the recidivist and nonrecidivist. The retardate required a stable adult figure after discharge with whom he could identify. (26 ref.)—*Journal abstract.*

3603. Galbraith, Gary C., Gliddon, Jack B., & Busk, Jytte. (Pacific State Hosp., Pomona, Calif.) **Visual evoked responses in mentally retarded and nonretarded subjects.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 341-348.—24 mentally retarded and 16 nonretarded Ss participated in the study. The visual evoked response (VER) was recorded from scalp electrodes placed over primary visual cortex and associative cortical fields. It was found that, in general, retardates showed: (a) significantly longer VER latencies, (b) failure to develop certain VER components, and (c) reduced amplitudes in the topographic distribution of VERs recorded over associative cortical fields. Findings generally support several postulates of retardate neural functioning derived from Gestalt field theory. (16 ref.)—*Journal abstract.*

3604. Gelman, Sheldon R. (Laurelton State School & Hosp., Pa.) **Admission groups for mentally retarded girls.** *Hospital & Community Psychiatry*, 1969(Jan), Vol. 20(1), 31-33.—Describes an orientation group established at Laurelton State School and Hospital, which serves mild to moderately retarded girls and women of child-bearing age, in order to help newly admitted students deal with the emotional impact of coming into the institution. The objectives were: (a) help the girls understand and accept the reasons for placement, (b) take some responsibility for making the best use of the program, (c) help them work through their feelings about being separated from their families, and (d) give them a chance to make friends. Each group met with a social group worker for an hr. twice a wk. for 3 wk. Training opportunities with the purpose of orienting the student toward leaving the institution are emphasized. After more than a year's experience, it is clear that the orientation group lacks effectiveness. 2 needs have been recognized: the need for a more integrated relationship with the families and community agencies responsible for placing the students, and the need for a more carefully planned process of rehabilitation.—*B. A. Burkard.*

3605. Goodstein, Henry A. (U. Connecticut) **Performance of mentally handicapped and average-IQ children on two modified cloze tasks for oral language.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 290-297.—Matched 22 public school educable mentally retarded (EMR) and 22 average-IQ children for MA (approximately 9.5 yr.) and reading age (approximately 8.6 yr.). Ss were administered 2 modifications of the cloze procedure that reflect 2 important processes in oral language: production and recognition. It was determined that (a) EMR Ss were significantly poorer than average-IQ Ss in cloze performance, and (b) the recognition cloze task was significantly easier than the production cloze task; no qualitative differences were found in the performance of the 2 samples. Results reflect inefficiencies in the organization and retrieval of linguistic stimuli of low-IQ children. Implications for potential language training programs utilizing cloze procedure are discussed. (15 ref.)—*Journal abstract.*

3606. Hashem, Nemat; Ebrahim, Assma, & Nour, Assma. (Ain-Shams U., Medical Genetics Unit, Cairo, Egypt) **Classical and atypical phenylketonuria**

among Egyptians: Study of 10 families. *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 329-335.—Studied 10 Egyptian families including 24 phenylketonuria (PKU) patients. Data indicate that the gene prevalence of classical PKU among Egyptians is .0067, with a carrier rate for the general population of 1 in 76. The finding of PKU Ss with normal intelligence is reported. 1 example of hyperphenylalaninemia with reduced intelligence presenting as atypical PKU is described. Dermatoglyphic findings for PKU patients are presented.—*Journal abstract.*

3607. Hogan, Donald D. (U. Michigan) **Cortical response of retardates for AER audiometry.** *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 474-477.—Obtained averaged auditory evoked responses (AER) from 15 retarded and motor-handicapped Ss and from 15 nonretarded Ss to investigate comparative responsiveness and response features. Analyses were conducted on the averaged response to 128 40-msec presentations of auditory signals of 1 kHz, 10-msec rise time, at each of 6 sensation levels—0, 10, 20, 30, 40, and 50 db. Significant findings are that the retardates exhibited detectable responses that were fewer in number and longer in latency than the responses of nonretarded Ss. The motor impairment of the retardates had no apparent influence upon the overall success of AER audiometry.—*Journal abstract.*

3608. Kershner, John R. (U. California, Los Angeles) **Intellectual and social development in relation to family functioning: A longitudinal comparison of home vs. institutional effects.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 276-284.—Tested 42 mentally retarded children before entering an institution and 1 yr. later on measures of social quotient (SQ) (Vineland Social Maturity Scale) and IQ (Stanford-Binet, Form L or Cattell Infant Intelligence Scale). Ss' families were pre- and postinterviewed to assess the adequacy of family functioning. 27 community-based families and their children who were of similar CA and IQ were compared. Family functioning, SQ, and IQ/SQ discrepancy were found to be related to family decisions to seek long-term residential placement. Community families and children showed decreases over the year on all measures taken, whereas institutional families tended to improve in functioning. In the community group, significant positive correlation was found between IQ decrement and family pre-posttest losses. In the institution group, significant negative correlation was found between low initial SQ and family increments in functioning. Results illustrate the important reciprocal relations existing between the retarded child and his family. (32 ref.)—*Journal abstract.*

3625. Thompson, Travis; Grabowski, John; Erickson, Eric, & Johnson, Roger. (U. Minnesota) *Development and maintenance of a behavior modification program for institutionalized profoundly retarded adult males*. *Psychological Aspects of Disability*, 1970(Nov), Vol. 17(3), 117-124.—A behavior modification program was based on positive reinforcement of adaptive behav-

ior and extinction (ignoring) of maladaptive behavior. Grossly disruptive and injurious behavior resulted in brief removal from the training area. There were no additional funding, staffing, or outside resources. Patient training was conducted by technicians having 5 hr. of classroom training in principles of behavior modification. Basic self-help skills (dressing, toileting, self-feeding) substantially increased, and grossly disruptive and injurious behaviors markedly decreased.—*Journal abstract*.

3626. Whalen, Carol K. & Henker, Barbara A. (U. California, Irvine) *Pyramid therapy in a hospital for the retarded: Methods, program evaluation, and long-term effects*. *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 414-434.—Describes a 9-mo hospital program with 5 16-24 yr. old female retarded "therapists" and 10 6-10 yr. old retarded "trainees." The program had 3 interrelated objectives: (a) extending the use of nonprofessional therapists to retarded patients in a hospital setting, (b) developing behavior modification procedures that could be taught to and used by mentally retarded persons, and (c) evaluating the effectiveness of this "therapeutic pyramid" approach. Children in 1 group were given 60 individual training sessions, then 60 play sessions; simultaneously, the matched control group was given play, then training. The training groups gained significantly in basic social behaviors over the play groups in each phase of the investigation. Children in the 1st play group also showed significant gains which were attributed to the general effects of participation in the program. Follow-up measures indicate that response acquisitions of the trainees and behavior modification skills of the therapists were durable. (18 ref.)—*Journal abstract*.

3627. Williamson, Malcom L. (U. Southern California) *Treatment effects on physical growth and mental development among phenylketonuric children*. *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2751.

3628. Zigler, Edward & Balla, David. (Yale U.) *Luria's verbal deficiency theory of mental retardation and performance on sameness, symmetry, and opposition tasks: A critique*. *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 400-413.—Discusses A. R. Luria's (see PA, Vol. 36:4GH48L) verbal deficiency theory of mental retardation and cites inconsistent empirical evidence relevant to this position. The findings of N. A. Milgram and H. G. Furth which concerned retarded-nonretarded differences on sameness, symmetry, and opposition tasks are examined. These findings, which have been interpreted as supporting Luria's formulation, are related to a number of methodological and conceptual issues relevant to verbal mediation theory, and are found to be open to alternative interpretations involving factors not included in Luria's formulation. (47 ref.)—*Journal abstract*.

Learning & Motor Ability

3629. Berry, Franklin M. & Baumeister, Alfred A. (Columbus Coll.) *Cue selection and meaningfulness in the paired-associates learning of retardates*. *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 456-462.—36 13-38 yr. old retardates acquired paired associates (PAs) consisting of a 2-verbal-element stimulus and a digit response (e.g., CAT and BWD: 0) after initial pretraining on the response terms. Transfer

tasks were employed to ascertain whether retardates utilized the more meaningful part of each compound stimulus for response evocation. Transfer data indicate that some retardates can be expected to select the more meaningful of 2 verbal cues for PA learning. (24 ref.)—*Journal abstract.*

3630. Donoghue, Elaine C., et al. (Fountain & Carshalton Hosp. Group, Queen Mary's Hosp. for Children, England) **Some factors affecting age of walking in a mentally retarded population.** *Developmental Medicine & Child Neurology*, 1970(Dec), Vol. 12(6), 781-792.—In a study of 336 severely retarded children (175 walking, 161 unable to walk), classified into 70 with Down's syndrome, 137 residual, and 129 with cerebral palsy, it was found that the number of walkers were, respectively, 56, 108, and 11 in these groups, with mean ages for starting to walk 3.2, 4.2, and 5.3 yr. Excluding cases of specific motor disability there is a relationship between age of walking and intelligence: all patients with IQ over 50 walked before 4 yr.; all who learned to walk after 7 yr. were profoundly retarded. Children with Down's syndrome who remained at home tended to walk earlier than those in an institution.—P. W. Pruyser.

3631. Lányi, Miklós. (Training School for Special Education, Budapest, Hungary) **A nyomon követő vizsgálatok szerepe az értelmi fogyatékos gyermekek fejlődési perspektívájának megítélésében.** [The role of tracking behaviour tests in predicting improvement in mentally defective children.] *Pszichológiai Tanulmányok*, 1967, No. 10, 641-645.

3634. Martin, Andrew S. & Tyrrell, Donald J. (U. Connecticut) **Oddity learning following object-discrimination learning in mentally retarded children.** *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 504-509. Presented 48 mentally retarded children with a 3-choice object-discrimination problem in which color or form was the relevant dimension. Ss were transferred to a 2nd object-discrimination problem or an oddity problem. The relevant dimension in the 2nd object discrimination was either the same as in training (intradimensional shift) or was that which was irrelevant during training (extradimensional shift). Similarly, the relevant vehicle dimension of the oddity problem was either relevant (intradimensional-oddity shift) or irrelevant (extradimensional-oddity shift) in training. The typical dimensional transfer effects were present in both the discrimination problem (intradimensional easier than extradimensional) and in the oddity problem (intradimensional-oddity easier than extradimensional-oddity). The latter findings are related to an extension of the D. Zeaman and B. J. House attention theory of discrimination learning.—*Journal abstract.*

3635. Prehm, Herbert J. & Stinnett, Raymond D. (U. Oregon) **Effects of learning method on learning stage in retarded and nonretarded adolescents.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3),

319-322.—Compared the learning performance of 60 educable mentally retarded and 60 intellectually-average adolescent Ss as a function of learning stage using a paired-associate learning task. 20 Ss within each group were randomly assigned to 1 of 3 methods of learning: the equal amount learned (EAL) method; the modified method of adjusted learning; and the method of adjusted learning. Analyses of variance indicate that (a) retarded Ss exhibited a deficit at each stage of learning (response learning and associative stages), and (b) the EAL method prolonged both the response learning stage and the stage of learning wherein the S consistently pairs correct stimulus and response items.—*Journal abstract.*

3636. Rydberg, Sven. (U. Stockholm, Sweden) **Beginning reading discrimination taught at IQ 35 by conditioning.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 163-166.—A simple conditioning method, using cards for control of attention, was tried out on 6 severely retarded children (CA, 6.4-15.11; MA, 2.11-4.3; IQ, 22-47). After 17 workdays the 3 "high-MA" Ss discriminated 8-10 words out of 10 and 9-10 words 24 and 48 days later (with 50-100% transfer to smaller, different print). "Low-MA" Ss retained 10-40% (40% for the 1 S without speech).—*Journal abstract.*

3637. Stephens, Beth; McLaughlin, John A., & Mahaney, Edward J. (Temple U.) **Ages at which Piagetian concepts are achieved.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 203-204.—Scores for 21 Piagetian assessments were available from a current longitudinal study on the development of reasoning in normals and retardates. Therefore it was possible to determine the MA at which Ss achieve successful performance on these measures. The random sample, 75 normal (IQ 90-110) and 75 retarded (IQ 50-75) Ss, was evenly divided into 3 age groups: 6-10, 10-14 and 14-18. Ss' responses were tabulated in terms of MA of attainment. Arbitrary criterion for concept attainment was 83% of Ss at a given MA. Discussion considers relation of stage to age.—*Author abstract.*

3638. Warren, Sue A. & Mondy, Lewis W. (Boston U.) **To what behaviors do attending adults respond?** *American Journal of Mental Deficiency*, 1971(Jan), Vol. 75(4), 449-455. Recorded the responses of 18 attending adults to more than 800 samples of behavior of 49 ambulatory institutionalized young retarded children. The attending adults usually failed to respond at all to either appropriate or inappropriate child behaviors. When responses were made to appropriate behaviors, they were likely to be encouraging, and thus were probably positively reinforcing. Responses to inappropriate behaviors were discouraging about twice as often as encouraging, providing potential positive reinforcement for unacceptable behaviors. For all behaviors, adult behavior appeared to offer children infrequent, variable ratio reinforcement schedules.—*Journal abstract.*

3639. Wright, Logan. (U. Oklahoma Medical Center, Oklahoma City) **Prerest performance levels of non-retardates and retardates, and reminiscence on manual crank task.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 304-308.—36 13-16 yr old male retardates with IQs from 61-78, and 36 14-15 yr old nonretarded students with IQs from 90-110 performed 20 10-sec manual crank trials which were interspersed by 10-sec ITIs. Following the 20th trial, Ss were provided a 3-min rest, followed by 10 postrest trials.

The rate of pretest performance for subgroups of 16 nonretarded and 16 retarded Ss was controlled. 2 other subgroups had no control exerted over their rate of cranking during the pretest period. On the 2nd group over which no control was exerted, nonretardates performed at a higher pretest level and showed more reminiscence. No differences were found between the reminiscence scores of nonretardates and retardates where level of pretest performance was controlled. Data support the notion that differences between nonretardates and retardates on reminiscence can best be explained by motivational factors which cause nonretardates to perform at a higher level of pretest performance, and thus build up greater amounts of reactive inhibition.—*Journal abstract.*

Training & Vocational Rehabilitation

3640. Cortazzo, Arnold D. & Runnels, Eugene J. (Sunland Training Center Miami, Fla.) One approach in rehabilitating the retarded. *Rehabilitation Literature*, 1970(Dec), Vol. 31(12), 354-360.—Presents the rehabilitation program at Sunland Training Center in Miami, a residential school for the retarded. Proceeding on the assumption that most current institutional programs are department—or profession—centered, a "new organizational model" is described which is program—or resident—centered. The novel feature of the plan involves elimination of the previous departmental structure in favor of 4 separate but interrelated program divisions: vocational rehabilitation, education and training, independent living, and development and training. These are further broken down into units of 4 cottages each. Each division is staffed by a program director, members of various professional disciplines, and subprofessional personnel, all of whom work completely in 1 of the division programs rather than in a specific department.—S. L. Warren.

PHYSICAL ILLNESS

3643. ———. Today's drugs. I. Narcotic analgesics. *British Medical Journal*, 1970(May), Vol. 2(5500), 125-126. Discusses the use of potentially addictive analgesics. Morphine still remains the principal drug of this kind. Narcotic analgesics are widely used for preoperative medication. Analgesics are used when labor has become established, pethidine being the most preferred choice. The pain of myocardial infarction usually requires a powerful analgesic. Its direction is the most desirable way of assessing the requirements of the patient. Intravenous pain of a noncardiac origin is never always best treated other than by narcotic analgesics.—S. R. Diamond.

3646. Casey, R. L., Thoresen, A. R., & Smith, F. J. (U. Washington Medical School) The use of the Schedule of Recent Experience Questionnaire in an institutional health care setting. *Journal of Psychosomatic Research*, 1970(Jun), Vol. 14(2), 149-153.—A questionnaire was administered to a group of trainees at a large military installation to determine the life change units (LCUs) accumulated during the 12 mo. prior to active duty. Medical records of all Ss were then reviewed after 7 wk. of training. No significant relationship was found between LCU scores and illness occurrence. However, the LCU score was found to be related to the level of health care attained.—W. G. Shipman.

3647. Clark, T. J., & Cochrane, G. M. (Guy's Hosp., London, England) Effect of personality on alveolar ventilation in patients with chronic airways obstruction. *British Medical Journal*, 1970(Jan), Vol. 1(5691), 273-275.—Studied the personality of 44 patients with chronic airways obstruction (using the Eysenck Personality Inventory), this being related to the difference between their observed PVCO₂ and that predicted from their forced expired volume. This was designed to test the hypothesis that those patients with a lower mixed venous CO₂ tension (PVCO₂) than predicted were the more extroverted. Results show a significant correlation between extroversion and the departure of PVCO₂ from prediction. Those patients having a lower PVCO₂ than predicted were more extroverted than those with a PVCO₂ higher than predicted. There was no correlation between neuroticism and the PVCO₂. Results support the hypothesis that the personality of a patient may play an important part in determining the alveolar ventilation found in patients with chronic airways obstruction. Patients known as "pink puffers" could more appropriately be named "pugnacious pink puffers".—*Journal abstract.*

3648. Enke, Helmut. (Ulm U., Div. of Medicine, Sociology, & Social Psychology, W. Germany) Regressive Tendenzen des Patienten im Krankenhaus [Regressive tendencies of the hospitalized patient]. *Fortschr. der Psychotherapie*, 1970(Oct), Vol. 18(5), 210-226. The purpose of medicine is both to heal and to rehabilitate the hospitalized patient to facilitate his reintegration into society. The regression of the patient is a social problem. Psychotherapists have been asked to take part even in the planning of hospitals. Before psychotherapy can accept this task, however, the process of regression and the settings of the hospital situation have to be examined. Regression does not occur independently but is related to the ability of the ego to experience an inner questionable reality. The inner structure of the hospital institution reflects the maturity and social competence of those working there. The hospital institution has lost the already authoritative position of the doctor. More sociological and sociomedical studies reveal a great dependency of the patient upon the doctor. The real problem, therefore, is not the regression of the patient.

3660. **Varni, J. G., et al.** (U. Washington) **Psychophysiological correlates of anisocoria.** *Journal of Psychosomatic Research*, 1970(Jun), Vol. 14(2), 195-201.—2 studies were conducted to determine if anisocoria is related to other clinical states besides ocular tension and aberration. The results of both studies suggest that bilateral differences in the diameter of the 2 pupils, anisocoria, is associated with distinctive thermoregulatory responses. (27 ref.)—*W. G. Shipman*.

COMMUNITY SERVICES

3661. **Ananth, J. V.** (Montreal General Hosp., Quebec, Canada) **Night Center.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 252-257.—Night Center is a useful treatment facility which can treat people who are minimally disturbed and still capable of working. With increased community mental health services and early detection of cases, more night center facilities will be needed by the community. There may be more need for these centers in big cities where there are large numbers of solitary individuals. Further research is needed regarding the utility of this form of treatment facility.—*D. Prager*.

3662. **Brown, George W.** (Lovelace Clinic, Albuquerque, N.M.) **The diagnosis and treatment of children with learning and developmental problems: A community service for medical group practice.** *Rehabilitation Literature*, 1970(Aug), Vol. 31(8), 234-238, 243.—Presents the staff composition and methods of the Lovelace Clinic, in Albuquerque, a large medical clinic (75 physicians and other doctoral level staff) which provides diagnostic and treatment services for families and children with significant learning disabilities or developmental problems. A team approach is used in which the psychologist is an essential contributor to the diagnostic process (testing) as well as the therapeutic program (family counseling, educational planning, play therapy, intensive psychotherapy, etc.). The need for careful diagnostic studies before undertaking remedial educational or medical programs is stressed.—*S. L. Warren*.

3663. **Crossley, B. & Denmark, J. C.** (Bolton & District Group of Hosp., Townleys Branch, Farnworth, England) **Community care: A study of the psychiatric morbidity of a Salvation Army hostel.** *British Journal of Sociology*, 1969(Dec), Vol. 20(4), 443-449.—To assess the degree to which declining occupancy of mental hospitals might reflect discharges not accompanied by adequate aftercare or facilities, the psychiatric morbidity of residents in a Salvation Army hostel was assessed. The facility chosen for the study was a full-board hostel with accommodations for 60 long-stay residents. Over a 4-mo period 55 residents were asked if they could be interviewed, 51 consented (of the remaining 4, 3 appeared to the psychiatrist to be psychotic). Of those who consented to being interviewed 35 were between the ages of 25-65; 30 were single (the remainder being separated, divorced, or widowers); the median length of stay in the hostel fell in a 1-5 yr. category; 26 would have

preferred alternative accommodations. All men were interviewed several times, and according to diagnostic criteria identical to those used in the local psychiatric outpatient clinic, 10 were diagnosed as schizophrenic (7 of these had previously been hospitalized) and 33 were considered to be suffering from personality disorders (10 had been previously hospitalized). These findings indicate that patients who still need therapeutic care are being discharged into the community. *K. G. Shaver*.

3664. **Elwell, Richard N.** (State Dept. of Mental Hygiene, Albany, N.Y.) **Hospitals and centers move toward a single system of comprehensive services.** *Hospital & Community Psychiatry*, 1969(Jun), Vol. 20(6), 175-179.—Uses 3 major concepts: continuity of care, community locus, and comprehensive services to examine how the development of new community mental health centers will affect the traditional services of state mental hospitals. 100 applications for staffing grants for new mental health centers are reviewed. 17 were located in service areas that also contained a state mental hospital. In 62 cases, the hospital was some distance from the center's catchment area. 21 were government mental health facilities. In only a few instances did the center applications ignore either the needs or the possible contributions of the state hospital. Findings "indicate that unless a state hospital wants to limit its role to providing specialized or long term treatment, it will have to develop a geographic unit." There must be considerable activity by the individual hospital and the individual center to establish an alliance.—*B. A. Burkard*.

3665. **Hartog, Joseph.** (U. California, Dept. of International Health, San Francisco) **Transcultural aspects of community psychiatry.** *Mental Hygiene*, 1971(Jan), Vol. 55(1), 35-44.—The 3-part model of consultant, intermediary consultant, and client consultee is applied to the transcultural aspects of community psychiatry. Varieties of cross-cultural problems are presented exemplified by the author's experience in Malaysia and in an area of San Francisco. Problems include barriers to verbal, nonverbal, stylistic, and value-bound communications, as well as failure to recognize contributions of the recipient community. Suggests 5 ways to minimize cross-cultural barriers in the context of community psychiatry. (15 ref.)—*Journal abstract*.

3666. **Huessy, Hans R.** (U. Vermont, Medical School) **Satellite halfway houses in Vermont.** *Hospital & Community Psychiatry*, 1969(May), Vol. 20(5), 147-149.—Several types of halfway facilities including foster homes, private halfway houses, boarding homes, and a community hotel constitute an informal satellite system radiating from the state's 1st halfway house, Spring Lake Ranch, which was established in 1932. Residents are called guests and no matter where they live, someone from the ranch is always available to them. "We have become convinced that for many of our guests a psychiatrist has little to offer beside supervision of medication, and that the social living situation is the most important therapeutic factor." All halfway facilities are operated by nonprofessional people. "It seems to us that private enterprise offers a greater incentive to establishing varied facilities than does direct government or agency control."—*B. A. Burkard*.

3667. **Kalmans, Ethel T.** (Mental Health Center, Day Treatment Center, Arlington, Va.) **Low-cost individualized treatment in a day center.** *Hospital & Com-*

munity Psychiatry, 1970(Dec), Vol. 21(12), 394-397.

—Day care programs for psychiatric patients can serve to shorten hospitalization, to reintegrate former hospital patients into community life, and even to avert hospitalization. In the day treatment center of the Arlington, Virginia, mental health center, length of time a patient may remain in the program is not limited. Some patients use the program as a temporary phase of treatment before resuming work or family responsibilities, others attend for prolonged support. The day program includes 14 staff members, 3 of whom are fulltime. Staff consists of psychologists, psychiatric nurses, workshop instructors, a special education teacher, a psychodramatist and dance therapist, an art therapist, and an aide. Activities include individual, group and family psychotherapy, work therapy, psychodrama, art and dance therapy, community meetings, and adult education. Workshops are also available for both men and women patients, and each patient is paid for the work he does, according to its quality and quantity. Family members are urged to keep in contact with the staff. Potentials for expansion, including evening and weekend programs, programs involving older children and other family members are discussed.—R. B. Sivley.

3668. Kvarnes, Robert G., Rittelmeyer, Louis F., Schneider, Irving, & Taylor, Barbara O. (Washington School of Psychiatry, D.C.) **The associated facilities program in community psychiatry.** *Hospital & Community Psychiatry*, 1970(Feb), Vol. 21(2), 62-64.—Describes a program developed by 12 psychiatric teaching institutions for continuing education in the field of community psychiatry. The 1st-yr program consists of a seminar in crowd and group phenomena, social determinants of individual behavior, and laboratories of behavior as exemplified by war and poverty. The 2nd concentrates on community dynamics and methods for psychiatric intervention. A practicum is required for final certification in the program. Activities, trends, and developments are outlined.—S. Knapp.

3669. Neufeldt, Aldred H. (Saskatchewan Dept. of Public Health, Saskatoon, Canada) **Electronic information programs: A multiple-facility system.** *Hospital & Community Psychiatry*, 1970(Jan), Vol. 21(1), 1-6.—Describes an electronic data-processing system designed to develop information about a community psychiatric program. Information about the identity, social characteristics, type of treatment, diagnosis, and case history are stored within the system. The system enables the community to keep track of highly mobile patients, and provides information for research into such areas as patterns of multiple admissions.—S. Knapp.

3670. Reid, Kenneth E. (Western Michigan U., School of Social Work) **Community mental health on the college campus.** *Hospital & Community Psychiatry*, 1970(Dec), Vol. 21(12), 387-389.—A promising approach to student mental health is said to lie in the community as a mental health concept. By viewing the campus as a community whose population consists of students, faculty, and administration, a continuum of mental health services may be structured, aimed at primary, secondary, and tertiary prevention. Primary prevention is directed toward identifying and counteracting harmful circumstances that produce mental disorders in students. Secondary prevention would consist of early diagnosis and treatment to reduce the prevalence of emotional disturbance on the campus. Tertiary prevention would include rehabilitation measures, returning the student to

productivity as soon as possible to reduce the residual effects of emotional illness.—R. B. Sivley.

3671. Reinhold, John E. (U. Pennsylvania) **Use of formal psychological and psychiatric services in relation of the position accorded them in the social system.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3049.

3672. Scheidlinger, Saul; Struening, Elmer L., & Rabin, Judith G. (125 Woodbine Ave., Larchmont, N.Y.) **Evaluation of a mental health consultation service in a ghetto area.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 485-493.—Assesses the findings of a mental health consultation program that operated for over 4 yr in a Puerto Rican and black section of New York City. 21 directors of various agencies affiliated with this service were questioned as to their estimation of the value of the program, whether they found it helpful, and what changes, if any, should be made. Results of the Ss rated indicate that the consultation staff was considered to be qualified to teach about matters relating to their background but not about subjects like "militancy." Data suggest that the majority felt the program had worth and asked that it be continued.—C. O'Donnell.

3673. Schwartz, Donald A. (U. California, Medical School, Irvine) **Community mental health: An under-view.** *Psychiatric Quarterly*, 1970(Apr), Vol. 44(2), 333-358.—"The overall mission of community mental health may be summed up as follows: alteration of the social system within which society promotes mental health for all its citizens and responds to mental illness in some of them." Prominent problems of community mental health are those of general and special education, of political and social forces of administration, and of technical and clinical methodology.—D. Prager.

3674. Valeros, Jose A. & David, Anne C. (Avenida Libertador 1750, Buenos Aires, Argentina) **On the theory of community psychiatry.** *Psychiatric Quarterly*, 1970(Apr), Vol. 44(2), 281-295.—Discusses philosophical and psychological issues of community psychiatry to contribute to its definition and clarify aspects of its internal structure. The internal community is the internal environment in which object relations take place. It should be experienced as nonhuman and separate from the self. In a pathological internal community, qualities of the relationships are negatively transferred to the internal community which then becomes pathological. The applications of these concepts are in community psychiatry rather than in the formal aspects of practice. (4) ref.—D. Prager.

3675. Whittington, H. G. (Dept. of Health & Hosp., Denver, Colo.) **The police: Ally or enemy of the comprehensive community mental health center?** *Mental Hygiene*, 1971(Jan), Vol. 54(1), 55-59.—The community mental health center should be involved with the protective force in selection and training of police officers in preparation for facilities for study and treatment of disordered behavior in community psychiatry, and in consultation concerning social problems.

GERIATRICS

3676. Butler, Robert N. (Washington School of Psychiatry, Washington, D.C.) **Directions in psychiatric treatment of the elderly: Role of perspective of the life cycle.** *Geriatrics*, 1970(Nov), Vol. 65(11), 134-138.—Outlines the relevances of nursing homes and Medicare in meeting the needs of the aged and the

lack of professional interest in geriatrics. It is not known "to what extent normative, modal features of the life cycle account for the varying patterns of change and adaptation we see . . . We believe the life cycle itself, or the changes inherent in the rhythm of the life cycle itself, makes some contribution to the variability." Our present rites of passage are seen as obsolete and lead to problems, i.e., generation gap, transmission of power, and inability to cope with the numbers of retired individuals. Possible future solutions for many related problems based on an adequate knowledge of life cycles might include liberalized abortion, trial marriages, endocrine replacement, euthenasia, and biological control. In the present, psychotherapy must concern itself with grief and restitutional processes in the elderly. Life cycle features offer the therapist general guidelines for useful treatment. Ongoing research is described and 2 illustrative case histories are presented.—*S. Knapp.*

3677. **Cautela, Joseph R.** (Boston Coll.) **A classical conditioning approach to the development and modification of behavior in the aged.** *Gerontologist*, 1969(Sum), Vol. 9(2, Pt. 1), 109-113.—Describes procedures developed from Pavlovian classical conditioning studies and behavioral therapy for treating the aged. 3 major areas are distinguished in the behavior of the aged: (a) low behavioral output, (b) faulty learning and retention, and (c) feelings of rejection and eminent death. A Reinforcement Survey Schedule, developed to determine the values of various stimuli as reinforcers for individual patients, is described. Results from this scale may be used to develop behavior modification programs. In the learning situation, paced learning utilizing programed teaching with strong CS and UCS is considered especially effective in obtaining well conditioned responses. Stimulants may facilitate learning, but caution is recommended due to paradoxical drug effects sometimes noted in the aged. Learning task anxiety, feelings of rejection, and preoccupation with death are treated with the behavioral therapy techniques of relaxation, desensitization, and thought stopping. (25 ref.)—*S. Knapp.*

3678. **Ciampi, L. & Muller, C.** (U. Lausanne, Psychiatric Clinic, Switzerland) **Katamnestiche Untersuchungen zur Altersentwicklung psychischer Krankheiten.** [Catamnestic examinations in connection with old-age developments of mental illnesses.], 1969(Aug), Vol. 40(8), 349-355.—Reports on an extensive catamnestic research program covering the old-age developments of former mental patients of the Psychiatric University Clinic of Lausanne, who are now over 65 yr. old. The excellent Swiss records made it possible to check on 5661 cases, of whom more than 800 survivors could be clinically reexamined. The cases included depressive, hysteric, toxicomanic, and epileptic cases. Most cases showed an alleviation of dramatic mental decomposition features in old age. In many cases, a change of the symptoms into less striking residual features could be observed. The dynamics of these developments are believed to be connected with a decline of driving powers, due to advanced age. The life expectancy of epileptics and organic or endogenous depressive types is significantly shorter compared with the population average. (25 ref.)—*P. von Taal.*

3679. **Hacker, Sally L. & Gaitz, Charles M.** (Baylor U., Medical School) **The moral career of the elderly mental patient.** *Gerontologist*, 1969(Sum), Vol. 9(2, Pt. 1), 120-127.—Utilized the concepts of E. Goffman (see

PA, Vol. 34:3268) to study the elderly mental patient. 36 out of 110 patients admitted to a county psychiatric screening ward were studied after 1 yr., and next of relation for 59 were interviewed. 2 key elements in the careers of these Ss were examined: betrayal by next of relation and defensibility of self. Few Ss had any part in their own commitment and betrayal was a common experience. Once within the ward, diagnosis and disposition were carried out with little information supplied to either patient or relative. It is noted that whether an elderly patient remains in the hospital is frequently dependent on his outside resources rather than on psychiatric reasons. Inpatients and expatients were evaluated on the Affect Balance Score of a measure of psychological well-being. Expatients scored significantly better than inpatients due to the frequency of negative feelings in the latter group. Inpatients were bored, lonely, and depressed. Criticisms which upset them came from deflation of the self, and pleasure was derived from staff compliments on their dependent behavior. Ss were not actively discredited; they were not credited to begin with.—*S. Knapp.*

3680. **Shapiro, Alex.** (Montefiore Home, Cleveland Heights, O.) **A pilot program in music therapy with residents of a home for the aged.** *Gerontologist*, 1969(Sum), Vol. 9(2, Pt. 1), 128-133.—Describes the therapeutic use of music in the treatment of the aged. Individual case histories were evaluated and methods in which music therapy might be useful were established. Socialization between various nationality-culture groups was accomplished in the group participation. Assignment of a rhythm instrument to each patient on the basis of his physical needs and preferences helped to relieve some of the stiffness of arthritis, encouraged muscular movements, and led to personal satisfaction. Exercises in conducting provided exercise for the larger arm muscles, encouraged leadership and self-confidence, and provided a release of tensions. Ear training provided exercises to improve the patient's memory and concentration. Playing the electronic organ provided mental and physical stimulation. Group song therapy enabled the patients to analyze the lyrics of selected songs and indirectly to verbalize their anxieties and hostility. Positive evaluations of the program by the staff are presented.—*S. Knapp.*

3687. Levinthal, Charles F., Lansky, Leonard M., & Andrews, O. Ernest. (U. Michigan) **Student evaluations of teacher behaviors as estimations of real-ideal discrepancies: A critique of teacher rating methods.** *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 104-109.—Ratings imply comparative judgments between the values of the O and his observations, e.g., a student's ratings of his teacher are estimates of the discrepancy between the student's ideals for the teacher's behavior and what he sees the teacher do. Most methods for collecting teacher ratings make assumptions about ideals and about the discrepancies between ideals and observed behavior. To assess the relevance of direct measurement of ideals, 263 undergraduates rated a teacher and reported their ideals for the teacher's behaviors. Judgments of ideal behavior varied across Ss and items. Interactions between ideals and observed responses were noted. New approaches to teacher ratings are recommended.—*Journal abstract.*

3688. Long, K. Kilby. **Transfer from teaching to learning.** *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 167-178.—Examined transfer from teaching to learning in a paired-associate learning procedure. 20 undergraduates in an initial experiment and 105 undergraduates in an extended replication served as Ss. Serving as an E was found to have a beneficial effect on subsequent learning. A number of control conditions failed to produce any postexperimental effect, which suggests that the specific "teaching" experience accounted for the effect. In particular, 1 control which required teaching silent Ss failed to produce a reliable effect on subsequent learning. This finding is discussed in terms of the importance of learning to utilize feedback in the teaching-learning process. (18 ref.)—*Journal abstract.*

3689. Marchal, Gaston L. **A propos d'une nécessaire psychopédagogie de l'esthétique.** [Toward a necessary psychological teaching of esthetics.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(9-10), 560-574.—The advancement of mankind is inconceivable without the development of all of the potentials of man for expression. The goal of progressive education today is the development of these potentials through human principles, laws of social evolution, new modes of action, and adaptation to life. Psychology must begin to attack and systematized teaching of the disciplines and emphasize philosophical principles over scientific principles. —R. E. Smith.

3690. Markle, Susan M. & Tiemann, Philip W. (U.

Illinois, Office of Instructional Resources, Chicago) **"Behavioral" analysis of "cognitive" content.** *Educational Technology*, 1970(Jan), Vol. 10(1), 41-45.—Examines the cognitive approach of J. S. Bruner and the operant conditioning approach of B. F. Skinner to learning, and attempts to blend the 2 into a model for educational practitioners. The model combines the cognitive idea of conceptual learning as an information gathering game and the operant conditioning idea of effective techniques for eliciting responses to stimuli. To produce understanding (the ability to generalize and discriminate), the teacher must select a "special rational set of examples and non-examples, based on an analysis of the concept in the real world of subject experts." When the student can discriminate between these examples, he is then tested with another set to determine if generalization has occurred. If he is successful, real understanding may be considered to have occurred.—S. Knapp.

3693. Rothbart, Myron; Dalfen, Susan, & Barrett, Robert. (U. Oregon) **Effects of teacher's expectancy on student-teacher interaction.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 49-54.—Constructed a simulated classroom situation with 13 female university seniors and 52 high school students. Teacher trainees discussed academic material with 4 students, 2 of whom were arbitrarily designated as "lacking in intellectual potential." Measures were obtained of (a) the amount of attention given to the high- and low-expectation students, (b) the amount of verbal and gestural encouragement (reinforcement) allocated to high- and low-expectation students, (c) the amount of talking done by high- and low-expectation students, and (d) the teacher's evaluation of both groups of students. It was found that teachers were more attentive to high-expectation students, but directed the same amount of reinforcement to both groups. Students in the high-expectation group talked more, presumably as a consequence of the teacher's greater attention. Teachers evaluated the low-expectation students as less intelligent, as having less potential for future success, and as having a higher need for approval.—*Journal abstract.*

3694. Sahlin, Clarence J. (Indiana U.) **An analysis of the writings of Erich Fromm and their implications for adult education.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2674-2675.

3695. Sampson, Carlene E. (U. Arizona) **The school psychologist's contribution to the improvement of reading.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2747-2748.

3696. Schraml, Walter J. **Psychanalyse et éducation: Problèmes de la pédagogie psychanalytique.** [Psychoanalysis and education: Problems of psychoanalytic pedagogy.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(11-12), 649-658.—Understanding of the origins

of neurosis and related mental aberrations and the ability to help students avoid situations leading to these disorders should be an important part of the educator's knowledge. The educator should be aware of the cultural influences on his students, their needs for successful experience, their search for identity, problems in the control of aggression, and alternatives to punishment as a means of behavioral control. Processes of sublimation, diversion, and direction of aggressive impulses are discussed, and methods of dealing with adolescent identification problems are offered.—*R. E. Smith.*

3697. Stewart, Lawrence H. (U. California, Berkeley) **A non-metric procedure for combining criterion groups.** *California Journal of Educational Research*, 1970(Nov), Vol. 21(5), 208-215.—Explored a method for combining variables in order to identify the nature of the psychological continua underlying such variables. The data from an interest assessment test was used in this approach. It is concluded that a researcher who does not have a well-defined rationale for forming a priori groups might then use a method like the one explored in this study for grouping similar data.—*H. J. McWhinnie.*

3698. Wash, James A. (West Georgia Coll., Carrollton) **Some psychological bases for educational technology.** *Educational Technology*, 1970(Jan), Vol. 10(1), 17-18.—Outlines the requirements of the learning experience. The structure necessitates that the student and the environment be considered as 1 entity. "The learning system must provide for stimulus definition and control, reinforcers, feedback systems, and deducible consequences." It is considered essential that feedback be provided at each level of learning, rather than at the end, so that appropriate behaviors are reinforced. The learning environment must provide impetus to generalization and real problems to be solved in order to sustain student effort and interest.—*S. Knapp.*

3699. Werts, Charles E. & Watley, Donivan J. (Educational Testing Service, Developmental Research Div., Princeton, N.J.) **A student's dilemma: Big fish—little pond or little fish—big pond.** *National Merit Scholarship Corporation, Research Reports*, 1969, Vol. 5(3), 14 p.—The relative deprivation theory of J. A. Davis (see PA, Vol. 41:1879) postulates that attending a highly selective college adversely affects motivation for graduate study because students usually obtain relatively poorer grades than they would have at a less selective college; the poorer grades leading to a relatively low self-evaluation of their intellectual capacity for graduate study. Alternatively, the environmental press theory of D. L. Thistlethwaite and N. Wheeler (see PA, Vol. 40:4598) posits that motivation for graduate study is increased by attending a highly selective college because the environmental press favors advanced study. A logical model for testing the contrasting predictions of the 2 theories and some preliminary evidence favoring the relative deprivation theory are presented. (16 ref.)—*Journal abstract.*

3700. Werts, Charles E. & Watley, Donivan J. (Educational Testing Service, Developmental Research Div., Princeton, N.J.) **Analyzing college effects: Correlation vs. regression.** *National Merit Scholarship Corporation, Research Reports*, 1969, Vol. 5(2), 15 p.—In studying college effects, an input-output model is commonly used in which student input is controlled by using regression analysis to compute an "expected" output. The part correlation of the college environment variable and the output with input variance removed

only from the output is interpreted as a measure of the college effect. However, this is not the most useful procedure that may be used since part (or partial) correlation may severely underestimate the magnitude of the true college effect. Interpreted within a causal model, partial regression coefficients appear to be a generally more satisfactory measure of college effects and to have greater stability across different units of measurement. 4 models are used to illustrate the advantages of using partial regression coefficients in a causal framework. (18 ref.)—*Journal abstract.*

3701. Wing, Cliff W. & Wallach, Michael A. (Duke U.) **College admissions and the psychology of talent.** New York, N.Y.: Holt, Rinehart, & Winston, 1971. ix, 165 p.—After listing 4 options—meritocratic, random, explicit favoring of disadvantaged applicants, and open—in the field of admissions, detailed merits of each are presented. Cases demonstrating use of the Scholastic Aptitude Test are presented. 4 chapters explore the meaning of "talent," and 4 chapters present original research. (42 ref.)—*A. M. Cawley.*

3702. Anderson, Richard C., Kulhavy, Raymond W., & Andre, Thomas. (U. Illinois) **Feedback procedures in programmed instruction.** *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 148-156.—Presented 356 undergraduates in 2 experiments a programmed lesson on the diagnosis of myocardial infarction. The experiments were conducted using a computer-based instructional system which insured that S responded before he received knowledge of the correct response (KCR). Ss who received KCR after they responded learned significantly more than Ss who received no KCR or who could peek at KCR before they responded. Neither 2 versions of a time-out procedure, a correction procedure, nor a forced-return procedure improved on KCR after responses. KCR after wrong answers only was slightly better than KCR after right answers only. Review of incorrect frames failed to improve performance on either an immediate or delayed criterion test. (28 ref.)—*Journal abstract.*

ATTITUDE & ADJUSTMENT

3703. Alker, Henry A. & Closson, Michael B. (Cornell U.) **Admission standards, institutional racism and black student political participation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 397-398.—This study falsifies for 1 historically salient case the hypothesis that lower admissions standards account for increased Negro student protest. Our data suggest, on the contrary, that low scores on admissions predictors are irrelevant. Rather it is students high on a traditional admissions standard, Scholastic Aptitude Test-Verbal, who, if they subsequently receive low grades in college, are politically active. Some evidence concerning the causal direction of this relation involves poor academic performance in talented Negro students prior to their political participation.—*Author abstract.*

3706. DeVries, David L. & Ajzen, Icek. (U. Illinois, Center for Social Organization of Schools) **The relationship of attitudes and normative beliefs to cheating.** *Journal of Social Psychology*, 1971(Apr), Vol. 83(2), 199-207.—Previous research on cheating in college has centered on the relation between biographical variables, e.g., religiosity, GPA, sex, etc., and the evidence of cheating. An attempt was made to predict cheating intentions and self-reports of actual cheating from attitudes toward such behavior (A-act) and normative beliefs (NBs) about it, based on a theoretical model proposed by M. Fishbein. 146 undergraduates served as Ss. The biographical indices showed little or no relation to amount of cheating. In contrast, cheating intentions and self-reports of cheating correlated highly and significantly with the predictors in Fishbein's model (A-act and NBs). Findings support the predictive power of the model under consideration.—*Author abstract.*

3710. Gordon, Leonard V. (State U. New York, School of Education, Albany) **Weber in the classroom.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 60-66.—Describes an instrument designed to measure the "bureaucratic personality," based on the Weberian model, from the 6th to the 12th grade level, using the school as the environmental frame of reference. The Student Environmental Preference Schedule (SEPS) was compared to the previously developed adult Work Environmental Preference Schedule (WEPS). The WI-PS and SEPS forms were found to be constructually comparable. The SEPS was significantly related to other personality variables in directions congruent with bureaucratic theory. Bureaucratic attitudes as measured by the SEPS decreased monotonically with increasing grade level, and were related negatively to intelligence and academic achievement and positively to favorableness toward a traditional school environment. Similar findings in India and Japan are noted. (25 ref.) *Journal abstract.*

3714. Pirot, Michael & Mallory, C. Eugene. (Whittier

Coll.) **Method versus attitude in student centered teaching.** *Psychology*, 1970(Nov), Vol. 7(4), 32-37.—Attempted "to determine the relative effects of teaching method and teachers' attitude on student attitudes toward their teachers, his teaching method, and the class-group itself." 7 sections with 55 college students in each, were each led by a teaching assistant. Attitudes were measured by Rogers' Relationship Inventory. Teaching method was measured by 2 forms of a Teaching Inventory, the Teacher and Student forms. Teachers were divided into those who were most directive and those most nondirective in method and attitudes "to match the 4 teacher models implied in the hypotheses." Results suggest "that the Teaching Inventory was stable and that students did not detect significant changes in teachers' methods over the period of the experiment." Rogers' "theoretical ideas about the intra method and teacher attitude in establishing 2 types of learning situations seems to be given some empirical support by the present study."—S. Knapp.

3726. Feldman, Solomon E. & Sullivan, David S. (Northern Illinois U.) **Factors mediating the effects of enhanced rapport on children's performance.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 302.—Tested 72 elementary schoolchildren matched by grade, sex, and Otis IQ on the even numbered items of the Test Anxiety Scale for Children (TASC). 1 wk. later Ss completed a short form of the WISC, a motivation battery, and the remainder of the TASC under enhanced and standard rapport conditions. Enhanced rapport consisted of friendly conversation and verbal reinforcement for the 1st correct response on each WISC subtest. Ss in enhanced rapport showed significantly higher WISC IQs, better motivation scores, and more verbal productivity. Enhanced rapport was more effective with the older Ss. Enhancement did not produce lower TASC scores, but while Ss performed equally under enhancement, low-anxious Ss scored significantly better on the WISC than high-anxious Ss in the standard condition. It is concluded that the higher IQs observed in the enhanced rapport condition are the result of the E's friendliness and reinforcement of verbal productivity.—*S. Knapp.*

3727. Fleischman, Howard L., Orr, David B., & Strasel, H. C. (Scientific Educational Systems, Inc., Falls Church, Va.) **The relationship between the sub-tests of six achievement test batteries.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 109-110.—Determined in 2 studies the feasibility of equating the reading subtests and the arithmetic subtests of the most frequently used achievement test batteries at the 4th, 5th, and 6th grade levels. The purpose of these studies was to investigate the construct congruity of the tests. Correlations were computed among the reading and arithmetic tests. Although the tests were not perfectly correlated, results

indicate that the tests were sufficiently congruent to support the equating procedure. It is concluded that it would be feasible to conduct equating studies for the 2 sets of tests studied here.—*Author abstract.*

3728. Landis, Dan; Hayman, John L., & Hall, William S. (Educational Testing Service, Princeton, N.J.) **Multidimensional analysis procedures for measuring self-concept in poverty area classrooms.** *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 95-103.—Reports an attempt to apply the individual differences multidimensional analysis procedure of L. R. Tucker and S. J. Messick (see PA, Vol. 38:4865) to the description of self-image. 487 4th grade Ss in 16 poverty area classrooms were administered an instrument in which 12 critical concepts were presented by the method of complete triads. After interconcept distance estimates were obtained, the data were subjected to the Tucker and Messick procedures. 3 factors were obtained, representing subgroups of the 16 classrooms. Within each group, the number of concept dimensions varied from 3-4. Tentative interpretations of each concept dimension are presented. Implications and feasibility of the method in large scale evaluation programs are discussed. (20 ref.)—*Journal abstract*

3729. McLeish, John. (Inst. of Education, Cambridge, England) **The rating scale as a measure of college environments.** *Research in Education*, 1969(May), No. 1, 72-86.—Tested 2 null hypotheses: (a) "that the members of a complex social system are incapable of forming a general, consistent and valid concept of the total system"; and (b) "that rating scales are invalid as measuring instruments because of the inequality of units, this inequality becoming apparent when the scales are reversed in direction or in number-description association." In 2 studies, 4 different forms of a rating scale were completed by 62 and 72 male and female students, tutors, and college administrators over a 4-wk period. It was found that the order of presentation did not significantly effect the results, although movement across the body did produce a slight effect. The scatter of responses and ratings remained constant. Significant differences were found between course groups due to the student's tendency to identify course tutors with the institution. Students were more positive in their attitudes than the tutors. Considerable anxiety was found in both students and tutors during the exercise. It is concluded that "the rating scale is an appropriate instrument for many purposes but that it is unsuited as a method of establishing an objective view of a complex social system as this is experienced by participants."—*S. Knapp.*

3730. Meuwese, W. (Technical U., Eindhoven, Netherlands) **Toeassing van steekproefvrije itemanalyse op vorderingentoetsen.** [Application of sample-free item analysis on achievement tests] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970-(Oct), Vol. 25(9), 585-593. Investigated, in 2 experiments, the applicability of Rasch's sample-free item-analysis model on achievement tests. In Exp. I, score-to-ability transformation curves were obtained on groups which differed in average ability. The curves proved to be very similar. Distributions of ability estimates obtained on tests maximally different in difficulty were not significantly different in mean and standard deviation. In Exp. II, 2 randomly chosen groups of Ss were measured on tests differing in difficulty. Easiness estimates of the easy test were transformed to the easiness scale of the difficult test.

Differences between groups in cumulative distribution were not larger than can be expected by chance when both groups are measured on the same test.—*English summary.*

3731. Niccoli, Pietro. L'impiego del G.A.T.B. per l'orientamento nelle 3^e medie. [The use of the GATB for orientation in the 9th grade.] *Bollettino di Psicologia Applicata*, 1969, No. 91-93, 59-76.—Studied the results of using the 7 sections of the General Aptitude Test Battery (GATB) which test mental aptitude, as a replacement for the Differential Aptitude Test (DAT). The GATB evaluates the following: (a) intelligence, (b) verbal aptitude, (c) mathematical aptitude, (d) spatial aptitude, (e) form perception, and (f) office work perception. The GATB, it is concluded, can be used effectively, because it can be administered in a short time, by itself or with other tests, and has various applications.—*A. M. Farfaglia.*

Observed body movement in the college test-taking situation and scores on the Scholastic Aptitude Test. *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 265-266.—In undergraduates, the greater observed body movement in the test-taking situation was significantly related to lower verbal Scholastic Aptitude Test (SAT) scores. Observed movement did not, however, relate significantly to either math SAT scores or test anxiety as measured by the State-Trait Anxiety Inventory. Furthermore, the negative observed movement-verbal SAT relationship was not mediated by test anxiety.—*Journal abstract.*

3734. Srikanthiah, N. Y. (U. Mysore, India) Standardisation of an achievement test in algebra. *Psychology Annual*, 1970(Mar), Vol. 4, 36-39.—Constructed and standardized an algebra achievement test for 9th and 10th grade children. 120 Ss participated in preliminary tests of the form. A test of the final 110-item form was made with 460 students in 9 city high schools. Results were compared with midsession examination marks. Correlation was significant at the .01 level. Significant grade, sex, and socioeconomic differences were revealed in the test.—*S. Knapp.*

3735. van Naerssen, R. F. (U. Amsterdam, Psychological Lab., Netherlands) Itemgewichten afhankelijk van de ruwe score. [Items weights which depend on raw score.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Oct), Vol. 25(9), 604-614.—Describes 3 methods by which test items can have a larger weight in the area in which they discriminate. In the 1st method, the item counts if the p value of a 4-choice test is larger than some linear function of the raw score of the person. In the 2nd method, a minimum and a maximum p value can be calculated graphically for each raw score by a model in which a linear function was postulated between the "proportion of item right" and the percentile score on the test. The position of the linear line is a function of the p value. The part in which the item counts is the nonhorizontal part of the line. In the 3rd method, the item-test regression, the probability of "item right," given the raw score, provides a maximum of 1 with a minimum of 0. The 3 methods were tested by 4-choice tests but the utility was small. It is

suggested that the values obtained by the use of any of the 3 methods was trivial in comparison with the ease of lengthening the test to secure equivalent reliability. (English summary)—*A. J. Ter Keurst.*

3738. Haring, Norris G. (U. Washington, Child Development & Mental Retardation Center) The new curriculum design in special education. *Educational Technology*, 1970(May), Vol. 10(5, Pt. 2), 24-31. Identifies influences, discusses developments, and presents examples of new curriculum design in the field of special education. Behavioral research is described as contributing to the definition of objectives, early identification, management, and modification of handicapping behaviors. Educational technology is described as providing the means to the objectives through individualized instruction using programmed materials, instrumentation, systems analysis, and automated and nonautomated media. 3 important features of the new design are discussed: (a) the teacher as a manager designing, implementing, and evaluating systematic arrangements of cues for the development of academic skills; (b) the selection and arrangement of materials and media to cue responses; and (c) the decisions on instructional conditions based on a continuous record of performance. Although great variations are noted in the application of behavioral research and educational technology, it is concluded that the "best curriculum design in special education will incorporate both dimensions of technology to the fullest." Remedial Education

3740. Blank, Marion; Higgins, Thomas J., & Bridger, Wagner H. (Albert Einstein Coll. of Medicine, Yeshiva U.) Stimulus complexity and intramodal reaction time in retarded readers. *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 117-122. Examined the possible role of stimulus differences in the reported difficulty of cross-modal RT in retarded readers. Using an intramodal paradigm involving a simple and a complex visual stimulus, 20 retarded 3rd grade readers were found to have significantly longer RTs than 20 normal 3rd grade readers. The pattern of response was similar for both reading groups in that the complex stimulus both initially caused more difficulty than the simple stimulus and led to difficulty in shifting to the

subsequent stimulus. Findings suggest that poor cross-modal performance cannot be attributed to deficiencies in cross-modal perception but may depend upon the extent of the physical differences that exist between the stimuli, whether within or across modalities.—*Journal abstract.*

Emotional Disorder

COUNSELING & GUIDANCE

3758. Athanasiou, Robert. (Johns Hopkins U.) Selection and socialization: A study of engineering student attrition. *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 157-166. Conducted an 18 mo cross-validated panel study of virtually an entire class of engineering students. Data from 713 undergraduates consisted of responses to a comprehensive questionnaire and the Omnibus Personality Inventory. Change scores on indexes of professional and educational interests, self-perception, and authoritarianism were found to be better predictors of attrition than either initial or final index scores. Attrition from engineering was defined by transfer to another field of study within the university. Changes on each index followed the predicted pattern of accentuation with high scores getting higher and low scores getting lower. The small differences, at entrance, between Ss who stayed in engineering and Ss who transferred, and the rather large differences at exit, suggest that early identification (or selection) programs might not be as effective as changes in the socializing environment in reducing engineering student attrition. (23 ref.)—*Journal abstract*.

3763. Blaker, Kenneth E. & Bennett, Roger W. (U. Santa Clara) Behavioral counseling for elementary-school children. *Elementary School Journal*, 1970(May), Vol. 70(8), 411-417.—Reports 5 successful experiments in the use of behavior modification in an elementary school. 2 disruptive 4th graders selected a classmate with exemplary behavior. The model observed and repeated positive behavior which was rewarded with soda pop. 7 4th and 5th grade boys were given 20 cards and for each act of disruption, lost a card. Ss with the most cards left at the end of the week were rewarded. Checks on a card for good behavior and cards lost towards were used for modifying the behavior of all over the 2nd grade boys known for his rudeness. At entry into 3rd grade, the boy was improved by reinforcing good behavior in specified areas with poker chips and rewarding the whole class with a free period for receiving the maximum points in a week. Ss were taught to overcome their shyness by discussing a film of a shy child and practicing class participation. Prizes were given for Ss who were most successful in changing 2 variables are discussed as being critical to the success or failure of the modification process: creativity in the choice of reinforcements, and positive attitude toward the technique.—S. Koenig.

3772. Elton, Charles F. (U. Kentucky) **Interaction of environment and personality: A test of Holland's theory.** *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 114-118.—Tested J. L. Holland's assumption that personality variables interact with environment. The following hypotheses were investigated: (a) for males who leave engineering ($n = 27$) there is a personality change different from that found among those who remain in engineering ($n = 25$); and (b) for males who leave or remain in engineering, the personality development is different from that of males in a 2-yr college ($n = 22$). Analysis of Omnibus Personality Inventory scores indicates that 2 dimensions represented differences between groups: intellectual independence and practical inclination. Transfers to arts and sciences from engineering became more realistic, nonjudgmental, intellectual, liberal, and skeptical of orthodox religious beliefs. 2-yr students showed greater variability in their personality change scores and a loss in their liking for reflective and abstract thought. Results tend to support Holland's theory of vocational development.—*Journal abstract*.

3773. Ensign, Gordon B. (Washington State U.) **An experimental application of selected reinforcement procedures to the development of effective study schedules among academically deficient students.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2682.

3785. Meichenbaum, Donald H. & Goodman, Joseph. (U. Waterloo, Ontario, Canada) **Training impulsive children to talk to themselves: A means of developing self-control.** *Journal of Abnormal Psychology*, 1971(Apr), Vol. 77(2), 115-126.—Examined the efficacy

of a cognitive self-instructional (SI) training procedure in altering the behavior of impulsive school children. Study I, with 15 2nd graders, employed an individual training procedure which required the impulsive child to talk to himself, initially overtly and then covertly, in an attempt to increase self-control. Results indicate that the SI group improved significantly relative to attentional and assessment control groups on the Porteus Maze Test, performance IQ on the WISC, and on a measure of cognitive impulsivity. The improved performance was evident in a 1-mo follow-up assessment. Study II, with 8 kindergartners and 7 1st graders, examined the efficacy of the components of the cognitive treatment procedure in altering the impulsive child's performance. Results indicate that cognitive modeling alone was sufficient to slow down the impulsive child's response time for initial selection, but only with the addition of SI training was there a significant decrease in errors. Treatment and research implications of modifying S's cognitions are discussed. (45 ref.)—*Journal abstract.*

Paolicchi, Piero. **Risultati dell'applicazione di un questionario di interessi professionali su un gruppo di adolescenti.** [The results of the application of a questionnaire of professional interests to a group of adolescents.] *Bollettino di Psicologia Applicata*, 1969-(Aug), No. 94-96, 123-143.—Studied the professional interests in a group of adolescents. 435 13 yr. olds were given the following tests: (a) Raven's Progressive Matrices to determine the level of general intelligence. (b) Thurstone's Factorial Battery of Primary Mental Attitudes, (c) 16 PF, (d) Brainard's Occupational Preference Inventory, and (e) a personal outline for the essential facts of family and scholastic character. The averages of interests in various fields were the following: 9.3%, sciences; 8.4%, business; 4.3%, mechanics; 3.4%, liberal and professional arts; 17%, services; and 9%, agriculture. It is concluded that (a) the individual profiles resulting from Brainard's questionnaire appear to be in relationship with a whole series of factors, some of which correspond to social or individual variables; and (b) an important problem for the analysis of interests is the type of relationships which exist between the personality and the wider sociocultural system of which it is a part. Within the 1st group of students, their fears were due to a revival of old Oedipal emotions, of a libidinal as well as of an aggressive type, under pressure. With the 2nd group of fear syndromes, an examination is subconsciously evaluated as a narcissistic menace: the loss of the respect of professors (idealized parent-teacher images) is feared. The chances for a successful treatment are good for both groups. In many cases, an analytically oriented psychotherapy, centered on the problems of the examination, seemed to be curatively sufficient. Some general psychohygienic problems arising from examination situations are discussed (16 ref.) P. von Tsall.

P.A.R.I. [Education specialist: Follow-up analysis in the evaluation of the educative attitudes evaluated by the PARI.] *Bollettino di Psicologia Applicata*, 1969(Aug), No. 94-96, 25-34.—Compared the profile of Ss qualified as educators on a professional level and Ss who act as educators without specific technical or professional qualification. 61 professional educators and teachers (17-30 yr. old) were given the Parental Attitude Research Instrument (PARI). Their educational backgrounds ranged from trade school to graduate school. A previous contribution on this matter by S. Valeschini whose study included only qualified educators is cited. The present study is a follow-up and also shows how the examined Ss differed. 10 out of 23 attitudes are similar to those of the group of education specialists studied previously. It is concluded that the education specialists present a profile of attitudes which differs from others of the same sociocultural status but who have not had specialized training, and thus, are not qualified although they may be actually employed as such. The PARI is valuable in discriminating among those who wish to be educators without experience or preparation and those who have such experience and training. The profile of the education specialist represents a generic psychological attitude of an educational nature.—*A. M. Farfaglia*.

Valeschini, Silvio. **L'educatore specializzato: Contributo alla conoscenza del profilo professionale attraverso lo studio e la rilevazione di alcuni atteggiamenti caratteristici al P.A.R.I.** [The education specialist: Contribution to the knowledge of the professional profile by studying some attitudes characteristic to the PARI.] *Bollettino di Psicologia Applicata*, 1969(Aug), No. 94-96, 13-23.—Studied the personal attitudes of the educator toward some general problems of education. It is the attitude of the educator which qualifies and distinguishes him rather than his personality or his role. The Parental Attitude Research Instrument (PARI) of Schafer and Bell was given to 44 education specialists. 5 groups of attitudes are included: (a) suppression and interpersonal distance, (b) hostile rejection of the housemaking role, (c) excessive demand for striving, (d) overpossessiveness, and (e) harsh punitive control. Except for the 2nd group, these groups can be successful in studying the attitudes of common educational interests. There is another character profile to aid in the selection of education specialists, but the real educational attitudes are not established. It is concluded that the PARI is a better guide in the selection of education specialists.—*A. M. Farfaglia*.

Texas) **A comparison of characteristics of prospective secondary school teachers enrolled in two different degree programs.** *California Journal of Educational Research*, 1970(Nov), Vol. 21(5), 204-207.—If "warmth" may be defined as measured attitudes toward children, then this study concluded that prospective teachers of English enrolled in a College of Education do in fact have warmer and more positive attitudes towards children than do similar teachers of English trained in a College of Arts and Sciences. While this finding was true for English teachers, it was not true for teachers of social sciences. It was suggested that the study ought to be replicated with more diverse subject matter areas. The data did not say that holders of a bachelor of science degree in secondary education made more effective teachers than liberal arts graduates, but the data do indicate that such graduates are not to be necessarily preferred over College of Education students.—*H. J. McWhinnie*.

3815. Soucar, Emil. (Temple U.) **Vigilance and the perceptions of teachers and students.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 83-86.—Data were obtained on a measure of cognitive differentiation from 70 teachers and 66 nonteachers. Teachers were more differentiating in their perceptions of their disliked students and nonteachers were more differentiating in their perceptions of their disliked instructors. As predicted, in neither sample were disliked persons significantly more differentiated by females than males. Male nonteachers were more differentiating of both liked and disliked instructors while no such sex difference was found for the teacher group. It is suggested that sex differences occurred when superior persons were being rated. Males are probably more threatened by authority figures (instructors) than are females. Consequently males would be more attentive to the personal characteristics of their instructors. These findings are discussed in relation to the "vigilance" hypothesis suggested by H. Miller and J. Bieri (see PA, Vol. 39:14065) and M. Irwin, T. Tripodi, and J. Bieri (see PA, Vol. 41:7245).—*Journal abstract*.

3816. Steward, Judith R. & Love, W. A. (Nova U., Ft. Lauderdale, Fla.) **The teacher's response to technology and the individualization of instruction.** *Educational Technology*, 1970(Feb), Vol. 10(2), 56-61.—Studied the attitudes of 123 teachers in an innovative school dedicated to individualized instruction. Each S completed a 12-item Teacher Opinion Questionnaire and ranked 5 definitions of individualized instruction according to importance. Results reveal (a) a high level of job satisfaction, (b) that loss of teacher status was not considered significant, and (c) that the extra effort required of the teacher was considered worthwhile and creative. Ss also reported a considerable amount of role confusion and indicated the need for additional training in innovative techniques and guidance. Many Ss felt that the teacher should not be responsible for preparing his own curriculum material. Ranking of components of individualized instruction revealed strong agreement that many paths be available to the student to reach an objective at his own rate. A new emphasis is noted on the role of the teacher in assisting the student in his personal and academic development.—S. Knapp.

SCHOOL LEARNING & ACHIEVEMENT

3818. Anderson, Richard C. & Myrow, David L. (U. Illinois, Training Research Lab.) **Retrospective inhibition of meaningful discourse.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 81-94.—Investigated retrospective inhibition with prose passages in 2 ex-

periments involving 297 high school students. In each case, retrospective inhibition was observed where consecutive passages entailed similar stimuli and competing responses while retroactive facilitation appeared where the passages involved both similar stimuli and similar responses. Previous failures to find retroactive inhibition with prose are attributed to the mixing of test items, some of which were facilitated, some of which were inhibited, and some of which were unaffected. Results match expectations from interference theory fairly closely, except that multiple-choice items were more subject to retroactive inhibition than short-answer items, suggesting that response competition is a more important factor than response unavailability in retroactive inhibition with prose. 3821. Burgdorf, Kenneth. (National Inst. of Mental Health, Section on Personality, Bethesda, Md.) **Outstanding Negro high school students: A one year followup.** *National Merit Scholarship Corporation Research Reports*, 1969, Vol. 5(4), 12 p. 1 yr. after their expected date of graduation from high school, the 4288 participants in the 1st National Achievement Scholarship Program for outstanding Negro students filled out a questionnaire dealing with their college experiences. Data were analyzed to assess the extent to which the program accomplished its dual objectives of encouraging talented Negro students to attend college and of encouraging colleges to seek talented Negro students. Results indicate that Ss in the higher competition status groups were (a) more sought after by the colleges, (b) more successful in college entrance, and (c) had more nonacademic achievements. Most differences were small, not because Ss in the higher groups did poorly, but because Ss in the lower status groups did well. A followup of a random group of nonrespondents to the original followup indicates that sampling bias in the original followup acted to depress competition status group differences, but not substantially.—*Journal abstract*

3823. Cutler, Sheldon & Palmer, Richard J. (Indiana U.) **Social reinforcement, individual difference factors, and the reading performance of elementary school children.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 97-104.—Studied the relationships among contingent social reinforcement, sex, test anxiety, achievement, and the reading performance of 120 4th-6th grade children on a series of matched paragraphs. It was hypothesized that Ss' social reinforcement histories and expectancies for success and failure would mediate the Ss' responsiveness to reinforcement and their acquisition of correct reading responses. Results indicate that reinforcement and the individual difference factors significantly interacted to

affect reading performance. The performances of boys were more variable and, compared to girls, more highly related to test anxiety and achievement level and significantly more influenced by social reinforcement factors. Girls made significantly fewer errors than boys over trials, with sex differences accentuated by high test anxiety and attenuated by negative reinforcement. It is concluded that elementary school girls were more task oriented than boys, more innerdirected, and less dependent upon extrinsic motivational factors. (19 ref.)—*Journal abstract.*

3831. Hermans, H. J. & Coopmans, J. J. (Roman Catholic U., Nijmegen, Netherlands) **Onderzoek naar de relatie tussen de attitude van de leerkracht en enige persoonlijkheidskenmerken van de leerling.** [The relationship between the teacher's attitude and some personality characteristics of the student.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Oct), Vol. 25(9), 562-584.—Studied the following variables in the investigation of teaching power and personality characteristics of pupils: (a) school achievement, (b) intelligence, (c) discrepancy between Variables a and b, (d) achievement motive, (e) debilitating and (f) facilitating anxiety, (g) social desirability, and (h) the democratic and (i) the nondemocratic approach of the teacher. Variables a and b were measured by the Interesse Schoolvorderingen Intelligentie test Serie; Variables d-g were measured by the Prestatie Motivatie Test; and Variables h and i were measured by a questionnaire. Ss were 261 boys and 177 girls in the 5th and 6th grades. The criteria were "pleasure in study" and grades. Pleasure in study had a

high +r with Variable d and very low r's with Variables a and b. Grades had a high +r with Variables a and b, and a moderately high r with Variables d, e, and f. Variable h had a positive influence on the achievement of girls, but a negative one on that of the boys. Among girls, Variable e was higher and Variables f and g were lower in classes when the teacher had a strong democratic approach. (English summary) (18 ref.)—A. J. Ter Keurst.

3832. Jenkins, Joseph R. & Deno, Stanley L. (U. Delaware) **Influence of knowledge and type of objectives on subject-matter learning.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 67-70.—Combined 2 experimental variables (type and knowledge of objectives) in a 2 x 3 factorial arrangement of treatments. 112 undergraduates were randomly assigned to 1 of 6 experimental conditions or a learning control condition. The objectives used were either general or specific (type) and were provided either to teachers only, to teachers and Ss, or to Ss only (knowledge). Although significant learning occurred for all instructed conditions compared to a test-only control, neither knowledge of the objectives nor type of objectives differentially influenced performance on a criterion test.—*Journal abstract.*

3834. Katz, Leonard & Wicklund, David A. (U. Connecticut) **Simple reaction time for good and poor readers in grades two and six.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 270.—A recent experiment in high-speed visual scanning demonstrated that differences between good and poor readers existed in intercept but not slope of response latency as a function of the size of the scanned set. The present experiment in simple RT was designed to test the hypotheses that the intercept difference was due to a difference between good and poor readers in (a) the RT to the target's onset (i.e., the detection of and response to a stimulus change), and/or (b) in the efficiency of the motor portion of response execution. 2nd and 6th graders were run. Although differences in RT between grades appeared, no differences between good and poor readers were observed; alternative hypotheses based on memory retrieval are postulated.—*Author abstract.*

3835. Katz, Leonard & Wicklund, David A. (U. Connecticut) **Word scanning rate for good and poor readers.** *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 138-140.—Presented 20 5th grade poor readers and 19 good readers with a series of trials in which 2 successive slides were shown. The 1st slide contained a single word. The 2nd slide contained either 2 or 3 words which comprised either (a) a grammatical, meaningful sentence, or (b) a scrambled version of a grammatical sentence. Ss were instructed to respond "yes" or "no" depending on whether the 1st slide word did or did not appear on the 2nd slide. Although poor readers were about 250 msec slower than good readers, both groups had equivalent scanning rates. RT to the 3-word sentences was about 100 msec slower than RT to the 2-word sentences, for both groups. The absence of effects due to grammaticality and the absence of an interaction between sentence length and "yes" vs. "no" suggests that Ss in both groups used a rapid exhaustive perceptual scan. It is concluded that the differences

observed between good and poor readers cannot be caused by differences in the transformation and matching process.—*Journal abstract.*

Genoa, Inst. of Psychology, Italy) **Prime indagini sulla efficienza nella lettura e scrittura in soggetti "normali" di la elementare.** [First studies on the efficiency in the reading and writing of normal 1st grade subjects.] *Bollettino di Psicologia Applicata*, 1969(Aug), No. 94-96, 35-53.—Studied the capabilities of normal Ss as a preliminary study to the reasons of the difficulty in learning to read and write. 62 1st grade classes with an average IQ of 105 were given tests which gave importance to the various aspects of the ability in reading and writing, e.g., a short story of 85 words, and a dictation of 24 words. Ss that (a) had scholastic difficulty and were repeaters, (b) were mentally deficient or highly gifted, (c) sensorial impairment or speech defects, (d) were left handed or ambidextrous, or (e) were discipline problems were excluded. The remaining Ss were divided into 3 groups: children of blue collar workers, office workers, and professionals. The comparison of the 3 sociocultural groups did not produce any significant difference regarding speed or frequency of errors on the tests. Few errors were made on the various parts of the reading and writing tests, e.g., 55% did not make more than 2 errors on a part involving the reading and comprehension of isolated words.—A. M. Farfaglia

3843. Robinson, Peter S. (U. Utah) **Some effects of listening to speeded speech on the listening and reading behavior of sixth grade boys.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3714.

3844. Rohwer, William D., Ammon, Mary S., Suzuki, Nancy, & Levin, Joel R. (U. California, Inst. of Human Learning, Berkeley) **Population differences and learning proficiency.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 1-14.—Examined the hypothesis that school-achievement deficiencies of low-socioeconomic-status black children are attributable to corresponding deficiencies in learning ability. 288 low-socioeconomic-status black and high-socioeconomic-status white children from 3 grade levels (kindergarten, 1st, and 3rd) were sampled. The Peabody Picture Vocabulary Test (PPVT), Children's Progressive Matrices, and 4 paired-associate measures were administered. Results reveal large population differences on the PPVT and the Children's Progressive Matrices at all grade levels, the largest difference being between the 3rd grade samples. In contrast, the paired-associate measures reveal a population difference only at the kindergarten level. (34 ref.)—*Journal abstract.*

3845. Sloan, Jack L. (State U. New York, Albany) **A multivariate study of individual differences among teachers and pupils for a specific instructional unit.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2748.

3846. Weinstein, Rhona & Rabinovitch, M. Sam. (Yale U.) **Sentence structure and retention in good and poor readers.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 25-30.—Investigated whether syntactic structure facilitates recall in good readers, and whether this effect exists in children who are poor readers. 26 good and 15 poor readers were selected from the 4th grade of 3 Canadian public schools. A paired-associate task equated the 2 groups on their ability to associate simple, familiar words. Each S learned (with a tape recorder) 4 lists composed of nonsense elements and grammatical markers: 2 were syntactically structured, and 2 unstructured. The good readers learned the structured lists more rapidly than the unstructured lists. The poor readers learned both kinds of lists with equal difficulty. There was no difference between the good and poor reader's ability to retain the unstructured material. It is concluded that the locus of the facilitation effect lies in the syntactic cues, implicit in the structured list. (16 ref.)—*Journal abstract.*

3852. Rychlak, Joseph F. & Tobin, Thomas J. (Purdue U.) **Order effects in the affective learning styles of overachievers and underachievers.** *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 141-147. —Tested the predilection to learn positively rated trigram materials more efficiently than negatively rated materials. 64 high school males were identified via GPA and IQ as overachievers, underachievers, above average, and below average students. Ss learned 2 lists of paired-associate trigrams, 1 of which had been rated as liked by the S and 1 which he had rated as disliked (unmixed lists). The overachiever showed the least disparity between positive and negative reinforcement value, and the underachiever showed the greatest reinforcement value effect. Learning disliked lists before liked led to uniformly positive nonspecific transfer for all Ss, whereas learning liked before disliked materials did not clearly facilitate transfer. (20 ref.)—*Journal abstract*.

CURRICULUM & PROGRAMS

3853. Barber, Lucie W. (State U. New York, Albany) **The relation of dogmatism to decision-making behavior in twelfth-grade high school students.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2729.

3854. Bronzo, Anthony F. (U. California, Los Angeles) **Changes in prejudice and cognitive behavior in high school students as a function of instruction.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2607.

3855. Busch, John C. (U. Tennessee) **Conformity in preschool disadvantaged children as related to field dependence, sex, and verbal reinforcement.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4305-4306.

3856. Ebel, Robert L. (Michigan State U.) **The curriculum and achievement testing.** *Educational Technology*, 1970(May), Vol. 10(5, Pt. 2), 22-23.—Examines concerns commonly expressed over the use of external tests of achievement. These involve beliefs that (a) teachers do not know enough about the contents of the tests to enable them to "teach to" the test, (b) the test makers are expert teachers and the amount of curriculum control which the test exercises may be of value, (c) the tests do foster some degree of uniformity across schools but this does not need to limit creative curricular innovations, (d) only poor teachers will resort to undesirable teaching techniques, and (e) the school's major task is the fostering of cognitive competence which is what the tests seek to measure. The role of achievement tests in curriculum evaluation is discussed. It is concluded that achievement tests may be very useful to the curriculum specialist if wisely used, but that their limitations, especially in the area of curriculum evaluation, must be acknowledged.—S. Knapp.

3857. Filloux, Jean C. **Pédagogie et groupe.** [Teaching and groups.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(9-10), 502-511.—Presents Parts II and III

of a workbook for a seminar in the sciences of education, University of Nanterre, France.—R. E. Smith.

3858. Frieder, Brian. (Kirschner Assoc., Inc., Albuquerque, N.M.) **Motivator: Least developed of teacher roles.** *Educational Technology*, 1970(Feb), Vol. 10(2), 28-36.—Outlines and describes O D PRIME, a total system of learning situation events, consisting of (a) formulation of objectives, (b) diagnosis of instructional needs, (c) prescription of instructional activities, (d) instruction, (e) motivation, and (f) evaluation of achievement. The least developed and most neglected of these components is considered motivation. Contingency management as a technique for motivation is described. 10 rules of contingency contracting are presented and illustrated: (a) reward immediately, (b) reward small approximations, (c) reward frequently with small reinforcers, (d) reward accomplishment rather than obedience, (e) reward performance after it occurs, (f) be fair, (g) be clear, (h) be honest, (i) be positive, and (j) be systematic. The interaction of motivation with the other components of the teaching situation is described. It is concluded that a teacher trained as a motivation manager can significantly improve learning.—S. Knapp.

3860. Griffin, Alice. (U. Manchester, England) **Selective and non-selective secondary schools: Their relative effects on ability, attainment and attitudes.** *Research in Education*, 1969(May), No. 1, 9-20.—Investigated the effects on students of different types of school organization in grammar and secondary modern schools (selective) and comprehensive schools (nonselective). 568 14-15 yr. old children from 3 comprehensive, 3 grammar, and 6 secondary modern schools were selected in the county of Staffordshire, England. Verbal reasoning, English attainment, and IQ tests given in the 11+ yr. served as a base. Ss were tested again in the 4th year of secondary education and completed 5 attitude tests: a 25-item attitude toward school test, 3 multiple-choice opinion statements on the status of the school and in the community, their own and parents opinions of the school, and age they wished to leave school. Results indicate that (a) comprehensive schools provided a stimulating environment for children of all abilities; (b) little difference was present in English attainment between the 3 types of school; (c) brighter pupils expressed better attitudes toward school in comprehensive than in grammar schools, particularly for girls; (d) girls of average and below average abilities in secondary modern schools also had positive school attitudes; and (e) comprehensive school organization had a unifying effect on morale and appeared to strengthen the holding power of the school. (17 ref.)—S. Knapp.

3864. Levenstein, Phyllis & Levenstein, Sidney. (Family Service Assn. of Nassau County, Freeport, N.Y.) **Fostering learning potential in preschoolers.** *Social Casework*, 1971(Feb), Vol. 52(2), 74-78.—Since 1965, the Verbal Interaction Project, has explored a new means of preparing 2- and 3-year-old children of low-income families for the good school achievement vital to breaking the cycle of poverty. The method encourages dialogue between mother and child. The project is based on research evidence that a child's intellectual development is closely linked to his verbal growth and that his mother can influence his cognitive development by the amount and quality of her verbal interaction with him. Results confirmed the ability of the project to raise significantly the initially relatively low mean verbal and general IQs of these children over controls.—*M. W. Linn.*

3865. McCormick, Clarence C. & Schnobrich, Janice N. (Developmental Achievement Center for Children & Adults, Niles, Ill.) **Perceptual-motor training and improvement in concentration in a Montessori preschool.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 71-77.—25 children in a morning class of a Montessori preschool were administered a program of perceptual-motor training which stressed control of impulsiveness and development of attentional skills. 24 children in the afternoon class were controls. All Ss were administered a battery of psychological tests prior to training and again 7 mo. later at the termination of the training. All Ss (both groups) exhibited a mean 12-13 point gain in Peabody Picture Vocabulary Test IQ and a mean 13-14 point gain in Draw-a-Person Test IQ. In addition, experimental Ss exhibited mean gains on the Auditory-Vocal and Visual-Motor Sequential subtests of the Illinois Test of Psycholinguistic Abilities and in Ego-Control scores of the Arrow-Dot Test. Controls showed no such gains. It is concluded that the perceptual-motor training program might supply a useful adjunct to the regular Montessori curriculum. (27 ref.)—*Journal abstract.*

3868. Parker, Harry J., Sternlof, Richard E., & McCoy, John F. (U. Texas, Southwestern Medical School, Dallas) **Objective versus individual mental ability tests with former Head Start children in the first grade.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 287-292.—To determine if individual or objective mental ability tests provide more accurate information with culturally deprived children when they reach primary grades, the Science Research Associates' Primary Mental Abilities (PMA) Test K-1 was administered in the 1st grade to 62 former Head Start white and Negro boys and girls. The Columbia Mental Maturity Scale, Goodenough Draw-a-Man Test, and Vineland Maturity Scale were administered 6 mo. earlier. On the PMA, significant differences were found for Verbal Meaning,

Number Facility, and Total Score for the 4 groups, with scores for whites higher than for Negroes. White boys exceeded girls on all subtests, while Negro boys exceeded Negro girls except on Total Score. Perceptual Speed scores were elevated beyond other scores for all but white girls. Whites exceeded Negroes by an average of 9 mo. on the PMA, while on the Columbia Mental Maturity Scale the difference was 13 mo. Subject to the users' understanding of the PMA, it appears to be reasonably applicable for use with ethnic and culturally deprived groups in primary grades and could serve as an alternative to individual mental ability testing.—*Journal abstract.*

3869. Reale, Paola. **Verifica di un servizio di preorientamento effettuato con materiale stampato e tecniche audiovisive.** [Verification of a preorientation service brought about with printed material and audiovisual techniques.] *Bollettino di Psicologia Applicata*, 1969(Aug), No. 94-96, 91-109.—Defines "preorientation" as informative action to high school students concerning scholastic subjects and possible work resources. A center of scholastic and professional orientation organized a preorientation program in the following way: (a) direct contact with the boards of education in both cities and provinces to specify the type and goals of the program; (b) a calendar sent to principals including dates when specialists from the center would be at different schools; (c) talks by social assistants to students and parents and distribution of the "Guide to Scholastic and Professional Careers"; and (d) documentary film presentation. It is concluded that this work by the center has resulted in an increase of information regarding scholastic organization. Regarding the techniques which were used, there was a greater increase of information if the group also received audiovisual material.—*A. M. Farfaglia.*

3870. Soares, Louise M. & Soares, Anthony I. (U. Bridgeport) **A study of the interpersonal perceptions of disadvantaged children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 261-262.—Measured the self-perception and interpersonal ratings of disadvantaged children enrolled in a special summer program developed for improving their reading and arithmetic skills both before and after the program. It was found that they increased self-images in 3 dimensions—self concept, reflected self-parents, and ideal concept. The teachers' and parents' ratings of them also increased significantly. A most interesting result was the almost identical mean score of self-concept and parents' ratings both for the pretest and the posttest. Yet the students thought their parents (and teachers) would rate them higher than they actually did. The teachers' ratings were very much lower.—*Author abstract.*

3871. Stanford, H. J. (Trent U., Peterborough, Ontario, Canada) **Design of a course in educational psychology.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 104-109.—Describes the design of a course in educational psychology by 20 teachers registered for the course. The seminar format adopted by the teachers is discussed, and a brief outline of the 12 subject areas covered is presented. It is concluded that when such applied courses are being considered, the opinions of professionals in the area may be at least as valuable as surveys of teaching techniques.—*R. Wilt.*

3874. Williams, Frank E. (Macalester Coll., Creativity & National Schools Projects) Models for encouraging creativity in the classroom by integrating cognitive-affective behaviors. *Educational Technology*, 1969-(Dec), Vol. 9(12), 7-13.—Discusses the theoretical basis and educational uses of 4 models of cognitive-affective behavior: (a) J. Piaget's stage theory of intellectual development, (b) B. S. Bloom's taxonomy of the cognitive domain, (c) D. R. Krathwohl's taxonomy of the affective domain, and (d) J. P. Guilford's structure of intellect model. A new model, an outgrowth of the Guilford model, is presented which is designed for use by the teacher in encouraging creativity in young children. Dimension 1 of the cube model lists subject matter, Dimension 2 lists 18 teaching strategies, and Dimension 3 lists 4 cognitive and 4 affective pupil behaviors. Use of the model in curriculum planning, teacher instruction, classification and analysis of instructional media, and in educational programs for the gifted are described. It is concluded that this model may narrow the distance between what is known about the cognitive-affective processes and how this is utilized in educational practices. (16 ref.).—S. Knapp.

3875. Williams, Joanna P. & Ackerman, Margaret D. (U. Pennsylvania) Simultaneous and successive discrimination of similar letters. *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 132-137.—Explored the relative effectiveness of different presentations of letters in 2 experiments. Exp. I, with 40 1st grade children, compared simultaneous and successive discrimination tasks under varying degrees of stimulus similarity, i.e., b vs. d, or s vs. b. In Exp. II, using 48 1st graders, simultaneous and successive presentation of highly similar letters (b and d) were compared in a paired-associate paradigm that simulated the early reading task. Results indicate that 1st graders learn to discriminate and to respond to very similar letters that are reversals of one another more easily when the letters are presented successively. Suggestions for the development of training programs in early reading are made.—*Journal abstract*.

Teaching Methods & Teaching Aids

3876. Andriette, William R. (Syracuse U.) Differences in retention between populations of seventh grade science students taught by two methods of instruction: Small group laboratory and teacher demonstration. *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2753-2754.

3882. Feldman, David H. & Sears, Pauline S. (U. Minnesota) Effects of computer assisted instruction on children's behavior. *Educational Technology*, 1970-(March), Vol. 10(3), 11-14.—Investigated the effects of computer assisted instruction (CAI) in 45 1st grade children receiving CAI reading or mathematics. 27 1st grade children in regular classes served as the comparison group. A Behavior Survey Instrument was used to rate classroom behavior. Findings indicate that social behavior decreased in the CAI Ss and that correlations between academic behavior and achievement were reduced in CAI subject areas. It is concluded that CAI may be a "mixed blessing," but that the present study does indicate its value in rendering achievement less dependent on classroom behavior.—S. Knapp.

3883. Francis, Azalia S. (George Peabody Coll. for Teachers) The development and preliminary field testing of a multisensory language development program for kindergarten, first grade and fourth grade. *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2789.

3886. Koerber, Leonard G. (Indiana U.) Attitude-achievement interaction: A scale of attitude toward programmed instruction applied in a differentiated verbal learning task. *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2738.

3887. Lunneborg, Clifford E. (U. Washington) Generalized linear hypothesis: A unified approach to teaching. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 105-106.—The universal availability of high speed computational services in universities and colleges

permits a basic readjustment in the teaching of experimental design and other quantitative techniques. Rather than teaching a series of relatively disjoint designs, techniques or quantitative topics, it is now possible to develop the widest variety of specialized techniques from the common base of an hypothesized linear relationship between variables. By emphasizing the resultant interrelatedness of widely utilized statistical techniques this approach to teaching should provide students with a wider range of useful statistical tools and promote more effective use of those tools.—*Author abstract.*

3888. MacLaine, A. G. (U. Sydney, New South Wales, Australia) **A critical evaluation of programmed instruction.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 93-103.—Describes the linear, branching, and computer-assisted forms of programed learning techniques, and discusses the advantages and disadvantages of the various methods. General advantages are said to include the activity involved in learning a logical sequence of frames in which consistent success and immediate feedback reinforce learning. Additional advantages are provided by the emphasis on teaching rather than testing, the experimental control facilitating research, and the opportunity for each student to proceed at his own pace. Disadvantages include the difficulty of writing and validating programs, and the expense, the necessary reliance on reading ability, and the necessary isolation of students. A review of the research literature, as well as a discussion of some of the practical educational implications of programed instruction is also provided.—*R. Wiltz.*

3889. McCord, Bob C. (U. Mississippi) **A comparison of four methods of speech instruction with third and fourth grade culturally deprived boys and girls as measured by improvement in articulation, auditory memory span, and vocabulary.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 3075.

3890. Orr, William C. **Retention as a variable in comparing programed and conventional instructional methods.** *Journal of Educational Research*, 1968(Sep), Vol. 62(1), 11-13. Sailors were divided into 2 matched groups; 1 received programed instruction and the other received the conventional lecture method of instruction. Ss were retested at intervals of 1 day, and 1 and 2 wk. There were no significant differences between the 2 groups at any time. In view of some practical advantages of programed instruction, and the results of this study, it is felt that it deserves careful attention as an effective teaching method.—*Journal abstract.*

3891. Rhodes, Fen. (California State Coll. Long Beach) **Team teaching compared with traditional instruction in grades kindergarten through six.** *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 110-116.—Compared the effectiveness of an elementary school with team teaching at all grade levels to a control school with traditional, self-contained classes. Achievement in reading, spelling, and arithmetic, and pupil attitude toward school and learning were measured in 316 students from both schools at the beginning and end of the year. Attitudes of teachers and parents at the year end were also assessed. In no instance was team teaching found to be superior to traditional classroom instruction, and it was significantly worse with respect to average reading gain ($p < .01$) and change in pupil attitude ($p < .05$). Teachers of team-taught classes were more positive ($p < .05$) in their job attitude than teachers at

the control school. Parents of children attending the team vs. control school were found to be equally favorable in their opinion of school effectiveness ($p > .05$).—*Journal abstract.*

3892. Sheehan, Donald J. (State U. New York, Albany) **The effectiveness of concrete and formal instructional procedures with concrete and formal-operational students.** *Developmental Abstracts International*, 1970(Dec), Vol. 31(6-A), 2348.

3893. Soudijn, K. A., Meilenbergh, G. J., & Hartemink, B. G. (U. Amsterdam, Psychological Lab., Netherlands) **Evaluatie van een handleiding voor de interviewer.** [Evaluation of an interview instruction manual.] *Nederlandsche Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Oct), Vol. 25(9), 418-426.—49 students were used to test the instructional procedures in the learning of 3 forms of an instruction manual about interviewing. Group 1 studied 1 sem. programed text that included examples and multiple-choice questions. The questions were omitted for Group 2. In Group 3, easy expositions of the theory of interviewing were presented. All 3 groups read their respective manuals independently. An achievement test (S11) was administered to all the Ss a few hours after the reading. A parallel test (S12) was administered 3 wk. later. A practice test (P1) was administered after S12 has been completed. P1 consisted of a series of questions to be judged right or wrong about interviewing. By means of a 1-way multivariate analysis of variance, the null hypothesis of equal treatment effects was rejected at the .01 level. The results for the highest group were found for Group 1 followed by 2 and 3, respectively. (English summary)—*A. J. Ter Keurt.*

3894. Worthen, Elaine R., & Collins, James R. (U. Colorado, Lab. of Educational Research) **Reanalysis of data from Worthen's study of sequencing in task presentation.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 15-16. *Contexts and procedures re-analyses of data from 2 analyses used by B. R. Worthen (see PA, Vol. 42, 3805).* When a classroom affected by the treatment was dropped and the final of measures changed from pupil scores to class mean, there were no treatment differences on any dependent variable. Thus raising serious questions about Worthen's conclusion that "Six in Treatment D proved superior to Six in Treatment A on a majority of intertreatment comparisons."—*Journal abstract.*

PERSONNEL & INDUSTRIAL PSYCHOLOGY

3895. Herms, Emma I. **Abstracts of BESRI Research publications—FY 1969.** *US Army Human Resources Research Report*, Nov 69, Sept 70, 21, 26 p.—Presents abstracts of Technical Research Reports, Technical Research Notes, Research Studies and Research Memorandums from the Behavior and Systems Research Laboratory. Included are descriptions of 79 work units covering activities reported in the 33 abstracted publications. A list of the libraries, universities and metropolitan centers in which these publications are feature, deposited, and a listing of the Army personnel programs utilizing psychological test programs from this laboratory. *A. four career patterns and associated life history characteristics among female professional librarians. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4381.

3904. Rossmann, Jack E., Lips, Orville J., & Campbell, David P. (Macalester Coll.) *Vocational interests of political scientists*. *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 135-137.—Collected SVIBs from 177 male members of the Midwest Conference of Political Scientists. Their interests were most like those of psychiatrists and psychologists, public administrators and social workers, librarians and musicians, and lawyers and author-journalists. When compared with sociologists, political scientists had interests less like those of applied biological scientists, physical scientists, outdoors and skilled worker occupations, administrators, and businessmen. Similar differences were found between psychologists and political scientists.—*Journal abstract*.

3905. Shore, Thomas C. (U. Maryland) *A study of relationships between the General Aptitude Test Battery scores and achievement in selected industrial cooperative training programs in North Carolina*. *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2720-2721.

3906. Watley, Donivan J. & Nichols, Robert C. (National Merit Scholarship Corp., Evanston, Ill.) *Career decisions of talented youth: Trends over the past decade*. *National Merit Scholarship Corporation, Research Reports*, 1969, Vol. 5(1), 14 p.—Various trends were found in the educational major and career choice decisions of National Merit Finalists from 1957-1967. Interest among boys in the physical sciences increased immediately after Sputnik and then declined until about 1963 when it stabilized close to the prespace probe level. Interest in the social sciences has been almost the mirror image of the physical sciences: declining in 1958 and 1959 but increasing until 1965 and declining slightly since then. The choice of engineering decreased sharply after 1957 but began to stabilize about 1962. Interest in teaching among both sexes increased until about 1962. Since then, girls have shown a declining interest in teaching. Business and other practical fields have shown steady declines, the reverse of the increasing trend of interest in the humanities. If these decisions are considered representative of students in the top 1% of measured scholastic ability, many of the temporal shifts observed are large enough to have a marked effect on the availability of talented people to work on the problems associated with different career fields.—*Journal abstract*.

SELECTION & PLACEMENT

3907. Ash, Philip. (U. Illinois, Chicago) *Screening employment applicants for attitudes toward theft*. *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 161-164.—Describes the Reid Report, a 3-part instrument (scoreable attitudes-toward-theft inventory, biographical data blank, admissions list of past delinquencies) designed to predict the likelihood that an employment applicant will steal from his employer. For a sample of 254 employment applicants, Reid Report evaluations were correlated with evaluations based on polygraph interviews. For each device the evaluation alternatives were: recommended for hire, qualified recommendation, not recommended. Chi-square for the 3×3 table was 45.15 ($p < .001$). A Pearson product-moment

correlation coefficient between polygraph evaluations and Reid Report evaluations was .43 ($p < .001$). (22 ref.)—*Journal abstract*.

3908. Blakeney, Roger N. & MacNaughton, John F. (U. Houston) **Effects of temporal placement of unfavorable information on decision making during the selection interview.** *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 138-142.—126 male evening school management students rated an applicant for employment after listening to standardized audio tapes of a simulated interview in which the location and content of 1 piece of unfavorable information was systematically varied. An 18-cell analysis of variance design was used which counterbalanced the temporal placement of the unfavorable information, the content area in which it occurred, and the order of the content areas. Scores on the Dogmatism Scale (Rokeach) were analyzed with multiple-regression techniques. The temporal placement effect was significant at the .01 level. None of the other effects were significant. It was concluded that the temporal placement of the unfavorable information accounted for a statistically significant percentage of the variance in the ratings.—*Journal abstract*.

3909. Gluskos, Ury & Brennan, Thomas F. (Temple U.) **Selection and evaluation procedure for operating room personnel.** *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 165-169.—16 surgeons and supervisors of operating room (OR) personnel rated 100 behavioral statements pertaining to OR performance on a 1-7 importance scale. 42 statements were retained and incorporated into a final criterion list on the basis of mean rated importance and agreement among raters as measured by their standard deviations. 163 OR personnel were then rated by their supervisors and 40 were administered the Wonderlic, O'Connor Finger Dexterity Test, Press Test, and 3 scales of the CPI. Factor analysis of the criterion variables revealed that 54% of the variance could be accounted for by 4 factors: general technical knowledge, attention to detail, patient awareness, and social interaction. The 1st 3 factors were significantly related to 1 or more of the predictor variables.—*Journal abstract*.

3910. Leiren, Bjorn D., Kiker, Vernon L., & Phelan, Joseph G. (California State Coll., Los Angeles) **Validating the selection of deputy marshals.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 131-132.—Examined field and training criteria of success for the position of deputy marshal and determined several predictors of that success. Criteria and predictor scores on 121 deputies were factor analyzed and principal factors obtained. Multiple regression analyses were performed to obtain maximum predictive efficiency. The r 's obtained for prediction of training success are typical. For 2 subgroups ($N = 60$) multiple r 's of .606 ($p < .01$) and .572 ($p < .01$) were obtained. The beta weights and the samples were then recombined and the final regression weights obtained and a "shrunk" r computed.—*Author abstract*.

3911. Maier, Milton H. & Fuchs, Edmund F. **Development of improved aptitude area composites for enlisted classification.** *U.S. Army BESRL Technical Research Report*, 1969(Sep), No. 1159, 46 p.—Nearing completion is a large-scale validation study of operational and experimental measures conducted across a

full range of the Army's Military Occupational Specialties. The measures were evaluated for effectiveness in predicting final grades in Army school training courses and subsequent performance in Army job assignments. Test and criterion data are the source of 2 major developments in the initial classification of enlisted men: (a) 8 new and improved aptitude area composites based in the Army Classification Battery, and (b) a long-term study of the differential validity of both operational and experimental measures with a view to possible major reconstitution of the aptitude area system. The new composites and benefits to be derived from their use—specifically, enhancement of productivity of enlisted men in training assignments—are described. *A. J. Drucker*.

3912. Roach, Darrell E. (Nationwide Insurance, Columbus, O.) **Double cross-validation of a weighted application blank over time.** *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 157-160.—Reports a 2nd cross-validation of a weighted application blank for predicting tenure of clerical employees. The sample consisted of 199 female employees hired during a later time period than the initial and cross-validation samples. Application blanks were scored using the weights previously developed. A substantial loss in predictive power was found in the additional cross-validation. Changes in labor market conditions, manpower needs, and specific changes in personnel policies appear to be responsible for the loss in efficiency. Results suggest cross-validation of such blanks with samples of employees hired during a later time period and periodic checks on their continuing validity.—*Journal abstract*.

3913. Samuel, J. A. (Post Office Appointments Center, Psychological Services Branch, London, England) **The effectiveness of aptitude tests in the selection of postmen.** *Studies in Personnel Psychology*, 1970(Oct), Vol. 2(2), 65-73.—Correlated aptitude test scores used in the selection of 3205 postmen (over 18 yr. of age) and 550 15-18 yr. old young postmen, recruited from 1959-1960, to supervisors' evaluations of their present performance and potential future performance. Scores were rated on 5-point scales. The aptitude test for postmen, unique to the United Kingdom Post Office, consisted of 3 subtests: "Names and Opposites," "Checking," and "Observations." The Subtests for young postmen were: "Arithmetic I," "Arithmetic II," "Names and Opposites," and "Instructions." Results indicate a significant tendency for those in both groups with higher scores to remain in the Post Office. The positive relationship between promotion and test score was significant for postmen, but not for young postmen. Significant differences between postal regions was observed, as well as between age groups on subtests. A significant positive correlation was observed between test score and present performance for postmen, but not for young postmen. Reasons for various findings are discussed.—*J. Tiedemann*.

3914. Webb, Philip A. **Rorschach assessment of business executives.** *Australian Psychologist*, 1969-(Nov), Vol. 4(2 3), 171-174. Discusses the possibilities of using the Rorschach Ink Blot Test to identify potentially successful business executives. On the basis of previously reported investigations, it is suggested that when the test is administered with more definite instructions, followed by testing the limits, and when overt behavior rather than subconscious tendencies are used as criteria for interpretation, the potentially eminent

executive and many others with potential for solid achievement can be located. The Percept-analytic Executive Scale is also discussed as a device for the selection and placement of such individuals.—*R. Wiltz.*

TRAINING

3915. Bisseret, A. & Enard, C. **Le problème de la structuration de l'apprentissage d'un travail complexe.** [The problem of structuring the learning of a complex task.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(11-12), 632-648.—Presents a detailed plan for the training of air traffic controllers. (22 ref.)—*R. E. Smith.*

3916. McFann, Howard H. (HumRRO, Monterey, Calif.) **HumRRO research on Project 100,000.** *HumRRO Professional Paper*, 1969(Dec), No. 37-69, 11 p.—Presents findings of HumRRO research associated with Project 100,000. Objectives are to obtain information on what impact men taken into the Army under this program will have on training and operations, and to understand the relationship between measured aptitude and performance in training and on the job. Data show the general relationship between Armed Forces Qualification Test scores and performance to include laboratory tasks and operational training. 1 conclusion is that effective training must take into account individual differences. Plans are presented to provide necessary information on factors involved and techniques to account for them.—*HumRRO.*

3917. Sellman, Wayne S. (Lowry Air Force Base, Technical Training Div., Colo.) **Effectiveness of experimental training materials for low ability airmen.** *USAF AFHRL Technical Report*, 1970(Jun), No. 70-16, 19 p.—Studied whether modifying career development course (CDC) format through the simplification of the written materials, the inclusion of more illustrations, and the addition of audio supplementation could improve the CDC as a training device designed to teach basic job information, especially to airmen possessing minimum verbal skills. 180 high, middle, and low aptitude personnel studied 3 versions of the CDC for a fire protection course. The versions included a conventional CDC, a less verbal CDC with more pictorial materials, and a less verbal CDC with more pictorial materials accompanied by a tape recording of complementary information. Data were collected on learning performance, reading speeds, and attitudes toward the CDCs. Analyses revealed that the modified CDC with the audio supplementation produced significantly increased learning scores. High and middle aptitude groups consistently outperformed the low aptitude groups across all CDCs. (20 ref.)—*Journal abstract.*

3918. Tallmadge, G. Kasten & Shearer, James W. (American Inst. for Research in the Behavioral Sciences, Palo Alto, Calif.) **Interactive relationships among learner characteristics, types of learning, instructional methods, and subject matter variables.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 31-38.—Examined whether learning can be enhanced by employing instructional treatments differing in design and use as a function of learner characteristics. 6 experimental courses were developed reflecting different combinations of inductive and deductive teaching methods, rote and understanding types of learning, and 2 different subject matters. Achievement test scores following instruction were correlated with the 39 aptitude, interest, and achievement measures obtained on 353

Navy enlisted men. A statistically significant interactive relationship was found between learner anxiety and method of instruction which was consistent across the 2 subject matters and the 2 types of learning. (15 ref.)—*Journal abstract.*

3919. Winn, Alexander. (Laval U., Quebec, Canada) **Forbidden games.** *International Journal of Group Psychotherapy*, 1970(Jul), Vol. 20(3), 356-365.—Questions whether useful, practical, and transferable elements of laboratory education, from the T-group, will lead to effective organizational application. "The perplexing question facing the practitioner is what can be transferred from a stranger, 'diversified' lab to the individual's work situation? The temptation is strong to accept the sad probability that the abreactive experience in a stranger lab does not lead to a great measure of real or internalized change. The image of the laboratory as an isolated cultural island is strong. The individual does not behave on his return to the mainland the way those 'natives' on the island behaved, and perhaps he should not. Trust as a commodity cannot be carried in a suitcase across the sea." Implications for effecting a social change in an industrial organization are examined.—*I. Linnick.*

3920. Birnbaum, A. H., Sadacca, Robert; Andrews, R. S., & Narva, M. A. **Summary of BESRL surveillance research.** *U.S. Army BESRL Technical Research Report*, 1969(Sep), No. 1160, 56 p.—Summarizes in integrated fashion the major problem areas, the rationale of the Behavior and Systems Research Laboratory's approach to their solution, and the general course of completed or ongoing research studies in the surveillance areas of manned systems experimentation. Studies of the Surveillance Systems research programs are conducted within 4 work units—interpreter techniques, image interpretation displays, intelligence systems, and image systems. Research effort in these areas has resulted in findings which are applicable in optimizing human component performance in existing systems and in providing systems developers with information useful in design specifications for future systems.—*A. J. Drucker.*

TASK & WORK ANALYSIS

3921. Cockrell, John T. (System Development Corp., Falls Church, Va.) **Maintaining target detection proficiency through team consensus feedback.** *U.S. Army BESRL Technical Research Note*, 1969(Dec), No. 219, 24 p.—Attempted to determine if the target detection skill of individual interpreters can be improved by feedback which team members generate for themselves as they compare and discuss their work. This study differed from a previous experiment (see J. T. Cockrell, PA, Vol. 43:1579) in that target detection only was required rather than detection plus identification. Each S (N=60 enlisted men) was tested before and after a 3-day practice session to assess detection proficiency under predetermined experimental conditions. From both experiments conducted evidence points to the effectiveness of team consensus feedback in maintaining and enhancing performance of interpreters in field units, particularly in target identification and reduction of inventive errors. The technique appears to be especially useful where ground truth is not available.—*A. J. Drucker.*

3922. Csirszka, János. **A munkaalkalmasság érzelmi feltételei (Diagnózis-séma).** [The emotional

preconditions of the fitness for work (Diagnosis scheme).] *Pszichológiai Tanulmányok*, 1967, No. 10, 435-439.

3923. Epstein, Sidney. (System Development Corp., Falls Church, Va.) **Effects of image incongruence on location of common terrain in comparative cover.** *U.S. Army BESRL Technical Research Note*, 1970(Feb), No. 222, 31 p.—Attempted to determine the effects of variation in amount of image overlap and of discrepancies in scale and orientation on an interpreter's ability to select comparative cover frames for change detection. 96 trained image interpreters were required to locate, on rolls of new photographic cover, frames depicting terrain in common with earlier photo frames. Variation in frame presentation was controlled on percent of overlap and discrepancy in scale and orientation between the 2 covers. Ss and rolls of film were assigned to 12 experimental conditions in a Greco-Latin square design. It was generally concluded that interpreter performance is seriously degraded when comparative cover varies in scale and orientation and is not completely overlapping. Findings suggest that in operational practice, degrading effects of image incongruence upon interpreter performance in identifying comparative cover can be minimized by availability magnification and image rotation capabilities in the display system.—A. J. Drucker.

3924. Farrell, John P., Banks, James H., & Sternberg, Jack J. **Search effectiveness with the starlight scope and 7 × 50 binoculars.** *U.S. Army BESRL Technical Research Report*, 1970(Jun), No. 1164, 33 p.—Attempted to: (a) identify critical factors affecting performance, (b) develop instrumentation and technologies for subsequent research in the night operations area, and (c) assess for operational purposes performance effectiveness with the starlight scope (AN/PVS-2) and the standard Army 7 × 50 binoculars (M17). A total of 65 operators were tested, 4 men each night, 3 using the starlight scope and 1 using the binoculars. Ss were required to detect targets presented in 2 modes. Responses were recorded electronically for data analysis. Results showed the starlight scope to be superior under all conditions studied and to enhance target detection ability. The study provided base-line performance data on the starlight scope and 7 × 50 binoculars and resulted in development of practical and effective methodology and instrumentation applicable to a wide range of field experimentation and testing with night vision devices and sensors.—A. J. Drucker.

3925. Hódos, Tibor. (National Inst. of Labor Hygiene, Budapest, Hungary) **Fonóók munkatevékenységének és munkakörülményeinek-pszichológiai vizsgálata.** [Psychological study of the work process and working conditions of spinner women.] *Pszichológiai Tanulmányok*, 1967, No. 10, 461-465.

3926. Jeffrey, Thomas E. **Unaided reading of coded reconnaissance data.** *U.S. Army BESRL Technical Research Note*, 1969(Dec), No. 220, 37 p.—Attempted to determine the feasibility of having interpreters decode sensor and terrain information encoded on imagery by direct viewing instead of resorting to use of elaborate code reading machines. Achievement was measured in terms of time required for interpreters to locate the required block, decode and record the data, and number of correct decodings. Major findings indicate: (a) the average interpreter was 98% accurate in translation from code to clear language, (b) direct inspection was not

significantly aided by magnification, (c) 7-power magnification reduced decoding time over 2-power magnification, and (d) practice significantly reduced coding time. Accuracy was not affected. Procedures, suggested by the study, for interpreter practice and improvement in recognizing spatial patterns are presented.—A. J. Drucker.

3927. Klingberg, C. L., Elworth, C. L., & Epstein, S. (Boeing Co., Seattle, Wash.) **Change detection in aerial photo coverage as influenced by methods of comparison.** *U.S. Army BESRL Technical Research Note*, 1969(Jan), No. 205, 37 p.—Reports on a study of methods of comparing current with prior imagery cover of a given area as means of detecting change in the status of targets in the area. 4 methods of comparing early and late imagery, 2 levels of interpreter experience, and 2 time limits were combined into the 16 experimental conditions under which the testing was conducted. 16 groups of student interpreters performed a tactical target change detection task, each group viewing comparative scenes either 5 or 15 min. Results point to an advantage in using a computerized comparison procedure in an advanced surveillance system. For maximum operational efficiency, interpreters of the prior imagery should be assigned to make subsequent comparative cover analysis of the area.—A. J. Drucker.

3928. Levine, Jerrold M., Fealock, J. Bennett; Sadacca, Robert, & Andrews, Robert. (North American Rockwell Corp., Columbus, O.) **Method for quantifying subjective costs of large numbers of image interpretation errors.** *U.S. Army BESRL Technical Research Note*, 1969(Nov), No. 218, 68 p.—Attempted to develop a method of quantifying the subjective costs that a field commander associates with the consequences of action taken on the basis of erroneous image interpretation reports. Nearly 3500 interpretation errors were defined by means of a hierarchical target classification and reporting scheme. Magnitude estimation was chosen as the only feasible technique for establishing an interval scale of costs for so large a number of errors. Cost estimates obtained by applying 2 scaling procedures and the magnitude estimation technique were compared statistically to evaluate scale validity, reliability and sensitivity. Utility of error costs matrices in military situations is discussed.—A. J. Drucker.

3929. McCormick, Ernest J. & Mecham, Robert C. (Shri Ram Centre for Industrial Relations, New Delhi, India) **Job analysis data as the basis for synthetic test validity.** *Psychology Annual*, 1970(Mar), Vol. 4, 30-35—Reports a preliminary investigation into whether "valid personnel test standards for jobs could be derived synthetically, using worker-oriented job elements as the 'units' of possible common denominators of jobs." The Position Analysis Questionnaire, consisting of worker-oriented job element questions, was compared to job dimension scores derived from principal components analysis of job and attribute profile data on 179 jobs. Findings were then compared with data available from the United States Employment Service on the mean test scores and coefficient of validity on the General Test Battery for the jobs. Results support the hypothesis. Limitations of the study are discussed.—S. Knapp.

3930. Molnár, Imre & Stadler, Egon. (National Medical Inst. for Physical Education & Sport, Budapest, Hungary) **A szervezet alkalmazkodása különböző nehézségű szövegépek azonos munkamozzanataihoz.** [Adjustment of the organism to identical work-

phases in looms of different difficulty.] *Pszichológiai Tanulmányok*, 1967, No. 10, 441-451.

3931. Sági, Antal & Vaszkó, Mihály. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **Munkatevékenységek struktúráinak vizsgálata különös tekintettel a fáradtsági és termelékenységi tényezőkre.** [Examination of the patterns of the work processes with reference to the fatigue and productivity factors.] *Pszichológiai Tanulmányok*, 1967, No. 10, 425-434.

3932. Sternberg, Jack J. & Banks, James H. **Search effectiveness with passive night vision devices.** *U.S. Army BESRL Technical Research Report*, 1970(Jun), No. 1163, 99 p.—Describes the research methodology and findings from the 1st of a series of research phases of the Behavior and Systems Research Laboratory Night Operations Program. Performance effectiveness of 4 passive night vision devices was evaluated simultaneously in the experimental procedure: miniscope, starlight scope, crew served weapon night vision sight, and night observation device, medium range. 123 enlisted men were tested at a rate of 9/night under 3 varied ambient illumination levels in the search and detection of 72 targets. Detection responses and search behavior were recorded on magnetic tape for data analysis. Findings presented in this initial report do not represent a complete analysis of results because of continuing availability of performance information. Follow-up reports, more detailed in analysis, as well as reports of additional experimentation, are in preparation.—A. J. Drucker.

PERFORMANCE & JOB SATISFACTION

3933. Boyles, Wiley R., Prunkl, Peter R., & Wahlberg, James L. (HumRRO, Ft. Rucker, Ala.) **Combat aviator criterion development.** *HumRRO Professional Paper*, 1969(Nov), No. 34-69, 10 p.—Discusses factors in the development of criteria for proficient performance of a complex job in the context of the Army aviation combat situation. Ratings of 201 aviators by peers, subordinates, and superiors on pertinent job behaviors were collected following identification of the pertinent behaviors by the critical incident method. Moderator variable effects on the ratings are described and some alternative strategies noted.—*HumRRO*.

3934. Comisarow, Ruth W. (Case Western Reserve U.) **Work motivation of female health field workers.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4378.

3935. Fine, B. D. (Tel Aviv U., Israel) **Comparison of work groups with stable and unstable membership.** *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 170-174.—Compared 151 employees in work groups with unstable membership to 582 employees in similar groups with stable membership. Contrary predictions concerning the effects of unstable membership were derived from the R. Likert and the W. G. Bennis conceptions of organization structure. Employees in unstable work groups reported less within-group peer leadership, but more favorable organizational context. Contrary to the prediction derived from Likert's theory, there were no differences on measures of group-referent intervening variables and end-result variables, suggesting the viability of organic-adaptive structure described by Bennis. Increased lateral linkage among work groups of unstable membership is suggested as the mechanism that

appears to compensate for the decreased peer leadership evident in unstable work groups.—*Journal abstract*.

3936. Giles, Brian A. & Barrett, Gerald V. (U. Rochester, Management Research Center) **Utility of merit increases.** *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 103-109.—Utilized a magnitude estimation technique to determine the relationship between merit increases and satisfaction for 157 professional employees of an electronics organization. The linear, logarithmic, and power functions were fitted to the data in combination with 4 frames of reference. The power function and the percentage of perceived equitable merit increase frame of reference gave the best fit to the data. The Bernoullian concept of diminishing utility for each added dollar was not supported. Analyses found that each dollar of merit increase had increased utility. For approximately 10% of the sample, satisfaction was not a monotonic increasing function of dollars. This is contrary to accepted economic theory but is consistent with equity theory. (18 ref.)—*Journal abstract*.

3937. Huber, Norman A. (Wayne State U.) **Superior-subordinate similarity, performance evaluation, and job satisfaction.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4380.

3938. Joseph, Jacob S. (Central Labour Inst., Bombay, India) **Differential perception of factors in job attitudes.** *Psychology Annual*, 1970(Mar), Vol. 4, 22-29.—Examined job attitudes in 19 semiskilled production workers. Each S ranked 16 job and situational factor statements in order of importance and chose 1 of 5 indicators of job satisfaction/dissatisfaction. 15 Ss were asked to rank the 16 statements again after 2 wk. The S's job suitability was then rated by his supervisor. High internal agreement was found among the satisfied Ss, while little was found among the dissatisfied Ss; these findings were increased when the groups were split into satisfied-suitable and dissatisfied-unsuitable. Results indicate "that there is differential perception of job factors by satisfied and dissatisfied workers which have certain practical implications."—S. Knapp.

3939. Karp, Harvey B. (Case Western Reserve U.) **An investigation of the motivational patterns in industrial salesmen.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4380-4381.

3940. Khot'syanov, L. K. **Voprosy analiza i sinteza v gligienicheskikh issledovaniyakh sovremennosti.** [Problems of analysis and synthesis in contemporary hygienic research.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970(Dec), Vol. 25(12), 3-12.—Contains research materials on the effect of "hermetic [closed] structures" on factory production. The continuous use of artificial light, in particular, introduces negative consequences.

3941. Latham, G. P. & Ronan, W. W. (American Pulpwood Assn., Harvesting Research Project, Atlanta, Ga.) **The effects of goal setting and supervision on the motivation of pulpwood workers.** Atlanta, Ga.: American Pulpwood Assn., Harvesting Research Project, 1970. 5 p.—Investigated the effects of goal setting and supervision on 4 performance criteria. A factor analysis of a questionnaire administered to 292 pulpwood producers indicated that supervision is correlated with high productivity and low injury rate only when it is accompanied by goal setting. Goal setting alone, however, resulted in employee turnover. Supervision alone did not correlate with any performance criterion. No relationship was found between goal setting or supervision and absenteeism.—*Author abstract*.

3942. Lawrie, J. W. (Wabash Coll.) **Making it—the hardest way.** *Psychology Today*, 1969(Nov), Vol. 3(6), 29-31, 60.—There are 2 basic reasons why hard-core unemployed Negroes often fail when given work: cultural deprivation and an unconscious fear of lost manhood. Conversations with business managers as well as with the Negro applicants indicated that many Negroes may be psychologically defeated before they begin and that direct supervisors of such Negroes may not try hard to make the programs work. The suggestion is made that acculturation training must accompany job training and a 1:1 program of personal support is necessary if the hard-core unemployed are going to be successful.—E. J. Posavac.

3943. Muthaaya, B. C. (National Inst. of Community Development, Hyderabad, India) **A study of job tensions among block development officers.** *Psychological Annual*, 1970(Mar), Vol. 4, 13-17.—Examined job tensions in 12 block development officers (administrators of community development programs in areas comprising approximately 10,000 people). An 18-item Job Related Tension Index Scale was administered to Ss. Tension levels were slight overall. Those job aspects in which it was high were (a) lack of authority, autonomy, and information necessary to do the job; (b) overwork; (c) incompatible demands by referent groups; (d) having to act against one's convictions; and (e) lack of a feeling of achievement. It is concluded that certain job aspects may become the harbingers of dissatisfaction, lead to tension and ultimately unrest within the entire organization.—S. Knapp.

3944. Oster, Ariel. (Wayne State U.) **Attitudes as mediators of the effects of participation in an industrial setting.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4382.

3945. Symonds, Martin. (New York U., Medical School) **Emotional hazards of police work.** *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 155-160.—Discusses personal experiences with a large city police department. Sources of stress for policemen are described. Problems in the screening process of policemen are noted, and suggestions are made concerning personality types who pass screening procedures, but who, under the stress of police work, become ineffective.—H. Roemmich.

MANAGEMENT & ORGANIZATION

3946. Barrett, Jon H. (U. Michigan) **Integrating individual goals and organizational objectives.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4377.

3947. Davies, Evan & Binks, Noel. (U. New South Wales, Kensington, Australia) **Some motivational characteristics of senior managers.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 167-170.—A criterion of managerial success of 25 general managers or managing directors of substantial companies within New South Wales was determined by rank ordering Ss on each of 5 sources of company information and summing each of 5 sources for each individual. Ss were then administered the Motivational Analysis Test, providing 10 factor analytically derived motives, 10 concomitant conflict scores, and 5 ancillary measures. Rank order correlations indicate positive relationships between the criterion and super-ego strength, mating motivation, autism-optimism, and parental-home conflicts; negative relationships were found between the criterion and

narcissism, pugnacity, and affectionate-spouse attachment. Results suggest the dismissal as "shibboleths several popular notions concerning the motivations of managers."—R. Wiltz.

3948. Dunnette, Marvin D. (U. Minnesota) **Managerial effectiveness: its definition and measurement.** *Studies in Personnel Psychology*, 1970(Oct), Vol. 2(2), 6-20.—Surveyed the management identification and development practices of 33 companies as a basis for deciding how and where to direct future research grants. Among the elements of effective managing described, is the individual's ability to allocate all resources—human, financial, and material. The problem of measuring what the manager himself does toward effective or ineffective resource allocation is identified and discussed in terms of the current approaches in measuring managerial effectiveness. The advantages for behavior-based rating scales are discussed.—J. Tiedemann.

3949. Gantz, Benjamin S., Erickson, Clara, & Stephenson, Robert W. (California State Polytechnic Foundation, Center for Creative Leadership, Claremont) **Measuring the motivation to manage in a research and development population.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 129-130.—Reports the use of and cites evidence for the construct validity of a relatively new projective instrument purporting to measure the motivation to manage. The instrument is titled the Miner Incomplete Sentences Scale and was constructed as an operational measure to test Miner's role-motivation theory of managerial effectiveness. Ss were 117 successful, employed scientists. Evidence of the construct validity of the device is adduced from an extensive battery of psychometric instruments administered to the same population. Additional evidence is cited from factor analysis of 50 selected test variables from the psychometric battery, and from comparison of the Miner with a criterion measure of managerial potential.—Author abstract.

3952. Srinivasan, V., Shocker, Allan D., & Weinstein, Alan G. (Carnegie-Mellon U.) **Development of a composite criterion of managerial success.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 127-128.—One of the problems in developing a composite criterion is the weighting of its multiple components. Pairwise dominance judgments of 20 profiles of managers on 6 criterion elements served as input data in determining a composite measure of managerial success. United States and foreign executives in 2 management development programs served as judges. The weights were derived using mathematical programming. A good fit to the pairwise judgments was obtained. Compensation and expenditure authorization were the most important criterion elements. Other important elements receiving lesser weights were level of supervision and career satisfaction.—Author abstract.

SPECIAL ENVIRONMENTS

3953. Gzenko, O. G. & Alyakrinskiĭ, B. S. *Vliyaniye dlitel'nogo kosmicheskogo polëta na chelovecheskii organizm*. [Influence of prolonged space flight on the human organism.] *Vestnik Akademii Nauk SSSR*, 1970 (Nov), Vol. 40(11), 40-46.—Presents data on the physical and psychological aspects of the 18-day-long flight in the spaceship "Soyuz-9" by 2 astronauts. Materials procured during the flight and in the postflight period showed that man can operate for that length of time with preservation of sufficient psychological and physical efficiency. The most serious attention should be directed to maintenance of the diurnal rhythms of the functions of the organism. The difficulties encountered in adapting to unusual diurnal rhythms should be considered in developing a system for choosing astronauts. Strict observance of rational regimes of work and rest, developed on the basis of the data of "biorhythmology," serves as reliable prophylaxis of desynchronization on board the spaceship.—*I. D. London*.

3954. Sachs, Murray B., O'Brien, Gary J., Sergeant, Russell L., & Russotti, Joseph S. *Speech intelligibility in a stationary multipath channel*. *U.S. Naval Underwater Sound Laboratory/U.S. Naval Submarine Medical Center Joint Report*, 1969(Mar), No. 574, 6 p.—The reception of speech transmitted through an acoustic channel such as the ocean is limited by multipath "time-smearing." The purpose of this study was to obtain a quantitative measure of the effects of such time-smearing on speech intelligibility. A linear, time-invariant channel was used as a model of the ocean. The impulse response of this channel was a sample of band-limited Gaussian noise. Using fast Fourier transform techniques, words of the Modified Rhyme Test were convolved with, or smeared in the time domain, by this channel impulse response. The intelligibility of these "smeared" words was measured as a function of the impulse response duration. T. Intelligibility decreased monotonically to about 75% as T increased to 200 msec. Further increase in T did not significantly lower intelligibility. Distortions in time evaluated herein did not impose serious limitations to the reception of short words. However, a detailed analysis of consonantal errors revealed that sounds occurring in the middle of a word are much harder to hear correctly than are sounds at the beginning or ending of an utterance. It is concluded that time-smearing will more seriously interfere with the intelligibility of connected or conversational speech.—*Journal abstract*.

[Effect of illumination on visually determined activities of inspection and control in steel mills.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(4), 635-669. Investigated visual acuity, luminance difference thresholds, depth perception, and continuous inspection under different lighting conditions. 64 apprentices in a steel mill served as Ss. It is concluded for working places for inspecting sheet metals and polishing rolls, the low pressure sodium lamp with minimum luminances of the task of 200-300 asbestos yields the best results. The reflected image of the light source should just cover glossy tasks. (English & French summaries) (26 ref.) —*W. J. Koppitz*.

DRIVING & SAFETY

3959. Menon, A. Sreekumar. (Shri Ram Center for Industrial Relations, New Delhi, India) *Role of visual skill in safe operational behaviour*. *Psychology Annual*, 1970(Mar), Vol. 4, 18-21. Studied 220 employees of a fertilizer plant for a 10-yr period. 2 groups, an accident-repeating group and an accident-free group, were noted and matched on age, experience, pay, and educational levels. Results of a visual acuity test indicate that both monocular and binocular vision were significantly superior in the accident free group. Implications for factory safety programs are discussed. - Autogenic Seizure** (SEE Audition, Nervous System/Disorder of)
- Audition** (see also next headings, Deafness & Hearing Disorder, Ear, Intersensory Processes, Masking, Speech Perception) 2023, 2100, 2116, 2162, 2163, 2164, 2166, 2171, 2174, 2183, 2213, 2224, 2226, 2228, 2229, 2276, 2280, 2293, 2299, 2303, 2315, 2356, 2367, 2375, 2377, 2399, 2413, 2507, 2618, 2645, 2656, 2679, 3006, 3462, 3549, 3551, 3565, 3577, 3601, 3607, 3612, 3757, 3849, 3889
- Auditory Cortex & Projection Area** (SEE Cerebral Cortex)
- Auditory Deficit** (SEE Deafness & Hearing Disorder)
- Auditory Discrimination** (see also Audition) 2162, 2163, 2172, 2691, 2719, 3549
- Auditory Measurement** (see also Deafness & Hearing Disorder) 2165, 2173, 2174, 2375, 3455
- Auditory Perception** 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2714, 2722, 3049
- Auditory Thresholds** (SEE Auditory Perception, Auditory Measurement)
- Authoritarianism** (see also Conformity) 2121, 2626, 3034, 3037, 3040, 3069, 3072, 3147, 3649, 3758, 3802, 3853, 3866
- Authority** (SEE Dominance, Interpersonal Influence, Law, Management, Social Influence)
- Autism** (SEE Fantasy, Schizophrenia/Childhood)
- Autokinetic Effect** (SEE Illusion, Gestalt Psychology, Visual Perception)
- Automation & Automata** (SEE Computer, Industrial Psychology)
- Automobile** (SEE Driving)
- Autonomic Nervous System** (SEE Nervous System/Autonomic)
- Autonomy** (SEE Dependency)
- Aversion & Aversiveness** 2364, 2549, 2557, 3234, 3808
- Aversion Therapy** (SEE Behavior Therapy)
- Aviation** 2861, 3915, 3926, 3933, 3953
- Avoidance Behavior** (see also Rat/Avoidance & Avoidance Learning in) 2615, 2644, 3102
- Avoidance Learning** (SEE Learning/Avoidance)
- Awareness** (see also Arousal, Attention, Conscious States) 2249, 2444, 2608, 2879, 3373, 3458
- Balance** (SEE Somesthesia)
- Barbiturate** (SEE Drugs)
- Basal Metabolic Rate** (SEE Metabolism)
- Battered Child Syndrome** (SEE Child Abuse)
- Behavior** (see also next headings, Child/Social Behavior in, Social Behavior/Animal, Social Behavior/Human) 2087, 2088, 2425, 2791, 2809, 2977
- Behavior-Animals** 2508
- Behavior Disorder** 3112, 3327, 3328, 3330, 3489, 3492
- Behavior Problems** (see also Childhood/Behavior Problems in) 3602, 3739
- Behavior Therapy** 3136, 3140, 3161, 3175, 3213, 3215, 3216, 3217, 3218, 3219, 3220, 3221, 3222, 3223, 3224, 3225, 3226, 3227, 3228, 3229, 3230, 3231, 3232, 3233, 3234, 3235, 3236, 3237, 3238, 3239, 3240, 3283, 3294, 3537, 3561, 3591, 3614, 3625, 3626, 3677, 3739, 3763
- Behavioral Science** 2797, 3244, 3355
- Behaviorism** (SEE Behavior, Psychology/History of)
- Belief** (SEE Attitude, Value & Values)
- Bender Gestalt Test** (SEE Test/Intelligence)
- Benzedrine** (SEE Amphetamine)
- Bias** (see also Prejudice, Experimentation & Experiments) 2029, 2084, 2092, 2253, 2868, 2879, 3089
- Bibliographies** 2283, 2905, 3207
- Bilingualism** (SEE Language, Language/Foreign)
- Binet Test** (SEE Test/Intelligence)
- Biochemistry** (see also Hormone, Metabolism) 2348, 2353, 2364, 2410, 2437, 2439, 2449, 2462, 2463, 3127, 3378, 3392, 3393
- Biographies** (SEE Obituaries, History, Psychology/History of)
- Biological Rhythms** 2348, 2350, 2351, 2444, 2497, 2497, 2567, 3116, 3953
- Biology** 2349, 2510, 2799, 3023
- Bird** (see also Chicken, Pigeon) 2518
- Birth** (see also Pregnancy, Mother) 2618, 2707, 3406
- Birth Control** 2772, 2854, 2855, 2856
- Birth Order** (see also Family Relations) 2599, 2761, 2763, 2774, 2922, 3021, 3033, 3034, 3036, 3058, 3609, 3766
- Black Power** (SEE Social Movements, Integration, Negro)
- Black Pictures** (SEE Projective Technique)
- Blindness** (see also Vision/Defective) 2497, 3541, 3543, 3544, 3743
- Blood** (see also Cardiovascular Processes, Heart) 2449, 3392, 3393
- Blood-Animal** 2436, 2446, 2462, 2466
- Blood Pressure** 2201, 2389, 3555
- Body** (see also Hand, Physique) 2095, 2178, 2323, 2344, 3205, 3437, 3652, 3733, 3755
- Body Image** (SEE Self-Perception, Social Perception, Body)
- Bone Conduction** (SEE Audition)
- Books** 2022, 2418, 3381, 3701, 3898, 3941
- Boredom** (SEE Attitude, Emotion)
- Brain** (see also next headings, Cerebral Cortex, Hypothalamus, Hippocampus, Nervous System/Central, Neuroanatomy, Thalamus) 2282, 2345, 2353, 2359, 2360, 2361, 2428, 2498
- Brain-Animal** 2357, 2358, 2362, 2393, 2408, 2414, 2426, 2462, 2466, 2468, 2470, 2509
- Brain Damage** 2272, 3103, 3117, 3294, 3308, 3322, 3338, 3453, 3554, 3570, 3575, 3576, 3577, 3578, 3579, 3580, 3581, 3582, 3583, 3584
- Brain Disorder** 3346, 3481, 3483, 3568, 3571, 3578, 3630
- Brain Injury** (SEE Brain Damage)
- Brain Lesion** (see also Brain Lesion-Animal) 3574
- Brain Lesion-Animal** (see also Rat/Lesions in, Cat/Lesions in) 2358, 2366, 2373, 2374, 2375, 2376, 2377, 2379
- Brain Stimulation** (see also Rat/Brain Stimulation in) 2386, 2387, 2389, 2392, 2393, 2394, 2397.

BRIEF SUBJECT INDEX

- 2398, 2399, 2400, 2401, 2403, 2414, 2419, 2467, 2482
- Breeding** (SEE Genetics)
- Brightness** (see also Light)
2031, 2117, 2137, 2160, 2161, 2432, 3958
- Britain** (SEE Great Britain)
- Broken Home** (SEE Family, Marital Problems)
- Business**
2885, 3023, 3045, 3783, 3914, 3947, 3951, 3955
- California Psychological Inventory** (SEE Test/Personality)
- Canada**
2832
- Cancer** (SEE Disease)
- Capital Punishment** (SEE Law, Crime & Criminals)
- Cardiovascular Disorders**
3495, 3651
- Cardiovascular Processes** (see also Blood, Blood-Animal, Blood Pressure, Heart, Heart Rate)
2490
- Career** (SEE Occupation)
- Career Choice** (SEE Occupational Choice)
- Case Report**
3116, 3342, 3414, 3454, 3477, 3478, 3479, 3480, 3481, 3482, 3483, 3484, 3485, 3503, 3593
- Case Report-Treatment**
3228, 3242, 3340, 3471, 3591, 3614
- Casework** (SEE Social Casework)
- Castration** (SEE Personality, Sex, Sexual Behavior)
- Cat**
2386, 2387, 2393, 2397, 2403, 2408, 2409, 2411, 2412, 2432, 2507
- Cat/Drug Effects in**
2386, 2457, 2465, 2467, 2475, 2482
- Cat/Learning in**
2372, 2551
- Cat/Lesions in**
2365, 2367, 2369, 2372, 2376, 2387
- Catalepsy** (SEE Mental Disorder, Neurosis, Psychosis)
- Categorical Behavior**
2047, 2163, 2257, 2266, 2279, 2281, 2313, 2316, 2317, 2331, 2675, 3053, 3445
- Catharsis** (SEE Therapeutic Process)
- Cathexis** (SEE Affect, Psychoanalytic Theory)
- Catholicism** (SEE Religion)
- Census Studies** (SEE Population Characteristics)
- Central Nervous System** (SEE Nervous System/Central)
- Cerebral Cortex** (see also Visual Cortex)
2353, 2358, 2361, 2369, 2375, 2377, 2383, 2389, 2400, 2401, 2408, 2419, 2465, 2468, 2470, 2482
- Cerebral Dominance** (SEE Cerebral Cortex, Laterality)
- Cerebral Palsy** (SEE Physical Handicap, Nervous System/Disorder of)
- Cerebral Thrombosis** (SEE Brain Disorder, Cardiovascular Disorders)
- Cerebrovascular Disorder** (SEE Brain Disorder, Cardiovascular Disorders)
- Certainty** (see also Probability)
2116, 2671, 2916, 3038
- Character** (SEE Personality, Ethics)
- Character Disorder** (see also Emotional Disturbance)
3016, 3492
- Cheating** (SEE Deception)
- Check List** (SEE Inventory)
- Chicken**
2389, 2516, 2598
- Child Abuse**
- Child Guidance** (SEE Psychotherapy/Children, Guidance/Educational)
- Child Psychiatry** (see also Psychotherapy/Children, Schizophrenia/Childhood, Childhood/Psychosis in)
3167, 3271
- Child Rearing** (see also Parent-Child Relations)
2635, 2762, 2766, 2839, 3621, 3819
- Childhood & Children** (see also next headings, Gifted, Student Elementary School, Language Development, Mental Retardation)
2630, 2635, 2637, 2639, 2642, 2644, 2645, 2647, 2648, 2649, 2681, 2694, 2988, 3116, 3515, 3529, 3619
- Childhood/Ability in**
2605, 2632, 2637, 2641, 2650, 2678, 2680, 2686, 2687, 2691, 2692, 2698, 2701, 2704, 2705, 2707, 2709, 2710, 2711, 2712, 3581, 3592, 3837
- Childhood/Behavior Problems in**
3142, 3235, 3329, 3330, 3410, 3520, 3624, 3717, 3737, 3759, 3763, 3785, 3799
- Childhood/Concepts & Problem Solving in**
2603, 2606, 2607, 2632, 2666, 2667, 2670, 2678, 2679, 2680, 2681, 2683, 2684, 2685, 2686, 2687, 2689, 2690, 2692, 2699, 2700, 2701, 2702, 2710, 2711, 2716, 3581, 3637, 3754, 3892
- Childhood/Development in** (see also Age Differences-Children)
2600, 2603, 2606, 2607, 2609, 2616, 2617, 2618, 2626, 2629, 2635, 2638, 2639, 2645, 2655, 2665, 2678, 2679, 2686, 2687, 2692, 2693, 2701, 2705, 2707, 2708, 2719, 2724, 2727, 2754, 2756, 2757, 3575, 3608, 3621, 3870
- Childhood/Disadvantaged** (see also Socioeconomic Status)
2634, 2640, 2664, 2682, 2688, 2750, 2760, 3409, 3530, 3534, 3704, 3728, 3736, 3753, 3825, 3844, 3855, 3861, 3868, 3870, 3872, 3884, 3889
- Childhood/Emotional Disturbances in**
2703, 3325, 3329, 3383, 3402, 3409, 3410, 3525, 3556, 3717
- Childhood/Family Relations in** (SEE Parent-Child Relations, Family Relations)
- Childhood/Gifted** (SEE Gifted)
- Childhood/Handicapped**
2751, 3540, 3545, 3546, 3548, 3579, 3581, 3743, 3744, 3745
- Childhood/Hyperactivity in** (SEE Childhood/Behavior Problems in)
- Childhood/Learning in** (see also Achievement/Academic-Elementary School, Student/Elementary School, School Learning)
2602, 2607, 2616, 2632, 2640, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2677, 2683, 2685, 2688, 2699, 2707, 2718, 3637, 3747, 3752, 3892
- Childhood/Mental Retardation in** (SEE Mental Retardation)
- Childhood/Perception in**
2607, 2622, 2641, 2661, 2667, 2672, 2679, 2680, 2712, 2713, 2714, 2715, 2716, 2717, 2718, 2719, 2720, 2721, 2722, 2723, 2724, 2725, 2726, 2745, 3837, 3865
- Childhood/Personality in**
2600, 2617, 2632, 2636, 2646, 2673, 2684, 2716, 2727, 2728, 2729, 2730, 2731, 2732, 2733, 2734, 2735, 2736, 2737, 2738, 2739, 2740, 2741, 2742, 2743, 2744, 2745, 2746, 2762, 2763, 2830, 3609, 3711, 3716, 3765, 3824, 3831, 3859, 3870, 3878, 3879
- Childhood/Physical Illness in**
3131, 3219, 3584, 3649, 3651, 3655
- Childhood/Play in** (SEE Childhood/Social Behavior in)

- Competition** (see also Conflict, Cooperation, Motivation)
2747, 2754, 2807, 2888, 2889, 2890, 2896, 2911, 2955, 2969, 2972, 3768, 3821, 3826
- Complexity** (see also Cognitive Style, Stimulus)
2314, 2318, 2319, 2328, 2688, 2721, 2921, 3007, 3009, 3033, 3582, 3740
- Comprehension** (see also Thinking, Reading)
2242, 2694, 2986, 3565, 3839, 3918
- Compulsion** (SEE Obsession-Compulsion)
- Computer**
2032, 2051, 2052, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2084, 2268, 2697, 3119, 3324, 3669, 3882, 3887, 3888
- Concentration Camp** (SEE Prison, War)
- Concept** (see also Childhood/Concepts & Problem Solving in, Concept Formation, Thinking)
2151, 2265, 2281, 2328, 2329, 2330, 2331, 2870, 3111, 3120, 3582, 3632
- Concept Formation** (see also Childhood/Concepts & Problem Solving in)
2240, 2332, 2333, 2334, 2765, 2817
- Conditioned Emotional Response**
2200
- Conditioned Galvanic Skin Response** (SEE Galvanic Skin Response)
- Conditioned Reflex** (SEE Conditioned Response, Reflex)
- Conditioned Response**
2408, 2541, 2542, 2546, 2551
- Conditioning** (see also next headings)
2093, 2245, 2247, 2248, 2249, 2251, 2271, 2420, 2422, 2544, 2551, 2557, 2580, 2613, 2660, 3254, 3636
- Conditioning/Avoidance** (SEE Learning/Avoidance, Rat/Avoidance & Avoidance Learning in)
- Conditioning/Classical**
2093, 2100, 2193, 2251, 2397, 2550, 3677
- Conditioning/Escape** (SEE Escape)
- Conditioning/Eyelid**
2245
- Conditioning/Interceptive**
2344, 2420, 3460
- Conditioning/Operant** (see also Rat/Conditioning in)
2246, 2250, 2398, 2542, 2546, 2570, 2572, 2586, 3221, 3226, 3460, 3492, 3624, 3690, 3763
- Conditioning/Verbal** (SEE Learning/Verbal)
- Conference** (SEE Symposium)
- Confidence Judgment** (SEE Certainty)
- Conflict** (see also Frustration, Learning/Avoidance, Interpersonal Processes)
2088, 2644, 2804, 2818, 2901, 2904, 2939, 3040, 3042, 3077, 3102, 3415, 3525, 3715, 3943
- Conformity** (see also Authoritarianism, Dominance, Expectation, Interpersonal Influence, Social Influence)
2896, 2943, 3015, 3060, 3072, 3288, 3615, 3707, 3855
- Congress** (SEE Symposium)
- Connotation** (SEE Meaning, Semantics)
- Conscience** (SEE Value & Values, Ethics, Motivation)
- Conscious States** (see also Awareness)
1986, 1989, 2186, 2187, 2344, 2429, 3044, 3075, 3385
- Conservation** (SEE Childhood/Concepts & Problem Solving in)
- Conservatism** (SEE Political Behavior, Personality Trait)
- Consonance** (SEE Dissonance)
- Constancy** (SEE Gestalt Psychology, Visual Perception, Perception)
- Consumer Behavior** (see also Advertising)
- Contagion** (SEE Interpersonal Influence, Social Influence)
- Content** (SEE Information, Meaning)
- Context**
2860, 2989, 3001
- Contraception** (SEE Birth Control)
- Contribution & Criticism**
2029, 2091, 2092, 2298, 2831, 2933, 2936, 3001, 3032, 3062, 3066, 3140, 3155, 3185, 3259, 3448, 3509, 3613, 3628, 3894
- Control** (see also Display)
- Control/Internal-External**
2197, 2235, 2489, 2770, 2931, 3022, 3034, 3038, 3039, 3061, 3069, 3191, 3396
- Convulsion** (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
- Cooperation**
2754, 2896, 2919, 2923, 2956, 2965, 2969, 2974, 2977
- Coordination** (SEE Motor Performance)
- Coping Behavior** (SEE Adjustment/Personal & Social)
- Copulatory Behavior** (SEE Sexual Behavior-Animal)
- Correlation** (see also Factor Analysis, Statistics)
2035, 2041, 2059, 2062, 2105, 3700, 3727
- Cortex** (SEE Cerebral Cortex, Visual Cortex)
- Counseling** (see also Guidance/Educational, Guidance/Vocational, Interview)
3158, 3203, 3208, 3236, 3334, 3500, 3503, 3510, 3511, 3512, 3513, 3514, 3515, 3517, 3518, 3519, 3520, 3522, 3523, 3526, 3528, 3671, 3759, 3761, 3762, 3763, 3764, 3769, 3770, 3771, 3773, 3774, 3776, 3777, 3778, 3779, 3780, 3781, 3784, 3785, 3789, 3792, 3793, 3794, 3795, 3799
- Counseling/College** (SEE Guidance/Educational, Guidance/Vocational)
- Counselor**
3147, 3523, 3786
- Counsellorship** (SEE Interpersonal Processes, Psychotherapy, Psychoanalysis, Therapeutic Process)
- Counting** (SEE Mathematics, Number)
- Couri** (SEE Law, Crime & Criminals)
- Courtship** (SEE Interpersonal Attraction)
- Creativity** (see also Aesthetics, Gifted, Literature, Music, Thinking)
2323, 2605, 2836, 3005, 3012, 3069, 3070, 3071, 3072, 3073, 3074, 3075, 3076, 3077, 3078, 3079, 3461, 3485, 3721, 3745, 3795, 3824, 3874
- Credibility** (SEE Experimentation & Experiments, Interpersonal Influence, Social Perception)
- Crime & Criminals** (see also Delinquency/Juvenile, Law, Prison)
2861, 2886, 3108, 3123, 3309, 3311, 3352, 3353, 3354, 3355, 3356, 3357, 3358, 3359, 3602
- Crisis & Crisis Intervention** (see also Community Services, Emotion)
2807, 3351, 3512, 3532
- Critical Flicker Fusion** (SEE Vision)
- Criticism** (SEE Contribution & Criticism)
- Cross-Cultural Differences** (see also Culture, Cultures & Countries)
2811, 2819, 2828, 2829, 2830, 2831, 2832, 2833, 2834, 2835, 2836, 2837, 2870, 2899, 3031, 3309
- Cue**
2142, 2150, 2154, 2162, 2189, 2234, 2293, 2443, 2662, 2727, 2958, 2983, 3236, 3629, 3657, 3752
- Cultural Anthropology** (SEE Culture)
- Cultural Disadvantage** (SEE Socioeconomic Status, Childhood/Disadvantaged)
- Culture** (see also Cultures & Countries, Ethnology, Social Influence)
2017, 2642, 2643, 2767, 2789, 2798, 2799, 2800, 2801, 2803, 2804, 2805, 2808, 2810, 2813, 2842, 2899, 2925, 2928, 2955, 3019, 3113, 3114, 3302, 3665
- Cultures & Countries** (see also Culture, Africa, Canada, France, Germany, Great Britain, India, Israel, Japan, Latin America, United States, USSR)
2636, 2734, 2744, 2761, 2762, 2767, 2772, 2773, 2789, 2794, 2802, 2811, 2823, 2832, 2833, 2834, 2841, 2863, 2870, 2910, 2970, 3031, 3041, 3084, 3091, 3093, 3112, 3248, 3301, 3309, 3322, 3379, 3406, 3606, 3719, 3943
- Curiosity** (SEE Motivation, Thinking)
- Curriculum** (see also School Administration, Mathematics, Reading)
2016, 2067, 3090, 3105, 3153, 3542, 3738, 3744, 3757, 3758, 3766, 3772, 3783, 3801, 3806, 3812, 3829, 3836, 3838, 3843, 3845, 3853, 3854, 3856, 3857, 3859, 3860, 3862, 3863, 3865, 3867, 3870, 3871, 3874, 3875, 3876, 3883, 3889, 3894
- Cutaneous Sense** (see also Skin)
- Cybernetics** (SEE Communication, Feedback, Computer)
- Dark Adaptation** (SEE Adaptation/Sensory)
- Data Processing** (SEE Computer, Statistics)
- Day Dreaming** (SEE Fantasy)
- Deafness & Hearing Disorder**
3545, 3546, 3547, 3548, 3549, 3550, 3744, 3745, 3746, 3747
- Death** (see also Suicide)
2456, 2757, 2788, 2840, 2842, 2866, 3056, 3120, 3416, 3677
- Death Penalty** (SEE Law)
- Deception**
2755, 2965, 3319, 3365, 3706, 3723, 3732, 3907
- Decision Making** (see also Choice Behavior, Game Learning, Probability)
2338, 2339, 2340, 2341, 2342, 2343, 2644, 2896, 2900, 2924, 2931, 2939, 2945, 2950, 3053, 3833, 3853, 3908, 3944
- Decoding** (SEE Categorical Behavior, Problem Solving, Display)
- Defecation** (SEE Elimination)
- Defense Mechanism** (see also Identification, Repression)
3043, 3055, 3172, 3306, 3389
- Defense/Perceptual** (SEE Defense Mechanism)
- Defensiveness** (SEE Defense Mechanism, Personality Trait)
- Deja Vu** (SEE Familiarity, Parapsychology)
- Delayed Reaction** (SEE Response)
- Delinquency/Juvenile** (see also Antisocial Behavior, Crime & Criminals)
2778, 3111, 3112, 3320, 3329, 3360, 3361, 3362, 3363, 3364, 3365, 3366, 3367, 3368, 3369, 3370, 3371, 3372, 3373, 3459, 3759
- Delirium** (SEE Mental Disorder, Neurosis, Psychosis)
- Delusion** (SEE Mental Disorder, Neurosis, Psychosis)
- Demographic Variables** (SEE Population Characteristics)
- Denial** (SEE Defense Mechanism)
- Dependency**
2208, 2235, 2236, 2634, 2745, 2763, 2777, 2779, 2807, 2830, 2929, 2963, 3060, 3069, 3273, 3339, 3405, 3536, 3649, 3708, 3855, 3944
- Depression** (see also Emotion, Emotional Disturbance)
3052, 3081, 3250, 3251, 3315, 3342, 3381, 3388, 3392, 3393, 3399, 3418, 3419, 3678, 3770

BRIEF SUBJECT INDEX

- Deprivation** (see also Deprivation/Sensory, Food Deprivation, Isolation, Rat/Deprivation in)
2188, 2505, 2526, 3283, 3699
- Deprivation/Sensory**
2525, 3171, 3533
- Depth Perception** (SEE Perception/Depth)
- Desegregation** (SEE Integration)
- Desensitization Therapy** (SEE Behavior Therapy)
- Detection**
2053, 2116, 2121, 2140, 2162, 2167, 2174, 2176, 2207, 2209, 2211, 2216, 2217, 2218, 2299, 3049, 3054, 3921, 3923, 3924, 3927, 3932
- Developing Countries** (SEE Cultures & Countries)
- Development** (see also Childhood/Development in, Language Development, Maturation)
2444, 2462, 2601, 2604, 2609, 2611, 2844, 3037, 3373, 3503
- Dexterity** (SEE Hand, Motor Performance)
- Diabetes** (SEE Blood, Disease)
- Diagnosis** (see also Psychodiagnosis, Schizophrenia/Diagnosis of, Mental Retardation/Diagnosis of)
3323, 3559, 3589, 3662
- Diagnosis/Differential**
3308, 3317, 3318, 3322, 3442, 3587, 3588
- Dial** (SEE Display)
- Diet** (SEE Food)
- Differential Reinforcement at Low Rates of Responding** (SEE Reinforcement Schedule)
- Digestive System** (see also Metabolism)
2347, 2408, 2504, 2505, 2506, 2526
- Digit** (SEE Number)
- Disability** (SEE Physical Handicap)
- Disarmament** (SEE War, International Relations)
- Discrimination** (see also Auditory Discrimination, Learning/Discrimination, Visual Discrimination, Rat/Discrimination in)
2026, 2255, 2264, 2317, 2653, 2665, 3849
- Discrimination Learning** (SEE Learning/Discrimination)
- Discrimination Reversal**
2665, 2669
- Discrimination/Racial** (SEE Integration, Prejudice, Social Movements)
- Disease** (see also Illness)
2272, 3123, 3152, 3178, 3291, 3473, 3474, 3584, 3650, 3652, 3653, 3659
- Displacement** (SEE Defense Mechanism)
- Display** (see also Control)
2133, 2218, 3920
- Dissonance** (see also Attitude Change)
2826, 2874, 2944, 3720, 3833, 3955
- Distance** (SEE Perception/Depth)
- Distraction** (SEE Attention)
- Diurnal Rhythms** (SEE Biological Rhythms)
- Divorce** (SEE Marital Problems)
- DNA** (SEE Biochemistry)
- Dog**
- Dogmatism** (SEE Authoritarianism, Personality Trait)
- Dominance** (see also Authoritarianism)
2776, 2918, 2961, 3452, 3525
- Double Blind Design** (SEE Experimental Design)
- Down's Syndrome** (SEE Genetics, Mental Retardation)
- Draft** (SEE Military)
- Draw-a-Man Test** (SEE Projective Technique)
- Draw-A-Person Test** (SEE Projective Technique)
- Drawing** (see also Aesthetics, Creativity, Picture)

3133, 3327, 3344, 3377, 3412, 3415, 3426,

BRIEF SUBJECT INDEX

- 3446, 3586, 3658, 3793
Eugenics (SEE Genetics)
Evaluation (see also Work & Work Analysis)
 2271, 2881, 3326, 3687, 3784, 3856, 3867
Evoked Potential (SEE Potential/Evoked)
Evolution (SEE Comparative Psychology, Science, Theory)
Examination (SEE Educational Measurement, Test/Achievement, Test & Testing)
Exceptional Child (SEE Education/Special, Education/Special-Remedial, Education/Special-Mental Retardation, Gifted, Childhood/Handicapped)
Excitation (SEE Inhibition, Potential/Evoked, Stimulation)
Excretion (SEE Elimination)
Executive (SEE Management)
Exercise (SEE Work)
Exhibitionism (SEE Sexual Deviation)
Existential Psychology & Psychiatry (SEE Existentialism)
Existentialism
 2006
Expectation & Expectancy (see also Aspiration, Set)
 2049, 2233, 2244, 2340, 2602, 2642, 2770, 2839, 2884, 2963, 2978, 3240, 3337, 3693, 3720, 3841
Experience (see also Familiarity, Practice)
 1992, 2002, 2593, 2754
Experience/Early
 2347, 2362, 2462, 2478, 2497, 2513, 2514, 2515, 2516, 2525
Experimental Design
 2069, 2093, 2203, 2607, 2661, 3008, 3887
Experimental Psychology
 2097
Experimentation & Experiments (see also Research, Research Methods)
 2000, 2090, 2210, 2437, 2601, 2965, 3920
Experimenter Bias (SEE Bias, Experimentation & Experiments)
Expert Testimony (SEE Law, Clinical Judgment)
Exploratory Behavior (see also Rat/Activity in)
 2188, 2388, 2450, 2464, 2486
Extinction (see also Extinction/Resistance to, Inhibition, Learning, Rat/Extinction in)
 2241, 2422, 2546, 3191, 3220
Extinction/Resistance to
 2545, 2577
Extrasensory Perception (SEE Parapsychology)
Extroversion-Introversion
 2499, 2732, 2941, 3021, 3043, 3049, 3054, 3110, 3354, 3435, 3647, 3721
Eye (see also Retina, Vision)
 2101, 2114, 2192, 2243, 2315, 2427, 3660
Eye Movement (see also Rapid Eye Movement)
 2157, 2158, 2159, 2184, 2627, 3085, 3837
Eyelid Conditioning (SEE Conditioning/Eyelid)
Facial Expression (SEE Communication/Nonverbal, Social Perception)
Factor Analysis (see also Correlation)
 2033, 2063, 2064, 2089, 2697, 2758, 2881, 3067, 3086, 3096, 3097, 3098, 3099, 3101, 3315
Faculty (SEE Teacher)
Failure (SEE Achievement, Emotion, Anxiety)
Faking (SEE Deception)
Familiarity (see also Experience, Practice)
 2101, 2124, 2194, 2228, 2309, 2311, 2625, 2700, 3840
Family (see also next headings, Marriage, Mother, Father)
 2642, 2740, 2761, 2772, 2807, 2841, 2855, 2871, 2922, 3073, 3265, 3266, 3326, 3357, 3360, 3379, 3383, 3402, 3520, 3608, 3704, 3788
Family Planning (SEE Birth Control)
Family Relations (see also Parent-Child Relations)
 2765, 2772, 2777, 2815, 2838, 2870, 3036, 3139, 3172, 3202, 3329, 3332, 3402, 3466, 3609, 3766, 3828
Family Therapy
 3163, 3202, 3212, 3214, 3410, 3524, 3527, 3528
Fantasy (see also Dream & Dreaming, Imagery)
 2157, 2649, 2728, 2952, 3078, 3215, 3352, 3397, 3454, 3884
Farming (SEE Rural Environment, Occupation)
Father (see also Parent-Child Relations)
 2599, 2760, 3525, 3819
Fatigue
 3931
Fear (see also Anxiety, Emotion, Motivation, Phobia, Threat)
 2193, 2443, 2464, 2560, 2866, 3029, 3036, 3056, 3220
Feeble-mindedness (SEE Mental Retardation)
Feedback (see also Reinforcement)
 1997, 2183, 2189, 2190, 2213, 2214, 2254, 2269, 2489, 2602, 2683, 2696, 2892, 2912, 2982, 3049, 3216, 3316, 3441, 3688, 3702, 3832, 3921
Feeding (SEE Food Intake)
Feeling (SEE Emotion)
Femininity (SEE Sex Role)
Fetishism (SEE Sexual Deviation, Sexual Disorder)
Fetus (SEE Pregnancy)
Field Dependence (SEE Dependency)
Field Study (SEE Research Methods, Observation)
Fighting (SEE Aggression, Hostility)
Figural Aftereffect (SEE Aftereffect)
Figure (SEE Stimulus, Pattern, Perception/Form & Shape)
Film
 2098, 2743, 3070, 3557, 3869, 3879
Fine Arts (SEE Aesthetics, Literature, Music)
Finger (SEE Hand, Motor Performance, Body)
Fish
 2437, 2512, 2580, 2588, 2589
Flavor (SEE Taste)
Flicker Fusion (SEE Vision)
Food
 2483, 3424, 3595, 3627
Food Deprivation
 2135, 2347, 2494, 2520, 2522, 2563, 2593
Food Intake
 2351, 2369, 2381, 2390, 2402, 2506, 2520, 2521, 2523, 2529, 2540, 2562, 2563, 2588, 3417, 3484, 3657
Food Preference (SEE Food Intake)
Forced Choice (SEE Choice Behavior, Item, Response, Testing Methods)
Foreign Relations (SEE International Relations)
Foreman (SEE Management)
Forgetting (SEE Extinction, Learning, Memory, Retention)
Form Perception (SEE Perception/Form & Shape)
Foster Home (SEE Family, Community Services)
France
 2924, 3031
Freud/S. (SEE Psychoanalysis, Psychoanalytic Theory)
Friendship (SEE Interpersonal Processes, Interpersonal Attraction)
Frigidity (SEE Sexual Disorder)
Frog
Frontal Lobotomy (SEE Brain Lesion, Brain Lesion-Animal)
Frustration (see also Aggression, Conflict, Emotion)
 2201, 2522, 2528, 2573, 2574, 2575, 2734, 2782, 2783, 2952, 3107, 3139
Galvanic Skin Response
 2236, 2291, 2416, 2417, 2420, 2422, 2448, 2502, 2612, 3125, 3132, 3460, 3462, 3601, 3610
Game (see also Recreation)
 2222, 2337, 2755, 2888, 2923, 2936, 2976, 2977, 3065, 3877
Game Theory (SEE Choice Behavior, Decision Making, Learning/Probability)
Gastrointestinal Processes (SEE Digestive System)
Generalization
 1991, 2114, 2245, 2250, 2585, 2814, 3042, 3217, 3218, 3849
Generalization/Stimulus (SEE Transfer, Generalization)
Genetics
 2008, 2019, 2069, 2435, 2496, 3063, 3123, 3131, 3435, 3478, 3593, 3596, 3600, 3606, 3620, 3621, 3627, 3630, 3650
Genetics-Animal
 2019, 2368, 2453, 2486, 2497, 2517, 2590, 2592
Genius (SEE Gifted)
Geriatrics (see also Gerontology)
 3676, 3677, 3678, 3679, 3680
Germany
 2833, 2836, 2924, 2979, 3521
Gerontology (see also Geriatrics)
 2785, 2787, 2789, 2869, 3497
Gestalt Psychology
 3214
Gifted
 2650, 3787, 3874
Gland (see also Epinephrine, Hormone)
 2364, 2441
Goal (SEE Motivation)
Goodenough Test (SEE Projective Technique)
Government
 2014, 2392, 2807, 2811, 2818, 2843, 2878, 3041
Grades & Grade-Point Average (SEE Achievement/Academic, Achievement/Academic-College, Achievement/Academic-Elementary School)
Grammar
 2258, 2307, 2676, 2694, 2989, 2991, 2992, 3835
Graphology (SEE Writing)
Great Britain
 2018, 2831, 2833, 2836, 3590
Group (see also next headings, Community, Culture, Interpersonal Processes)
 2749, 2826, 2829, 2897, 2898, 2900, 2904, 2906, 2907, 2909, 2910, 2912, 2914, 2920, 2931, 2935, 2940, 3028, 3191, 3522, 3774, 3780, 3799, 3805, 3828, 3873, 3935
Group Discussion
 2892, 2895, 2942, 2947, 3452, 3489, 3721
Group Dynamics
 2608, 2818, 2889, 2891, 2897, 2906, 2907, 2910, 2912, 2914, 2927, 2931, 2937, 2939, 2940, 2942, 2945, 2947, 2949, 2950, 2968, 3780, 3921
Group Influence (SEE Social Influence)
Group Structure (SEE Group, Role)
Group Therapy (SEE Psychotherapy/Group)
Group/Ethnic (SEE Ethnology)
Group/Small (see also Interpersonal Processes)
 2890, 2893, 2911, 2918, 2920, 2921, 2924, 2937, 2942, 2947, 2948, 2950, 2984, 3079, 3209, 3267, 3452, 3789, 3811
Guidance (SEE next headings, Counseling)
Guidance/Child (SEE Psychotherapy Children, Guidance/Educational)
Guidance/Educational
 3760, 3762, 3764, 3769, 3770, 3771, 3772, 3773, 3775, 3776, 3777, 3779, 3780, 3781, 3784, 3789, 3790, 3792, 3794, 3797, 3798, 3799, 3833
Guidance/Vocational
 3516, 3758, 3764, 3768, 3783, 3788, 3791, 3795, 3797, 3798, 3901, 3905
Guilt (SEE Emotion, Motivation)
Guinea Pig (SEE Animals)
Gustation (SEE Taste)
Habit (SEE Learning, Extinction)

BRIEF SUBJECT INDEX

Habituation
2370, 2530, 2532, 2614, 3601, 3685

Hallucination
3413, 3312, 3482

Hallucinogen (SEE Drugs, Lysergic Acid Diethylamide)

Halo Effect (SEE Rating Scale)

Hand (see also Body, Motor Performance)
2645

Handedness (SEE Laterality)

Handicap (SEE Childhood/Handicapped, Physical Handicap, Blindness, Deafness & Hearing Disorder)

Handling (see also Experience/Early)
2362, 2514

Handwriting (SEE Writing)

Headache (SEE Illness)

Hearing (SEE Audition)

Hearing Loss (SEE Audition, Deafness & Hearing Disorder)

Hearing/Hard of (SEE Deafness & Hearing Disorder)

Heart (see also Blood, Blood-Animal, Blood Pressure, Cardiovascular Processes, Heart Rate)
2482

Heart Rate
2196, 2482, 2489, 2502, 2628, 3375

Heat (SEE Temperature)

Height (SEE Physique)

Helping Behavior (SEE Interpersonal Processes)

Heredity (SEE Genetics)

High School (SEE School, Student/High School, Adolescence)

Higher Education (SEE College)

Hippocampus

2158, 2366, 2380, 2182, 2383, 2400, 2402, 2404, 2426, 2467, 2479, 2480

History (see also Psychology/History of)
2805, 2924

Hoarding (SEE Instinctive Behavior)

Homicide (SEE Crime & Criminals, Suicide)

Homosexuality

2752, 3374, 3377

Honesty (SEE Deception)

Hormone (see also Epinephrine)

2364, 2387, 2440, 2441, 2442, 2443, 2444, 2492, 3376, 3653

Hospital & Hospitalization (see also Clinic, Institution & Institutionalization, Mental Hospital & Hospitalization)

3115, 3144, 3268, 3291, 3602, 3648

Hostility (see also Aggression)

3046, 3054, 3311

Hue (SEE Color)

Human Engineering (SEE Engineering Psychology)

Humor (see also Literature, Language, Emotion)
2196, 2737, 3048

Hunger (SEE Food Deprivation, Motivation)

Husband (SEE Marriage)

Hypnosis

2181, 2184, 2185, 2186, 2187, 3080, 3477

Hypnotherapy (SEE Hypnosis, Psychotherapy/Methods in)

Hypothalamus

2381, 2384, 2385, 2387, 2389, 2402, 2403, 2405, 2467, 2470, 2471, 2500, 2504, 3338

Hysteria & Hysterics (see also Mental Disorder, Neurosis, Psychosis)

3380, 3391, 3397, 3414, 3588, 3678

Id (SEE Psychoanalytic Theory)

Identification

2099, 2207, 2988, 3195, 3787, 3839, 3873, 1921

Identify

1985, 1988, 2328, 2777, 2890, 3011

Illegitimate Pregnancy (SEE Pregnancy, Mother)

Illness (see also Disease)

3107, 3129, 3131, 3441, 3472, 3644, 3645,

3646, 3647, 3653, 3654, 3656, 3657, 3658, 3659

Illusion (SEE Brightness, Environment)

Illusion
2106, 2107, 2108, 2109, 2110, 2128, 2723, 2725

Image (see also Self-Perception, Social Perception, Body)

2988, 3880, 3923

Imagery

2184, 2289, 2324, 2605, 2677, 3078, 3223, 3583, 3679, 3926, 3927

Imagination (SEE Fantasy, Cognition, Thinking)

Imitation (see also Instinctive Behavior, Interpersonal Processes, Model)

2616, 2694, 2705, 2748, 3395

Impression Formation (SEE Social Perception)

Imprinting (SEE Instinctive Behavior, Experience/Early)

Incentive (see also Motivation, Reward, Reinforcement)

2214, 2336, 2565, 2569, 2892, 3051, 3946

Incest (SEE Sexual Deviation)

Incidental Learning (SEE Learning)

Income (SEE Money, Socioeconomic Status)

Independency (SEE Dependency)

India

2819, 2828, 2834, 2856, 3104

Indian/American (SEE Ethnology)

Individual Differences

2002, 2197, 2199, 2208, 2280, 2953, 3002, 3020, 3047, 3071, 3709, 3916

Industrial Psychology (see also Business, Personnel/Industrial)

2801, 3896, 3897, 3899, 3900

Industry (SEE Business, Personnel, Industrial)

Infancy (see also Neonate)

2613, 2614, 2615, 2616, 2617, 2619, 2620, 2622, 2623, 2624, 2625, 2626, 2628, 2639, 2764

Influence (SEE Interpersonal Influence, Persuasion, Social Influence)

Information (see also Communication, Information Theory, Language)

1992, 2075, 2076, 2105, 2141, 2189, 2163, 2207, 2208, 2275, 2301, 2308, 2315, 2318, 2319, 2321, 2428, 2531, 2602, 2611, 2688, 2774, 2891, 2896, 2911, 2912, 2921, 2972, 2998, 3053, 3061, 3440, 3504, 3582, 3616, 3843, 3908, 3926, 3966

Information Retrieval (SEE Information Computer)

Information Theory (see also Information)

1980, 2133, 2328

Inheritance (SEE Genetics)

Inhibition (see also Extinction, Interference)

2114, 2307, 2408, 2410, 2422, 2437, 2439, 2547, 2568, 3072, 3818

Inkblot (SEE Projective Technique, Rorschach Test)

Insect

2350, 2474, 2508

Insecurity (SEE Dependency, Neurosis)

Insight (SEE Problem Solving, Thinking, Self-Perception, Social Perception, Therapeutic Process)

Instinctive Behavior (see also Sexual Behavior, Animal)

2007, 2517, 2548

Institute (SEE Organization, College)

Institution & Institutionalization (see also Hospital & Hospitalization, Mental Hospital & Hospitalization)

2742, 3266, 3286, 3306, 3409, 3410, 3446, 3590, 3608, 3614, 3615, 3615, 3625

Instruction (see also Teaching)

3222, 3552, 3891

Instructions/Experimental

2120, 2121, 2209, 2208, 2210, 2211, 2222, 2288, 2292, 2296, 2422, 2648, 2668, 2675, 2715, 3042, 3337, 3367, 3654

Insulin (SEE Hormones)

Insulin Shock Therapy (SEE Therapy)

Integration
2841, 2843

Intellectual Processes (SEE Cognition, Think

ing)

Intelligence (see also next headings)

2272, 2321, 2644, 2666, 2756, 3017, 3050, 3051, 3066, 3117, 3118, 3119, 3120, 3121, 3122, 3123, 3124, 3125, 3126, 3127, 3128, 3129, 3130, 3131, 3132, 3133, 3134, 3135, 3136, 3137, 3138, 3139, 3140, 3141, 3142, 3143, 3144, 3145, 3146, 3147, 3148, 3149, 3150, 3151, 3152, 3153, 3154, 3155, 3156, 3157, 3158, 3159, 3160, 3161, 3162, 3163, 3164, 3165, 3166, 3167, 3168, 3169, 3170, 3171, 3172, 3173, Abbreviations appearing in this issue include along with units of measurement (e.g., in. = inch, wk. = week, hr. = hour, etc.):

AA = Alcoholics Anonymous
AC = alternating current
ACTH = adrenocorticotrophic hormone
AM = ante meridiem
amp. = ampere

bpm = beats per minute

C = centigrade
¢ = cents
CA = chronological age
cc = cubic centimeter
CE-R = conditioned emotional response
CHF = critical flicker frequency
CNS = central nervous system
cps = cycles per second
CR = conditioned response (or reflex)
CRF = continuous reinforcement
CRT = cathode ray tube
CS = conditioned stimulus
CVC = consonant-vowel-consonant

db. = decibel
DC = direct current
DL = differential limen
DNA = deoxyribonucleic acid
DRL = differential reinforcement of low rates

E = experimenter
ECS = electroconvulsive shock
EEG = electroencephalogram (or -graphy)
EKG = electrocardiogram
EMG = electromyogram
ESP = extrasensory perception
Exp. = experiment

F = Fahrenheit
ft-c = foot-candle
ft-L = foot-lambert

g = gravity
gm. = gram(s)
GPA = grade-point average
GSR = galvanic skin response

Hz. = Hertz

ICS = intracranial stimulation
im = intramuscularly
ip = intraperitoneally
IQ(s) = intelligence quotient(s)
ITI = intertrial interval
iv = intravenously

kc. = kilocycle
kg. = kilogram
kg/m = kilogram per meter
kHz. = kilo-Hertz

LD = lethal dose
LSI = lysergic acid diethylamide

m. = meter
M = mean
M = mole or molar
ma. = milliamperes
MA = mental age
MAO = monoaminooxidase
mL. = millilambert
mm. = millimeter
mph = miles per hour
msec. = millisecond(s)

N = number
NREM = nonrapid eye movement

O = observer

p = probability
% = percent

PM = post meridiem
pps = pulses per second
PRE = partial reinforcement effect
PSE = point of subjective equality
psi = pounds per sq. in.

r = product-moment correlation
r = roentgen
REM = rapid eye movement
rms = root mean square
RNA = ribonucleic acid
rpm = revolutions per minute
RT = reaction time

S = subject
SEU = subjectively expected utility
SPL = sound pressure level

TV = television

UCR = unconditioned response
UCS = unconditioned stimulus
UHF = ultrahigh frequency

V = volt
VHF = very high frequency
vs. = versus

YMCA = Young Men's Christian Association
YWCA = Young Women's Christian Association

Test abbreviations include:

California F. Scale (Ethnocentrism)
California F Scale (Fascism)
CMA scale = Children's Manifest Anxiety scale
CPI = California Psychological Inventory
CTMM = California Test of Mental Maturity
EPPS = Edwards Personal Preference Schedule
MA scale = (Taylor) Manifest Anxiety scale
MMPI = Minnesota Multiphasic Personality Inventory
MPI = Maudsley Personality Inventory
16 PF = Cattell's 16 Personality Factor Questionnaire
SVIB = Strong Vocational Interest Blank
TAT = Thematic Apperception Test
WAIS = Wechsler Adult Intelligence Scale
WISC = Wechsler Intelligence Scale for Children

Abbreviations used in authors' addresses are:

Assn. = association
Assoc. = associates
Co. = company
Coll. = college
Corp. = corporation
Dept. = department
Div. = division
Inst. = institute
Hosp. = hospital
Lab. = laboratory
Inc. = incorporated
U. = university

Ave. = avenue
Bldg. = building
Bld. = boulevard
Ct. = court
Dr. = drive
Ft. = fort
Mt. = mount
Pkwy. = parkway
Pl. = place
PO = post office
Rd. = road
St. = street
N, S, E, W = North, South, East, West
U.S. = United States
USSR = Union of Soviet Socialist Republic

GENERAL

OBITUARIES

HISTORY

3961. **Larson, Cedric A.** (Rutgers State U.) **Watson and Yerkes: A friendship that spanned thirty years.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 723-724. This paper is based on several hundred personal letters that passed between Robert M. Yerkes (1876-1956) and John B. Watson (1878-1958) from 1904-1933. These letters give an insight into their private and academic lives which cannot be gained from a formal biographical sketch. As the years went by, the tone and intimacy of the Yerkes-Watson letters remained constant, and there never seems to have arisen any shadow of disagreement or misunderstanding. If a judgment may be made from the correspondence that has come down in 1 form or another, Watson's 2 firmest friends in the field of psychology were Edward B. Titchener and Robert M. Yerkes. They remained close friends of Watson long after he left the academic world of psychology in 1920. The correspondence gives an insight into the more deeply human aspects of these early pioneers of American psychology.—*Author abstract*.

3962. **Sipos, István.** (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **Egy pszichológiai pályatétel Magyarországon a XIX Század első**

felében. [A psychological competition theme in Hungary in the first half of the XIXth century.] *Pszichológiai Tanulmányok*, 1968, No. 11, 767-782. Analyzing the 3 papers that achieved top rank in the competition by the Hungarian Academy of Science in 1834, the main trends in the educational psychological literature of Reform-Age Hungary are recounted. Reference is made to foreign influences, the empirical psychology prevailing at that time, and its impact on the developing literature. Outstanding traits in the psychology of the Reform Age are summed up as follows: (a) recognition of the social importance of psychology, (b) wide interest for the possibilities of application, (c) emphasis on the need for its employment in the field of public education, and (d) the birth of an extensive educational and psychological literature. The most important ideas bearing on educational psychology are underlined. A short treatment of methodological problems is followed by reference to other fields of interest (physiological, characterological, etc.) treated in the psychological literature of the Reform Age in Hungary.—*English summary*.

3963. **Smith, Noel W.** (State University Coll. New York, Plattsburg) **Belief systems and psychological concepts of ancient Egypt to the end of the Old Kingdom (2200 BC).** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 721-722.—The period is one of a strong sense of security and of happiness with life. The belief system is naturalistic with special powers and mythological features being of superhuman rather than supernatural character. The psychological concepts of ba, ka, khaibut, and akh are modes of being and represent concrete forms of existence and of animistic powers of the individual in life and afterlife. A extant document of a direct psychological nature appears in this oldest dynastic period. The period ends with chaos and destruction of some of the traditional institutions and concepts that provided stability and security. Resulting psychological changes occur.—*Author abstract*.

PHILOSOPHY

3964. **Bradley, Gerald P.** (Northwestern U.) **The Freudian theories of anxiety: A phenomenological critique.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3592.

3965. **Brown, Geoffrey W.** (Washington U.) **The concept of psychological abnormality: A philosophical analysis of its normative commitments.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3592-3593.

3966. **Brown, Harold I.** (Northwestern U.) **A causal theory of perception.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3593.

3967. **Lambley, Peter.** (U Cape Town, South Africa) **Scientific status of technical eclecticism: A critical note.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 91-97. Attempts to clarify claims that technical eclec-

ticism is nonscientific. It is argued that modern philosophy of science has more in common with the work of A. Lazarus (see PA, Vol. 42:4724) than with his "scientific" critics. However, the underlying assumption of empiricism that characterizes technical eclecticism is noted, and suggestions are made in the hope of drawing clinician's attention to an orientation more broadly based. (55 ref.)—*Journal abstract.*

3968. Lapointe, Francois H. (Auburn U.) **The phenomenal body in the later writings of Merleau-Ponty.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 251-265.—Merleau-Ponty rejects the subject-object dichotomy. The original experience includes the union of the two. Merleau-Ponty interprets the modern evolution of thought as leading to a rejection of dualism, and he sees the victory over the opposition between body and mind as the most striking characteristic of philosophical thought in our century. He has shown that bodily being is already existence, openness to and dialogue with the world. The body "understands" its world, it is permeated with intentions and thereby gives meaning to his surroundings. In attempting to overcome the historical tradition of philosophical dualism, Merleau-Ponty posits the term "being-in-the-world," a preobjective view which effects in man the union of the psychic and the physiological. That which makes the body human, which makes it be a phenomenal body, and not just a thing or an objective body, is the crisscrossing in it of seeing and seen, touching and touched—even of seeing and touching. (16 ref.)—*Author abstract.*

3969. Ross, Barbara C. (U. New Hampshire) **Psychological thought within the context of the scientific revolution, 1665-1700.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3603.

3970. Van Kaam, Adrian. (Duquesne U.) **Existential crisis and human development.** *South African Journal of Pedagogy*, 1969(Jul), Vol. 3(1), 63-74. Discusses existential death and rebirth as a fundamental process of human development or self-emergence. The latter are marked by crises which all men experience to a greater or lesser degree. The emergence to these moments of crises in counseling and therapy are discussed and personal crisis is regarded as a polar conflict within the personality caused by what the S is and by what he ought to be. Existential crisis is established as a sequence of psychological death, decision, and rebirth. However, a negative phase (failure to experience rebirth) and a positive phase (rebirth) are distinguished. The latter is characterized by the struggle toward self-identity and the realization of hidden potentialities.—*P. Hertzberg.*

PARAPSYCHOLOGY

3972. Beloff, John. (U. Edinburgh, Scotland) **Parapsychology and its neighbors.** *Journal of Parapsychology*, 1970(Jun), Vol. 34(2), 129-142.—With regard to basic procedural practices, there are no distinctions between parapsychology and the more "established" sciences—physical, biological, or behavioral. But in the matter of conceptual aspects there are great differences, which perhaps cannot be bridged. Those who try to minimize the gap between mind and matter by the argument that modern physics is becoming less materialistic overlook the fact that, in spite of all the changes

in the concept of matter, the essential core of theoretical physics, as represented by the laws of invariance, still stands. On the other hand, those who contend that the findings of parapsychology will eventually be in keeping with the laws of physics and chemistry are side-stepping the fact that the energetics of the psi process are not the fundamental problem. The informational aspects of psi, i.e., the question of how the S can isolate his psi target from all other possible psi targets after he has surmounted the various physical barriers, are considered baffling. Since so much is known about the physical world and so little about psi, parapsychologists should resist the urge for a close alliance with the other sciences and remain open-minded.—*Journal abstract.*

3973. Cashen, Valjean M. & Ramseyer, Gary C. (Illinois State U.) **ESP and the prediction of test items in psychology examinations.** *Journal of Parapsychology*, 1970(Jun), Vol. 34(2), 117-123.—32 undergraduates in a general psychology course were the Ss in an experiment testing the hypothesis that Ss who scored high on an ESP test would be able to predict the items in forthcoming psychology examinations and therefore get better course grades than Ss who made low scores in the ESP test. Ss were separated into high- and low-scorers on the basis of a GESP card test in which the E looked at a deck of ESP cards, 1 by 1, and the group of Ss wrote down their guesses. There were 3 multiple choice or true-false examinations during the semester, and on the day of each exam, the S was asked to hand in a list of the "stems" of the items which he thought would be included in the test. The high-scoring ESP Ss guessed significantly more items than the low-ESP scorers ($p < .001$). In spite of this, there was no appreciable difference in the total number of course points earned by the 2 groups.—*Journal abstract.*

3974. Krippner, Stanley. (Maimonides Medical Center, Brooklyn, N.Y.) **"Clairvoyant" perception of art prints in altered consciousness states.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 423-424.—During 32 sessions, 4 "psychic sensitives" attempted to determine the contents of sealed envelopes in the waking state, in a meditative state, and seated in a "sensory bombardment" chamber. 3 judges, working blind and independently, ranked written transcripts of Ss' statements against 4 targets in a "pool" randomly selected for each session. As there were 3 conditions for each session, the 4 Ss produced 96 trials. Using median ranks, the judges awarded a total of 58 "hits" and 38 "misses" ($CR = 2.04$, $p < .04$, 2-tailed). The trials conducted in the "sensory bombardment" chamber were independently significant ($CR = 2.48$, $p < .013$, 2-tailed).—*Author abstract.*

3975. Nielsen, Winnifred. (Inst. for Parapsychology, Durham, N.C.) **Relationships between precognition scoring level and mood.** *Journal of Parapsychology*, 1970(Jun), Vol. 34(2), 93-116.—Confirms earlier findings on the relation of mood (moderate/extreme, pleasant/unpleasant) to scoring level in precognition tests. Undergraduates were assigned to personality groups (introvert/extrovert) and attitude groups (belief and interest in ESP) on the basis of responses to a personality questionnaire and to 4 questions on attitude. There were 9 "interested sheep" (3 introverts and 6 extroverts), 4 "interested open-minded" (1 introvert and 3 extroverts), and 1 "noninterested sheep" (extrovert). Ss completed 12 3-run precognition sessions at home, rating their moods at each session. Analyses were based on comparisons

between interested Ss only. The "sheep" scored higher in extreme than moderate moods ($p < .005$), and much of this difference was contributed by the introverts. The highest average run score for "sheep" was in extremely unpleasant mood conditions. Exactly opposite scoring trends were found for the "open-minded" Ss, who obtained their lowest scores in extreme moods and their most negative run-score averages in extremely unpleasant moods. The difference in scoring levels between "sheep" and "open-minded" in relation to mood was significant at the level of $p < .005$.—*Journal abstract.*

3976. Sarafin, G. Z. Ponyatie "bespokoistvo" v èkzistentsial'noi teologii P. Tillich. [The concept of "anxiety" in the existential theology of P. Tillich.] In V. P. Rozhin (Ed.), "Filosofskie i sotsiologicheskie issledovaniya." (See PA, Vol. 45:7193) 212-216.—Examines Tillich's concepts of "anxiety" and the "courage to be." Tillich, after establishing the difference between neurotic and existential anxiety, is said to distinguish 3 forms of the latter: (a) anxiety over fate and death, (b) anxiety over guilt and condemnation, and (c) anxiety over emptiness and meaninglessness. Tillich is criticized for "exaggerating the role of the subjective (social-psychological) factor" in history.—*I. D. London.*

3977. Talamonti, Leo. Appunti per una teoria dei rituali, in rapporto a particolari fenomeni di interesse parapsicologico: I rituali e i loro effetti. [Notes for a theory on rituals, in relationship to certain phenomena of parapsychological interest: Rituals and their effects.] *Rassegna Italiana di Ricerca Psicica*, 1970, No. 1, 7-55.—Includes general observations of rites and their reason for existence. The psychic forces involved and the unexplainable effects which are derived are emphasized. There is the possibility that rites can aid "magical creativity," which is an act of the human psyche in relation to nature. Various rites are cited: those conferring blessings and others involving hate, as well as the diabolical, political, liturgical, and spiritual rites. In all of these, the power of the "collective mind" is evident. Rituals indicate the eternal need in man for auto-transcendence "to break the barriers of the ego in order to become a part of something greater." (5 p. ref.)—*A. M. Faraglia.*

3978. Thouless, Robert H. & Brier, Robert M. (2 Leys Rd., Cambridge, England) *The stacking effect and methods of correcting for it.* *Journal of Parapsychology*, 1970(Jun), Vol. 34(2), 124-128.—Occasionally it is practicable to use an ESP test in which all the Ss make their calls for the same set of targets instead of for individual sets. When a single set is used for the group, it is necessary to make a statistical correction to compensate for the possibility that the Ss may share the same calling bias and that this may coincide with (or deviate from) the target order and give spuriously high (or low) results (the "stacking effect"). 1 of the methods of correction was worked out by T. N. Greville. Other Es have allowed for the stacking effect by merely reducing their critical ratios by 10%, a simplification which lacks theoretical justification. 2 other methods evaluating these multiple-calling experiments are the majority-vote technique and the use of the "index of preference."—*Journal abstract.*

3979. Ullman, Montague & Krippner, Stanley. (Maimonides Medical Center, Brooklyn, N.Y.) *ESP in the night.* *Psychology Today*, 1970(Jun), Vol. 4(1), 46-50, 72. REMs of sleeping Ss were monitored while another individual concentrated on an art print in an effort to

influence the Ss' dreams. 10 of 12 Ss ranked the target print with the 1/2 of the prints most like his dreams. A series of illustrations of how dreams conform to the pictures are given.—*E. J. Posavac.*

THEORY & SYSTEMS

3980. Garan, D. G. *Relativity for psychology: A causal law for the modern alchemy.* New York, N.Y.: Philosophical Library, 1968. 338 p.

3981. Luria, A. R. (Moscow State U., USSR) *Ideya sistemnosti v sovremennoi psikhologii.* [The idea of systemicity in contemporary psychology.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 353-358.—Anokhin's concept of functional systems in physiology is held to be of fundamental significance to psychology. It is indispensable for an understanding of the development of psychological processes in ontogenesis. The systems approach to psychological processes, proposed in the concepts of L. S. Vygotskii are described, and the place of these concepts in modern psychology is discussed. The effect of the systems approach on past solutions to the problem of cerebral mapping of mental functions is also discussed. (English summary)—*I. D. London.*

3982. Sicilian, Orazio. (U. Padua, Inst. of the Psychiatric Clinic of Verona, Italy) *Energia psichica o informazione? Evoluzione storica e attuale revisione del concetto di "energia psichica."* [Psychic energy or information? Historical evolution and recent revision of the concept of "psychic energy."] *Rivista di Psichiatria*, 1970(May), Vol. 5(3), 175-223.—The concept of "information" in the sense of an interdisciplinary scientific approach involving neurophysiology, neuropsychology, and neurocybernetics is to replace that of "psychic energy." In this way psychic phenomena are conceived in terms of a natural and biological substratum. Originally this was Freud's intention but this was set aside by the anthropoanalytical development of psychoanalysis. The concept of "information" involves a different approach to psychodynamics: it conceives of energy in terms of drives, ego development, mechanisms of defense, and traits of personality. (English summary) (173 ref.)—*N. De Palma.*

EDUCATION & TRAINING

3983. Riegel, K. F. (U. Michigan) *A structural, developmental analysis of the Department of Psychology at the University of Michigan.* *Human Development*, 1970, Vol. 13(4), 269-279. The history of the Department of Psychology at the University of Michigan was analyzed by relying on the number of PhDs granted and on the changing compositions of the PhD committees. Beginning with the 1st PhD of 1906, there was a slow, linear increase in the number of PhDs until 1924. Thereafter the increase was much steeper, though still linear, with large proportions of women receiving their degrees. A still steeper linear increase occurred after 1949. With the increase in the number of degrees granted the departmental staff expanded. An analysis of the composition of the PhD committees allowed for the delineation of 7 partially overlapping clusters. Although in recent yr. the subareas in psychology are less clearly distinguishable, definite shifts in focusing were notable and were introduced through selective hiring of staff members. During the earlier yr.

changes in orientation of the department paralleled those during the life-span of individual staff members. *Journal abstract.*

PROFESSIONAL DEVELOPMENTS

3984. ———. **Racism and prejudice.** *Journal of Religion & Health*, 1970(Oct), Vol. 9(4), 331-370.—Presents a summary of the remarks made by moderators and panelists, with some of the questions and comments offered by participants, in the discussion sessions of the 1970 joint conference held by the Academy of Religion and Mental Health and the Metropolitan Applied Research Center, in New York. The theme of the conference was "The collaborative responsibility of religion, psychiatry, psychology, and education in dealing with racism and prejudice. Beyond the dilemma—What can we do next?"—*Journal summary.*

INTERNATIONAL PSYCHOLOGY

3985. **Ardila, Rubén.** (National U. Colombia, Bogotá) **Développement de la psychologie latino-américaine.** [The development of Latin-American psychology.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(6-8), 410-415.—Psychology in Latin-America is distinguished by its emphasis upon utility and its relationship with the fields of teaching and medicine. The majority of Latin-American psychologists are employed as clinicians, psychometrists, and educators. Transcultural studies, psychometric problems, e.g., the establishment of norms, and operant conditioning as a therapeutic technique are currently in vogue. 13 Latin-American countries have professional psychological associations and all but Chile publish at least 1 of the 42 journals currently in print. Lists of pioneer Latin-American psychologists and of the names and addresses of 23 of the journals are included. (19 ref.)—*R. E. Smith.*

3986. **Dawson, John L.** (U. Hong Kong) **Psychological research in Hong Kong.** *Australian Psychologist*, 1970(Mar), Vol. 5(1), 59-68.—Describes the facilities for psychological research and teaching at the University of Hong Kong, a multicultural, multilingual university setting. Funding for cross-cultural research, with an emphasis on biological and sociological effects on cognitive and perceptual variables, is anticipated.—*H. Roemmich.*

3987. **Keats, J. A.** (U. Newcastle, New South Wales, Australia) **The gap between theory and data.** *Australian Psychologist*, 1970(Nov), Vol. 5(3), 221-236. In this address at the Annual Conference of the Australian Psychological Society, an attempt was made to link theory to data. Rasch's model for test scores is cited as such an attempt. Other instances of attempts to integrate theory with data collection and analysis are cited also. Among important ones is Piaget's work. (32 ref.)—*H. Roemmich.*

3988. **Nixon, Mary.** (Monash U., Clayton, Victoria, Australia) **Principles and issues in present-day psychological practice.** *Australian Psychologist*, 1970(Nov), Vol. 5(3), 280-285. In this discussion, various sources from British, American, and Australian publications were used.—*H. Roemmich.*

3989. **Rump, E. E., McNicol, D., & Ryder, L.** (U. Adelaide, South Australia) **The need for postgraduate courses in applied psychology in South Australia.** *Australian Psychologist*, 1970(Nov), Vol. 5(3), 270-

277.—Surveys to estimate the need for professional psychology were conducted in July 1969 in cooperation with 2 Australian universities. Answers were sought to the current and prospective employment situation, the desire for professional qualification, and the desire for postgraduate training among psychology students. It is concluded that the surveys indicated a need for applied psychology courses in South Australia and a demand for graduates in psychology, especially clinical and educational.—*H. Roemmich.*

3990. **Tucker, J. D.** (153 E. Ekibin Rd., Brisbane, Queensland, Australia) **The Public Service Arbitrator's Determination of salaries for psychologists.** *Australian Psychologist*, 1970(Nov), Vol. 5(3), 237-242.—Discussed significant features of the Determination to raise salaries of psychologists in the Commonwealth Public Service in Australia, handed down by the Commonwealth Public Arbitrator, July 1967. The Determination 155 of 1967 was considered a landmark in the history of applied psychology in Australia. Of special interest to psychology was the conclusion that, although services of psychologists were subjected to searching examination, the image of psychologists did not suffer by comparison with other professional groups.—*H. Roemmich.*

GENERAL BOOKS & REFERENCE WORKS

METHODOLOGY & RESEARCH TECHNOLOGY

3991. **Arató, Ottó.** (Budapest Educational & Sports Inst., Hungary) **A sportpszichológiai kutatások módszertanának fejlődése a Szovjetunióban.** [Methodological developments in Soviet sports psychology.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 305-318.—During the 1st decades research in Soviet sports psychology contented itself with studying physiological problems, with latency phase, RT, physical exercise within the factory, and analysis and training of vestibular functions. After World War II, sports psychology became a specialized branch of general psychology employing specifically adapted methods taken over from other branches. In its choice of subjects and goals it endeavors to satisfy the practical requirements of qualitative competition in sports. (Russian summary) (2½ p. ref.)—*English abstract.*

3992. **Büchler, Robert.** **A sportpszichológia néhány módszertani elvéről.** [On some methodological principles in sports psychology.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 301-304.—Discusses the evaluation of the theoretical basis of research and diagnostic methods applicable in sports psychology. By analyzing the methods of theoretical and applied sciences and by confronting them with each other, those which appear relevant to this branch of psychology are emphasized. (Russian summary)—*English summary.*

3993. **de Groot, A. D.** **Minimale methodologie: Zonder epistemologie.** [Minimal methodology: Without epistemology.] *Nederlandsche Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Dec), Vol. 25(11), 692. It is concluded that a minimal and normative methodology can be constructed and maintained without epistemology. Caution is expressed that the minimal and normative methodology can be corrupted by irrational and political pressures. Likewise, democracy can dis-

appear in a society that emphasizes the differences instead of the consensus among the constituency in the study of issues.—A. J. Ter Keurst.

3994. de Wit, H. F. (677 van Nijenrodeweg, Amsterdam, Netherlands) **Methodologie zonder epistemologie? Antwoord aan A. D. de Groot.** [Methodology without epistemology? Answer to A. D. de Groot.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Dec), Vol. 25(11), 690-691.—Discusses whether or not methodology requires the use of epistemology. As the criterion of the validity of empirical knowledge is explicit, it is difficult to determine the complete value of a methodology of an ongoing activity. Although the criteria of explicit knowledge are expressible, the "absolute validity" of implicit knowledge cannot always be objectively expressed. Consequently, it is impossible for one to identify all the contingencies, including psychological reactions, in an ongoing activity. With respect to the relevance of epistemology to methodology, it is concluded that when a system of action does not rest on a definitive methodology, it is unimportant to be concerned about epistemology. According to H. Feigl, "there are no philosophical postulates of science, i.e., that the scientific method can be explicated and justified without metaphysical presuppositions about the order or structure of nature."—A. J. Ter Keurst.

3995. Emley, G. S., Hutchinson, R. R., Hallin, E. R., & Kiraley, S. (Fl. Custer State Home, Augusta, Mich.) **A convenient method for physical storage of cumulative records.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 248.

3996. Garai, László. (Hungarian Academy of Sciences, Philosophy Inst., Budapest) **A személyiség-pszichológia önállóságáról.** [On the independence of personality psychology.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 103-108.—Discusses the crises in general and personality psychology which were precipitated by limitations of the intuitive method. Behaviorism is considered to be a way out of the crisis for general psychology, as psychoanalysis is for personality psychology in regard to objective methods. To avoid a theoretical crisis, however, it is suggested that general psychology switch from investigating stimulus-response behavior to objective actions, while personality psychology will have to stress interpersonal relations. It is noted that general and personality psychology are in parallel development and must eventually reach a synthesis. (Russian summary)—English summary.

3997. Kardos, Lajos. (Eötvös Loránd U., Budapest, Hungary) **A pszichológiában alkalmazott kutatási módszerek elvi kérdésel.** [Basic principles of some research methods in psychology.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 7-28.—Discusses the methodological crisis in psychology, analyzing the causes and epistemological history which reveal the inaccuracy of conceptions which have attempted to solve the crises by redefining psychology. The difference between the characteristics of psychological experimentation and those of other sciences/psychological is distinguished, noting the contributions of the cybernetic approach in regard to methods and theory. The influence of this approach on the neurophysiological foundations of psychology is discussed. (Russian summary)—English summary.

3998. Nordbeck, Bertil & Maini, S. M. (Lund U., Psychological Lab., Sweden) **Psychology of the re-**

searcher and research: Project Progress Report: I. Critical moments and processes in research work. *Psychological Research Bulletin, Lund U.*, 1970, Vol. 10(11), 29 p.—Presents a progress report which considers some principal aspects of the individual research process. A summary of the theoretical background, objectives, and results regarding studies of critical moments in research work, primarily among young researchers in the natural and social sciences is included. Specially described are critical moments and processes related to (a) initiation of and changes in the course of research, and (b) the emergence of new research ideas. (58 ref.)—Journal abstract.

3999. Nordbeck, Bertil & Maini, S. M. (Lund U., Psychological Lab., Sweden) **Psychology of the researcher and research: Project progress report: II. Studies in the selection of potential researchers.** *Psychological Research Bulletin, Lund U.*, 1970, Vol. 10(12), 15 p.—Presents the 2nd of 2 progress reports by B. Nordbeck and S. M. Maini in the field of "psychology of the researcher and research." The process of selection of potential researchers from among students at a university and an institute of technology in Sweden is considered. 6 exploratory studies are described. Results indicate that among the most important factors (based on differences between potential researchers and other students) in the process of selection are: (a) motivation for research training and postgraduate studies, (b) job at the department, (c) sex, (d) parental education, (e) the degree of personal involvement in different problems, (f) encouragement from the staff at the department, and (g) certain ability variables related to creativity.—Journal abstract.

4000. Salamon, Jenő. (Eötvös Loránd U., Budapest, Hungary) **A pszichológia módszertanának fejlődése a Szovjetunióban.** [Developments in psychological methodology in the Soviet Union.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 29-44. Presents methods of psychological investigation in the Soviet Union following the socialist revolution. Experiences gathered by Soviet psychologists over 50 yr. show that the detachment of psychology from philosophy has not yet been fully accomplished. Questions of attitude and theory have continued to exercise a significant influence over the development of methodology and educational methods. Success in Soviet psychology is considered to be due to the fact that it is based on dialectical and historical materialism and is being applied to building socialism. Developments over the last 50 yr. have been due to changes in attitude, methodology, and achievements. (Russian summary) (19 ref.)—English abstract.

4001. Surányi, Gábor. (Lajos Kossuth U., Debrecen, Hungary) **A kutatási és vizsgálati eljárások értékeléséről.** [Evaluation of research procedures.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 199-204.

Asserts that any methodology can be understood only from a relevant theory. Also considered are questions of how Soviet psychologists clarified their attitude toward the heritage of psychology. Research procedures for the exploration of individuality are considered, noting that standardized tests are very useful in psychological research. (Russian summary)—English summary.

4002. Thomas, Hoben. (Pennsylvania State U.) **Discrepancy hypotheses: Methodological and theoretical considerations.** *Psychological Review*, 1971(May), Vol. 78(3), 249-259. Utilizes the conceptual framework of C. Coomb's data theory to highlight similarities and

differences between 2 representative but different discrepancy hypotheses: D. McClelland and R. Clark's hypothesis and W. Dember and R. Earl's (see PA, Vol. 32:5022) complexity discrepancy theory. It is concluded that mapping of data into the models cannot be done unambiguously unless assumptions are made concerning as yet unspecified parameter values and properties of data. 2 different research strategies are discussed. A 2-stage strategy with simplifying assumptions is suggested as a possible approach toward quantitative specification of model parameter values. (32 ref.)—*Journal abstract.*

MODELS & MATHEMATICAL MODELS

4003. Amosov, N. M. & Kasatkin, A. M. (Inst. of Cybernetics, Kiev, USSR) *Samoobuchayushchayasya model' dvigatel'nogo povedeniya*. [Self-teaching model of motor behavior.] *Problemy Bioniki*, 1968(Nov), No. 1, 10-18.—Describes a system which provides a model for some programs of information processing in the cerebral cortex of higher animals and man—programs connected with the organization of motor behavior. The research is seen as representing 1 of the stages in the process of working out a heuristic model for the mental functions. The system is developed in the form of a computer program and can handle the following hypothetical programs of the mind: (a) stepwise information processing; (b) stepwise construction of programs of movement; (c) interaction between sensory and logical programs of information processing; (c) the subjectivity of motor programs, i.e., connection of wishes (seen as "generalized undifferentiated action") with the signal-blocks of emotion and action; and (e) program for attending.—*I. D. London.*

4004. Antomonov, Yu. G. (Inst. of Cybernetics, Kiev, USSR) *K voprosu o veroyatnostnykh protsessakh modelirovaniya zakonomernostei sredy korkovymi analizatorami*. [On the probability processes of modeling environmental patterns by the cortical analyzers.] *Problemy Bioniki*, 1968(Nov), No. 1, 75-78.—Examines: (a) the learning processes of animals, using, by way of example, the elaboration of CRs; and (b) the learning processes involved in the recognition of environmental patterns by man. A simple mathematical interpretation of these processes is presented. 2 stages are distinguished in the learning process: (a) a stage in which old determinisms are destroyed, and (b) a stage in which new neuronal structures come into being. The "characteristic point of transition through maximal indeterminism" may be used as a measure of the lability of neuronal structures.—*I. D. London.*

4005. Asmayan, N. V. & Golitsyn, G. A. (1st Medical Inst., Moscow, USSR) *Dinamicheskie sily v regulyatsii povedeniya*. [Dynamic forces in the regulation of behavior.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 179-186.—Derives mathematical formulae for the "dynamic forces of inertia and inhibition," on the assumption that there are 2 types of psychological forces directing behavior: (a) static forces which exist "without movement" (e.g., motivation), and (b) dynamic forces which appear "during the process of movement." An analysis of inhibition is undertaken, based on the established existence of inertial force in behavior, and

factors are disclosed which affect it: "diminution or cessation of reinforcement, antimotivation, [and] the presence of extraneous distracting activity." The results of confirmatory experiments are presented. (English summary)—*I. D. London.*

4006. Bugai, Yu. P. & Chernov, V. G. (Kharkov Inst. of Radioelectronics, USSR) *Model' podporogovykh yavlenii v vozbudimyykh élementakh*. [A model of subthreshold effects in excitable elements.] *Problemy Bioniki*, 1968(Nov), No. 1, 49-59.—Following an examination of the physiological premises for the construction of nerve elements, the functional design of a model is described along with the results of a study of transitory processes for different perturbations of input for the model. A system is produced of the parameters of the excitable elements necessary for a complete description of subthreshold processes, including those of accommodation and adaptation. Within the domain of subthreshold effects a wide class of important problems connected with the search for the optimal parameters of stimuli can be solved. The characteristics of excitable elements, determining their capacity to accommodate and adapt, are worked out. Another analytic form is procured for the "force-duration" law in physiology. The conditions of optimal excitation are described for linearly increasing input signals.—*I. D. London.*

4007. Bugai, Yu. P., Chernov, V. G., & Nefedov, Yu. I. (Kharkov Inst. of Radioelectronics, USSR) *Issledovanie podporogovykh yavlenii v vozbudimyykh élementakh na analogovoi modeli*. [Study of subthreshold effects in excitable elements in the analogue model.] *Problemy Bioniki*, 1968(Nov), No. 1, 39-48.—A model was constructed on the basis of a direct analysis of the transitory processes in subthreshold reactions in nerve and muscle tissues. A feature of the model is its suitability for only the description of effects arising on electrical stimulation through an internal microelectrode, since utilization of external electrodes, mono- and polysynaptic stimulation, requires the additional registration of new effects which in the present model are not contemplated and which should be the object of separate inquiry. However, in the case of natural mono-, polysynaptic, and antidromic stimulation and also with artificial stimulation using an external microelectrode, conditions are often met which are close to those of intraelectrode stimulation, thereby making the model suitable for the description of a wide class of effects under different conditions of excitation. The reactions of the system, utilized in the capacity of a model, to impulses of different forms are described. It is shown that, even when it comes to subthreshold effects, excitable elements which differ with regard to functional purpose may differ sharply in their ability to accommodate and adapt properties which essentially determine (a) the character of the consequent polarized and threshold reactions of these elements, and (b) their tendency primarily to the summing of de- or hyperpolarization for different frequencies when stimulation is rhythmically applied.—*I. D. London.*

4008. Dyubko, G. F. (Kharkov Inst. of Radioelectronics, USSR) *Matematicheskaya model' staticheskogo preobrazovaniya intensivnosti zvuka v gromkost'*. [Mathematical model of static transformation of intensity of sound into loudness.] *Problemy Bioniki*, 1968(Nov), No. 1, 72-74.—Examines loudness as a function of intensity. The mathematical model of transformation of intensity into loudness is developed,

and experimental data confirming this model are adduced. The formula which relates loudness to intensity is stepwise.—*I. D. London.*

4009. Hoepfl, Robert T. & Huber, George P. A study of self-explicated utility models. *Behavioral Science*, 1970(Sep), Vol. 15(5), 408-414.—Compared 2 types of utility models on the basis of their ability to predict Ss' evaluations of hypothetical university faculty members. Ss were 11 graduate students and 6 professors. The models obtained using multiple regression were better predictors than those obtained using a parameter-eliciting questionnaire, as expected, but the differences were small. An analysis of variance suggests that increasing the number of factors included in the descriptions caused Ss to be less able to make consistent evaluations even in the small range included in the study, and also suggests that Ss who were required to respond to fewer factors in early trials and more factors in later trials made less consistent evaluations overall than Ss who were required to respond to more factors in early trials and fewer factors in later trials. Data also suggest that Ss thought that the factors had a more uniform impact on the evaluations than was actually the case.—*Journal abstract.*

4010. Khachatur'yants, L. S., Antomonov, Yu. G., Kabikin, V. E., & Kotova, A. B. (Inst. of Cybernetics, Kiev, USSR) O kharakteristikakh dinamiki obucheniya. [On the characteristics of the dynamics of learning.] *Problemy Bioniki*, 1968(Nov), No. 1, 79-86.—Presents the results of a formal mathematical simulation of the dynamics of the learning process for the human operator. Preliminary data were supplied by experiments with secondary school students. An ongoing extrapolatory model of the learning process was constructed. The parameters of the learning curves were found for words of various lengths (2, 3, 5 letters) associated in a learning sequence with spatially separated light bulbs of various colors. Individual differences were noted.—*I. D. London.*

4011. Kushnarenko, Yu. P., Dyubko, G. F., Putyatin, E. P., & Bondarenko, M. F. (Kharkov Inst. of Radioelectronics, USSR) Modelirovanie statiki adaptatsii slukha i zreniya. [The modeling of the adaptational statics of hearing and seeing.] *Problemy Bioniki*, 1968(Nov), No. 1, 29-38.—Proposes a mathematical model for the adaptive transformation of signals in the auditory organ. The static reactions of this model are studied and compared with the data of psychophysical experiment. A formula is derived which can be verified also in visual experiments. This formula permits the construction of a similar model for the visual organ which agrees quite well with the experimental data.—*I. D. London.*

4012. McReynolds, Paul. (U. Nevada) Statues, clocks, and computers: On the history of models in psychology. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 715-716.—Traces the employment of models in psychological inquiry. The 1st models with psychological implications were dolls, effigies, and statues. Such "models" amount, in effect, to simpler replicas of the reality they reflect. The most notable example in psychology of the use of the statue as analogy is that of Condillac. The 1st sophisticated model in psychology was based on the mechanical clock. The complexity of "clockwork" developed in the 17 century, suggested that

man might usefully be conceptualized as a machine. Among the theorists who used clock models were Hobbes, Descartes, and LaMettrie.—*Author abstract.*

4013. Norman, M. Frank. (U. Pennsylvania) Slow learning with small drift in two-absorbing-barrier models. *Journal of Mathematical Psychology*, 1971(Feb), Vol. 8(1), 1-21.—Certain 2-choice learning models have the property that both the 1st and 2nd moments of increments Δp_i in A_i response probability p_i are of the order of magnitude of a parameter τ . It is shown that the distribution of p_i can be approximated by that of X_i , where X_i is a Markov process that is continuous in space and time.—*Journal abstract.*

[On the construction of a mathematical model of human vision involving color adaptation.] *Problemy Bioniki*, 1968(Nov), No. 1, 107-113.—Presents experimental data on bright color adaptation, using Maxwell's color disk with 2 comparative fields. 2 possible mathematical models involving color adaptation are constructed.—*I. D. London.*

4015. Shabanov-Kushnarenko, Yu. P. (Kharkov Inst. of Radioelectronics, USSR) O zadache matematicheskogo modelirovaniya zreniya cheloveka. [On the task of developing a mathematical model of human vision.] *Problemy Bioniki*, 1968(Nov), No. 1, 19-28.—Examines the "method of the black box" in relation to research on human vision. The task of constructing a full-fledged synthetic eye, capable of picking up and processing information, is developed in the form of a computer program. It is in connection with this that the incoming and outgoing signals of the visual organ are described in terms useful for the contemplated program.—*I. D. London.*

4016. Shabanov-Kushnarenko, Yu. P., Dyubko, G. F., & Putyatin, E. P. (Kharkov Inst. of Radioelectronics, USSR) Modelirovanie dinamiki adaptatsii zreniya i slukha. [Modeling the dynamics of visual and auditory adaptation.] *Problemy Bioniki*, 1968(Nov), No. 1, 97-106.—Develops the consequences of a mathematical model for the dynamics of visual adaptation. Experimental data on visual and auditory adaptation are cited which confirm the validity of deduced formulae.—*I. D. London.*

4017. Smolicz, J. J. (U. Adelaide, South Australia) Paradigms and models: A comparison of intellectual frameworks in natural sciences and sociology. *Australian & New Zealand Journal of Sociology*, 1970(Oct), Vol. 6(2), 100-119. Compared conceptual models in natural sciences and sociology with special reference to their relative power to direct and coordinate research and their capacity to gain acceptance and command allegiance among the active practitioners of the subject. The comparison reveals that models or "paradigms" found in mature natural sciences are a different order of theoretical species from those present in sociology. An analogy is drawn between the conceptual schemes of early, preparadigm science and current sociological models, with some speculation about the eventual development of sociological paradigms.—*Journal summary.*

4018. Umryukhin, E. A. (All-Union Research Inst. of Medical Instrumentation, Moscow, USSR) Ierarkhiya

rezul'tatov kak osnova mnogourovnevnoi funktsional'noi sistemy. [Hierarchy of results as basis for a multilevel functional system.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 211-219.—Proposes a mathematical scheme for control in the living organism, simulating the relation between the results of consecutive behavioral acts and the final desired goal, as indicated in Anokhin's functional systems theory. The union of individual functional systems into a complex hierarchical functional system is seen as taking place by means of a coordinated isolation of parameters of intermediate outcomes in each of the subsystems in order to procure a final useful outcome in the larger system. Each subsystem, on the basis of the final outcome assigned to it, forms the "acceptor of action," into which arrive the parameters of intermediate outcomes assuring goal achievement. Simultaneously these intermediate outcomes create the stage on which the final useful effect of the subsystem at the following level is evaluated. (English summary)—*I. D. London.*

4019. Uteush, E. V. (Kharkov Inst. of Radioelectronics, USSR) **Modelirovanie biologicheskoi pamyati.** [Modeling biological memory.] *Problemy Bioniki*, 1968(Nov), No. 1, 60-66.—Analyzes and substantiates the approach to the mathematical modeling of biological memory as a cybernetic system. Demonstrates that the distribution of information within the scope of memory can be managed by 2 methods: (a) random search, and (b) determined dispatch of information from 1 level of memory to memory of older formation. A mathematical model is proposed and analyzed for the processes of committing a list of information to memory. Time for committing a standard communication to memory serves as a "generalized criterion" of these processes.—*I. D. London.*

MATHEMATICS & STATISTICS

4020. Bogartz, Richard S. (U. Illinois) **Last squares methods for locating function shifts and disturbance regions.** *Psychological Bulletin*, 1971(Apr), Vol. 75(4), 294-296.—Presents some generalizations of a least squares method previously introduced by R. S. Bogartz (see PA, Vol. 43:6103) to fit 2 intercepting lines to a set of data points. Polynomials of arbitrary order are considered instead of straight lines. The concept of a disturbance region is introduced. Methods are given for locating the disturbance region described by 1 polynomial in a portion of the range of the independent variable while another polynomial relates the dependent variable to the independent variable in the rest of the range of the independent variable. A decision rule for deciding the order of the polynomials under consideration, based on a sequence of F tests, is given.—*Journal abstract.*

4021. Ekman, Goesta & Kuennapas, Teodor. (U. Stockholm. Psychological Labs., Sweden) **Distribution function for similarity estimates.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 967-983.—Reports an investigation of the interindividual variation of similarity estimates. Data from a previous large-scale study by T. Kuennapas were used. Similarity estimates were available for 378 stimulus pairs judged by 57 Ss. The standard deviation was shown to vary regularly with the mean similarity estimate. A function derived from the binomial distribution function was found to describe the trend

highly satisfactorily. As a further illustration of the same principle, it was shown that the binomial function describes the frequency distributions of similarity estimates in close approximation. It is suggested that similar simple principles may describe the data obtained in experiments involving conventional unidimensional scaling techniques, e.g., magnitude and ratio estimation. (22 ref.)—*Journal abstract.*

4022. Falmagne, J. C. (National Foundation for Scientific Research, Brussels, Belgium) **The generalized Fechner problem and discrimination.** *Journal of Mathematical Psychology*, 1971(Feb), Vol. 8(1), 22-43.—Fechner's proposal of measuring sensation using discrimination thresholds has been criticized by a number of authors. It can be argued, however, that the historical connections between the experimental study of sensory thresholds and the problem of measuring sensations is fortuitous. In fact, Fechner's scheme of psychophysics can be generalized in a straightforward manner to arbitrary discrimination indices. This immediately raises interesting questions, e.g., what conditions must satisfy 2 discrimination indices to yield identical scales? These and related questions are investigated from a theoretical and experimental standpoint. The usual questions of existence, uniqueness, and construction of solutions to Fechner's problem are also discussed. (19 ref.)—*Journal abstract.*

4023. Gitter, A. George. (Boston U.) **Factor analytical approach to indexing multivariate data.** *CRC Report, Boston U.*, 1970(Aug), No. 43, 13 p.—Presents an approach for aggregating individual measures by factor analyzing a States \times Variables matrix to construct social indicators. Factor scores of selected factors are used as the state's indicators of major components of the indicator, while the weighted sum of these scores becomes the state's indicator. Procedures for deriving national indicators, and computing postbase year indicator values are discussed.—*Journal abstract.*

4024. Kleiter, Gernot. **Krise der Signifikanztests in der Psychologie.** [Crisis of the significance test in psychology.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1969, Vol. 17(1-2), 144-163.—Evaluates criticism concerning statistical bias in significance tests. Decisions concerning the choice of a test can distort or even falsify reliability. Every tested theory must be turned into a statistical hypothesis. Every assumption of normal distribution and of a null hypothesis could be rejected on the basis of the number of observations, as reliability of significance tests varies with the number of observations. On the contrary, meaningful differences in the population frequently escape identification within the sample in significance tests. Random significance may result from increased testing with the identical data. The application of subjective probability theory is recommended. Further differentiation of the scope of the hypothesis is also suggested as a corrective measure. (55 ref.)—*B. Stanton.*

4025. Livingston, Samuel A. **Some observations on the estimation of true scores.** *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*, 1970(Jun), No. 69, 10 p. Compared the procedure of estimating true scores by means of a transformation of the obtained score based on the reliability coefficient with the use of the obtained score without transformation. It was found that, using the mean squared error as a criterion, the transformed score is a better estimate for most examinees but poorer for those whose true

scores lie furthest from the mean. An example is provided.—*Journal abstract.*

4026. Macrae, A. W. (U. Birmingham, England) **On calculating unbiased information measures.** *Psychological Bulletin*, 1971(Apr), Vol. 75(4), 270-277.—Tested 6 ways of estimating information free from sampling bias, using Monte Carlo methods with a digital computer. 2 techniques had little to commend them, but (a) 2 published techniques were effective with appropriate distributions; (b) calculating bias by the A. G. Carlton (see PA, Vol. 43:7521) formula, with the sample taken as a model of the population probabilities, gave a good correction if the sample was large enough; and (c) estimating the population mean and standard deviation from the sample and using these to calculate population probabilities was effective even with small samples and with a wide variety of distributions, although it was slightly more restrictive in its assumptions than was technique b. A table is provided for hand calculation of technique b. A source for computer procedures for techniques b and c is reported.—*Journal abstract.*

4027. Natalicio, Luiz F. & Kidd, Ronald V. (U. Texas) **Experimental methodology and theory-building in mathematical psychology.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 43-54.—An inquiry is made into the directions that theory-building in psychology might be taking with respect to the new trend in experimental methodology generated by mathematical models, concept-learning studies, and studies in individual differences. The implications of nomological theories, informal theories, and modeling activities with respect to this trend are analyzed in general, and an integrative description is developed. Problems presented by the use of isomorphism as the implicit justification for this methodology are emphasized. Some basic issues in theory-building which seem in need of clarification are outlined. (26 ref.)—*Journal abstract.*

4028. Steingruber, H. J. (127 Himmelgeisterstr., Dusseldorf, W. Germany) **Indikation und psychologische Anwendung von verteilungsfreien Äquivalenten des Regressionskoeffizienten.** [Indications and psychological application of distribution-free equivalents of the regression coefficient.] *Psychologie und Praxis*, 1970(Oct), Vol. 14(4), 179-185.—Since textbooks of statistics usually do not give measures for interspecific association, 2 methods for this measurement are presented: Hellmich's 2×2 table K and Deuchler's measure D which is a binary distribution defined by a Pearson Bravais regression coefficient. Deuchler's work dates back to 1915. A practical example from the field of test construction is discussed. Both formulae are included.

R. F. Wagner.

4029. Zimmerman, Donald W. (Carleton U., Ottawa, Ontario, Canada) **Probability spaces and the theory of error of measurement.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 291-301.—Reports that a model of variability in measurement, which is sufficiently general for a variety of applications and which includes the main content of traditional theories of error of measurement and psychological tests, can be derived from the axioms of probability, without introducing "true values" and "errors." Beginning with probability spaces (Ω, P) and (Φ, P_2) , the set Ω representing the outcomes of a measurement procedure and the set Φ representing individuals or experimental objects, it is possible to construct suitable product probability spaces and collections of random variables which can yield all results

needed to describe random variability and reliability. An attempt is made to fill gaps in the mathematical derivations in many classical theories and at the same time to overcome limitations in the language of "true values" and "errors" by presenting explicit the essential constructions required for a general probability model.—*Journal abstract.*

Factor Analysis

4030. Stone, LeRoy A. & Coles, Gary J. (U. North Dakota) **Correlational similarity: The basis for a new revised method of similarity analysis.** *Statistica Psychologica*, 1970, Vol. 12(4), 258-265.—Proposes a revised method of similarity analysis based on the concept of correlational similarity and representing an improvement on the model proposed by G. Ekman. It is concluded that if judgmental factors are oppositional in bipolarity (as against situations where they are not), far more interpretational information relative to processes or strategies of judgment are obtained. (Czech & Russian summaries) (25 ref.)—*Journal abstract.*

COMPUTERS & PROGRAMING

4031. Allison, Roy J. & Hurst, Charles M. (U. Texas, Arlington) **Behavioral sciences data punch system.** *USAF ARL Technical Report*, 1969(Dec), No. 69-19, 13 p.—Presents an expeditious technique for establishing a computer-coordinated comprehensive performance data recording and analysis system, employing solid state circuitry. Circuit descriptions and schematics basic to operations of the data punch system are described.—*USAF ARL.*

4032. Amosov, N. M. & Talov, S. A. (Inst. of Cybernetics, Kiev, USSR) **Planirovanie povedeniya na osnove vosprinyatiya informatsii.** [Planning behavior on the basis of detected information.] *Psichologiya*, 1968(Nov), No. 1, 3-9.—Examined the problems involved in the creation of an artificial intellect. The cardinal principles of information processing by the human brain, hypothesized from the data of physiology and psychology, were utilized in finding solutions. The model, constructed on the basis of these principles, is shown to be capable of (a) detecting what is acting on it; (b) extracting information therefrom; and (c) displaying its behavior in correspondence with the task of maintaining certain parameters of its state within a given range of values. The proposed system is developed in the form of a computer program.—*I. D. London.*

4033. Brown, Bill R. & Evans, Selby H. (Texas Christian U., Fort Worth) **Further applications of the Random Adaptive Module (RAM) system to schema theory.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Mar), No. 4-70, 34 p.—Describes the further development and application of N. H. Evans' (see PA Vol. 43:2223) model for schema concept formation. A computer simulation of the model extended it to include higher order pattern representation and ways used to make quantitative predictions of human performance in 2 mixed selection discrimination tasks. The simulations with 81 and 12 noise values indicated that schema is predicted both the gross and detailed characteristics of human schema concept formation. Results support the hypothesis that the Random Adaptive Module's basic components may be useful in constructing models for

performance in a variety of tasks related to schema theory. (21 ref.)—*Journal abstract.*

4034. Johnson, Edgar M. **An analysis of variance FORTRAN IV program for small disk-supported computers.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Dec), No. 31-70, 41 p.—Developed an analysis of variance program for small disk-supported computers on an IBM 1130, 8K core and 1-disk drive. This program will accept balanced analyses containing as many as 8 factors in any combination of within- and between-S effects. The number of levels of any factor is restricted only by the number of data points. On an 8K, IBM 1130, the program will accept 2050 floating-point or 4100 integer data points. Instructions for users, a FORTRAN IV listing, and sample problems are included. The program is easily adapted to any FORTRAN IV system with disk storage and at least 8K core.—*Journal abstract.*

4035. Kerr, Joyce, et al. (U. Pittsburgh, Medical School) **A PDP-12 system for on-line acquisition of heart rate data.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 87-88.—Describes a research program for investigating the responsiveness of infants at high risk for developing schizophrenia. 2 measures of reactivity to brief auditory stimuli, the evoked heart-rate response and the evoked potential of the brain, are recorded for analysis by the PDP-12 computer. An interface to the PDP-12, called the R peak detector and R-R interval counter, is used for reducing the EKG to R-R intervals, with an accuracy of ± 1 msec. The current usage of the PDP-12 and its IBM-compatible tape transports is discussed, and proposed developments for on-line statistical analyses of the physiological data and real-time control of the experiment are presented.—*Journal abstract.*

4036. Krause, Merton S. (Inst. for Juvenile Research, Chicago, Ill.) **Corroborative results and subsequent research commitments.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 219-227.—Programmatic research based upon well-formulated theories can be optimally planned (and sequenced) when the present expected value of corroborative results from the several experiments possible are compared. This value depends on, at least, the probativeness and informativeness of the specific theorems tested by each experiment and the reliability and residual range of the theories containing these theorems. How these 4 variables are defined and may be used to calculate values for assigning tests priorities are described.—*Author abstract.*

4037. Uteush, E. V. (Kharkov Inst. of Radio-electronics, USSR) **O pamyati kiberneticheskikh sistem.** [On the memory of cybernetic systems.] *Problemy Bioniki*, 1968(Nov), No. 1, 67-71.—Proposes a model of memory which is (a) characterized by hierarchy of structure and multiplicity of levels of memory, and (b) structured as a "branching tree of switches."—*I. D. London.*

TESTING

4038. Besure, J. (Royal Military Academy of Belgium, Brussels) **Quelques considerations à propos du test de structuration graphique (T.S.G.).** [Some considerations apropos of the Graphic Structures Test (TSG).] *Information Psychologique*, 1970(Jan), Vol. 10(37-38), 85-104.—Describes an adaptation of the Kohs' Block-Design Test with data on the relationship

between the items obtained through a factor analysis, and on the internal consistency of the test.—S. G. Vandenberg.

4039. Crehan, Kevin D. & Slakter, Malcom J. (State U. New York, Buffalo) **Note on comparison of paired-multiple-response items and multiple-choice items.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 310.—Notes 3 deficiencies of a paired-multiple-response test format suggested by E. A. Namy (see PA, Vol. 44:5707): (a) diagnostic information is lost on both examinees and test items, (b) there is an uncertain effect on the concept of true score, and (c) the claim of increased variability and reliability is questionable.—*Author abstract.*

4040. Seibert, Warren F. (U. Michigan) **The motion picture as a psychological testing medium: A look at cine-psychometrics.** *Viewpoints*, 1970(Sep), Vol. 46(5), 91-102.—Refers to the work of J. J. Gibson who directed the Air Corps' Psychological Test Film Unit during World War II. The motion picture tests were designed for use in the selection of military air crewmen. Research on cine-psychometry has been dormant. At this time, its potential for use with special populations—the educationally deprived, the hard of hearing, and the young —is being stressed. Short-term memory tests, successive perception tests, and sequential word tests have been developed. Test administration reliability, situation simulation, and the substitution of image, or action for language offer very practical motivations for use of this technique. (16 ref.)—*I. Linnick.*

4041. Whitely, Susan E. (U. Minnesota) **Domain referenced testing: An alternative model for test construction.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 515-516.—Domain-referenced testing, interpreting scores with direct reference to the domain of item content, has been given increasing attention in recent years. Neither the programmed learning approach nor the achievement test approach has been able to provide models that can handle complex and heterogeneous domains to allow a domain-referenced score interpretation. A modified version of Stephenson's structured Q-sample model is presented to provide an alternative method of test construction. It is different from current approaches because it provides information concerning domain structure and does not depend upon random sampling to estimate true score.—*Author abstract.*

Construction & Validation

4042. Bradley, M. (Public Service Commission of Canada, Ottawa, Ontario) **Statistical comparison of the Otis Self-Administering Tests of Mental Ability and PSC Examinations 302A and 5A (GIT series).** *Studies in Personnel Psychology*, 1970(Apr), Vol. 2(1), 74-80.—The total raw and weighted scores of the General Intelligence Test (used by the Public Service Commission of Canada) and Otis Tests were correlated for 486 males and 316 females, aged 17-63, in 4 categories: secondary school level English-speaking, secondary school level French-speaking, university level English-speaking, and university level French-speaking. Results were statistically significant well beyond the .001 level for all comparisons. Correlation coefficients ranged from +.620 to +.742. Construct validity among intelligence tests is discussed. (French abstract)—*J. G. Tiedemann.*

EXPERIMENTATION & OBSERVATION

4043. Berkowitz, Leonard. (U. Wisconsin) **Reporting an experiment: A case study in leveling, sharpening, and assimilation.** *Journal of Experimental Social Psychology*, 1971(Mar), Vol. 7(2), 237-243.—A survey of a number of social psychology books reveals glaring errors in the reporting of the findings in the now classic experiment by S. Schachter (see PA, Vol. 25:8043) on deviation and rejection. Authors all too frequently have (a) assimilated and sharpened their summaries of this study to a general theme, (b) omitted important details inconsistent with their theme, and (c) misrepresented the results in important ways. It is concluded that the tendency to reject opinion deviates may not be as strong as is commonly supposed in social psychology texts and clearly is a far more complicated phenomenon than social psychologists typically indicate to their readers and students. (21 ref.)—*Journal abstract.*

4044. Johnston, James M. (U. Florida) **A universal behavior graph paper.** *Journal of Applied Behavior Analysis*, 1970(Win), Vol. 3(4), 271-272.

4045. Landers, Daniel M. (U. Illinois, Children's Research Center, Champaign-Urbana) **Effect of the number of categories systematically observed on individual and group performance ratings.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 731-735.—Determines the effect of the number of behavior categories systematically observed on the reliability and accuracy of judges' ratings. 24 Ss representing 2 gymnastic judging systems rated 24 filmed routines under standardized conditions. Results show that the judges rating only 1 category had significantly less variance from absolute ratings, less intravariance about their own mean, and higher reliability than those rating 3 categories. When the individual judge's ratings were combined into group ratings, no significant differences were found between observation systems on variance from absolute ratings; however, the groups rating only 1 category had significantly less intravariance than groups rating more than 1.—*Journal abstract.*

4046. Mac Rae, Kenneth D. (Queen's U., Belfast, Ireland) **Serial position and sequential dependencies in repeated measures designs.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 736-738.—Presents a scheme for the evaluation of the effects of serial position and sequential dependencies in experiments where repeated measures are made on the same Ss, and where it is possible for S to receive any of these treatments more than once. The desirability of examining such effects is discussed, and it is concluded that, where the experimental situation permits, repeated measure plans of the type presented here should be used both because serial-position effects and sequential dependencies are of interest in their own right and because the additional cost in E time is often small.—*Journal abstract.*

APPARATUS

4047. Davidson, Arnold B., Davis, Dixon J., & Cook, Leonard. (Smith Kline & French Lab., Philadelphia, Pa.) **A rapid automatic technique for generating operant key-press behavior in rats.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 123-127.

Trained experimentally naive Sprague-Dawley rats to key press on a fixed-ratio 10 schedule of food reinforcement by a completely automatic procedure within a

single, 1-hr session. Control procedures demonstrated that the resulting behavior was an operant, under control of the schedule of reinforcement and the specified reinforcing stimulus (food). A simple, combination food-tray operandum, also described, was used as the basis for the training technique.—*Journal abstract.*

4048. Findley, J. D., Robinson, W. W., & Gilliam, W. (Johns Hopkins U., Medical School) **A restraint system for chronic study of the baboon.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 69-71.

4052. Thompson, R. D., & Grant, C. V. (U. S. Bureau of Sport Fisheries & Wildlife, Denver, Colo.) **Automated preference testing apparatus for rating palatability of foods.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 215-220.—Describes an electronic preference testing apparatus for measuring taste preference of rodents and other small animals with solid or liquid foods. The apparatus is designed on the principle of the 2-choice preference technique. It operates photoelectrically with a sequence of presentations so that whenever an S eats from a compartmentalized food tray, a standard and a test food are each briefly sampled alone before both foods are presented together (in alternate positions) for preference determination. Preferences are automatically recorded on digital counters. The apparatus is built in 2 modules (a preference tester and the master control) connected by multiconductor cable. The modular design provides portability and isolation of the Ss from the major noise producing components. Diagrams of the apparatus are given, and test results from a trial that evaluated positional bias and a sucrose concentration preference experiment are presented to demonstrate its application in research.—*Journal abstract.*

EXPERIMENTAL PSYCHOLOGY

4053. Farrell, B. A. **On the design of a conscious device.** *Mind: A Quarterly Review of Psychology & Philosophy*, 1970(Feb), Vol. 79(315), 321-346.—Describes the design of a conscious device, i.e., a device whose reactivity is such that upon examination the difference between the device and a human being in regard to seeing, hearing, and feeling cannot be determined. The main steps required for construction are outlined by means of the model construction technique used by psychologists. The aspects of conscious functioning which result in seeing and hearing are emphasized. Objections which may be raised as to the validity of using the model technique and whether a complete device would be "conscious" are discussed.—S. Knapp

4054. **Vaught, Glen M.** (State University Coll. New York, Oswego) **Autokinetic word writing as a function of variations in instructions.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 743-746.—Attempted to determine whether or not variation in autokinetic word writing (AWT) instructions would increase word production. Normative characteristics of word productions of 45 male and 54 female undergraduates are presented. It is generally concluded that, while increased word production does result from different instructions, the reliability of this response measure remains questionable.—*Journal abstract.*

PERCEPTION

4055. **Bartley, S. Howard.** (Michigan State U., Lab. for the Study of Vision & Related Sensory Processes) **Some misconceptions concerning perception.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Apr), Vol. 47(4), 259-266.—Discusses perception as an overall immediate response to stimulation of sense organs, the reaction that expresses the organism's relation to the environment regardless of whether this expression is conscious or simply a gesture or other motor act that is discriminative. This conception of perception differs from that sometimes held. The historical basis for misconceptions of perception is discussed, the basis for the present concept is described, and some optometric applications are noted.—*Journal abstract.*

4056. **Colston, Malcolm A.** (U. Queensland, Brisbane, Australia) **A note on adaptation level theory.** *Australian Psychologist*, 1970(Mar), Vol. 5(1), 49-51.—Describes a formula for predicting adaptation level. 175 males served as Ss whose task was judging a series of weights. Ss assumed the weights to be of individuals of their same age and sex. In the formula, the weights were given twice the weighting of the Ss' own weights. A satisfactory prediction of adaptation level is reported.—*H. Roemmich.*

4057. **Cratty, Bryant J. & Duffy, Kirt E.** (U. California, Los Angeles) **Studies of movement aftereffects.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 843-860.—213 Ss participated in 4 experiments designed to identify relationships between figural aftereffects elicited by hand, limb, and total body movements. The measures obtained were reliable and highly task specific. (36 ref.)—*Journal abstract.*

4058. **Forrest, Elliott B.** (Optometric Center of New York City, N.Y.) **Perception and human communication.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Aug), Vol. 47(8), 640-643.—The term, perception, means different things to different investigators. Some differences are fundamental to the definition while others are a matter of semantics. Confusion tends to be minimized if the act of perception is related to the act of human communication. Perception is presented in terms of the organism as both a "source" and a "receiver" of information not only to and from others in the external environment but to and from itself as well.—*Journal abstract.*

4059. **Over, Ray.** (U. Queensland, Brisbane, Australia) **Comparison of normalization theory and neural enhancement explanation of negative aftereffects.** *Psychological Bulletin*, 1971(Apr), Vol. 75(4), 225-243.—Proposes that neural inhibitory interaction underlies negative aftereffects as well as figural after-

effects, with the former occurring when nontopographic principles are used by the nervous system to signal stimulus values and the latter when topographic coding is involved. Relationships between aftereffect data and information available about feature analysis from electrophysiological measurement and contour masking studies are examined with emphasis on tilt and movement aftereffects. It is concluded that even though the neural enhancement position cannot be tested in detail until more is known about tuning characteristics in sensory systems and the way cells respond to abrupt changes in stimulus value, in its present form it offers a more satisfactory explanation of negative aftereffects than normalization theory. There is little to support the latter claim that negative aftereffects occur as by-products of a perceptual adaptation process. (3 p. ref.)—*Journal abstract.*

4060. **Praetorius, Nini.** (Copenhagen U., Denmark) **Nogle vaesentlige problemer omkring det perceptionspsykologiske stimulusbegreb.** [Some essential problems concerning the concept of stimulus in the psychology of perception.] *Nordisk Psykologi*, 1969, Vol. 21(5), 301-319.—For a long time psychologists, philosophers, and physiologists alike have been aware of the problems and inadequacies that follow from adopting a dualistic causal view as a basis in the theories and models of perception psychology. Despite this realization, any better alternatives have apparently not readily suggested themselves. An attempt is made to indicate the kind of difficulties and inconsistencies encountered in dualistic perception theories and concepts because of the unfortunate confusion of 2 causal theories, 1 philosophical (epistemological), the other physiological, by presenting, among other things, an analysis of Gibson's perception model. A possible alternative is suggested in replacement of the traditional dualistic causal description of the experiments and laws of perception psychology.—*English summary.*

4061. **Taylor, M. M.** (Defence Research Establishment, Toronto, Ontario, Canada) **On the efficiency of psychophysical measurement.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 505-508.—A previously proposed upper bound on the performance of psychophysical techniques that attempt to determine points on psychometric functions is shown to be a least upper bound. The existence of a realizable technique (the Robbins-Monro process) which asymptotically attains the performance of the proposed ideal shows that this ideal provides an appropriate basis from which to calculate the absolute as opposed to relative efficiency of real psychophysical measurement techniques. The concept of incremental efficiency is introduced. It is shown to be useful in analyzing the performance of measurement techniques when the initial uncertainty of the estimate, often ignored in simulation studies, is neither infinite nor 0. and to permit independent assessment of the efficiency of separate portions of a measurement process.—*Journal abstract.*

Illusion

4062. **Beh, Helen C., Wenderoth, Peter M., & Purcell, A. T.** (U. Sydney, New South Wales, Australia) **The angular function of a rod-and-frame illusion.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 353-355.—Predicted that vertical settings of a rod surrounded by a square frame would be in error in the direction of the

frame axis closest to true vertical as the frame varied in tilt. Results of an experiment with 4 male and 16 female undergraduates were in accord with this hypothesis.—*Journal abstract.*

4063. duMas, Frank M. & duMas, Michael E. (Augusta Coll.) **The projected brain illusion.** *Journal of Psychology*, 1971(May), Vol. 78(1), 115-118.—Stimulus conditions for projected brain illusion (PBI) are to stare above and beyond the top of a candle flame in a dark void. The illusory response is to see "out there" an image closely resembling outline drawings of the brain, i.e., as though one is seeing one's own brain projected into space. Physical rather than geometric optical magnification of the internal structure of the eye seems to offer the best explanation of PBI.—*Author abstract.*

4064. Horrell, R. I. (U. Hull, England) **Retinal image or perceived features as determinants of error in geometric illusions?** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 97-106.—An examination of the implications of the theory of geometric illusions proposed by R. L. Gregory leads to the prediction that the illusion error should be determined by the retinal image projected by the figure rather than by its perceived characteristics where these differ. This prediction was tested in 2 experiments, using a version of the Zöllner illusion. In Exp. I, with 12 students, distance was used to manipulate the retinal image characteristics; in Exp. II, with 12 students, slant was used. In both cases, error followed changes in the retinal image rather than being held relatively constant by the perceived size and shape. It is suggested that the effect of slant and distance on illusions, as reported by others, can be attributed to the change in retinal image characteristics involved in such operations.—*Journal abstract.*

4065. Simondon, G. **La perception de longue durée: III. Analyse de la rotation de volumes vus en projection.** [Perception of long duration: III. Analysis of volumes of rotation seen in projection.] *Journal de Psychologie Normale et Pathologique*, 1970(Oct), No. 4, 403-422.—The experiment involved different categories of projections of shadows produced by an animated object the revolving motion of which occurred around a vertical axis. Results were that for a solid opaque geometric, the determining influence of external limits and irregularities, or unusual points of the surface, indicated different phases of prolonged perception. Concerning transparent objects or those finely delineated, texture governed the variety of effects.—*L. A. Ostlund.*

Time

4066. Haber, Ralph N. & Standing, Lionel G. (U. Rochester) **Direct estimates of the apparent duration of a flash.** *Canadian Journal of Psychology*, 1970(Aug), Vol. 24(4), 216-229. Substantial evidence now shows that visual persistence can extend the apparent duration of a brief stimulus flash by several hundred msec. A technique of G. Sperling's was applied in which S adjusts a click to coincide, 1st with the apparent onset of a flash, and then with its apparent offset. The interclick interval thus determined is used as a measure of the apparent duration of the flash. Visual persistence is shown when the interclick interval exceeds the actual stimulus duration. When the flash and adapting field luminances were the same, persistence reached 175 msec for brief flashes (10 msec.), decreased to 60 for longer ones (200

msec.), and was negligible for flashes exceeding 500 msec. When a visual noise field followed the post-adaptation field, persistence was determined entirely by the time from the flash offset to noise onset, up to about 200 msec. Beyond that, the noise onset had no effect, presumably because the persistence had already ceased before the noise arrived. Conditions without visual noise, but with different combinations of pre- or postadaptation field, also produced substantial changes in visual persistence. Results show that (a) visual persistence can be estimated rather directly by this technique; (b) persistence is sensitive to adaptation conditions; and (c) visual noise will terminate persistence. Results support a process-stopping interpretation of information processing by visuolysis, as distinct from a sensory integration view. (French summary) (16 ref.) *Journal abstract.*

4067. Lindauer, Martin S. (State University Coll. New York, Brockport) **Duration of time in time-related words.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 775-781.—Assigned 275 time-related words, considered a source for the cognitive investigation of time perspective, to 10 time intervals ranging from sec. to millennia by 32 undergraduates equally divided by sex. Differences were found in the duration of time connoted by the verbal materials, with reference to the frequency with which the 10 time intervals were used, as well as the time spans associated with the past, present, and future. No sex difference was noted. (45 ref.)—*Journal abstract.*

4068. Toman, Walter. (Psychological Inst., Erlangen, W. Germany) **Zellerleben und Motivationsabläufe.** [Time experience and processes of motivation.] *Psychologische Rundschau*, 1971(Jan), Vol. 22(1), 38-42. People perceive the same time span differently depending upon their motivational state. A motivation model developed by the author is examined with respect to its usefulness as an indicator of time experience.—*W. J. Koppitz.*

VISION

4069. Ball, Richard J. & Bartley, S. Howard. (Michigan State U.) **Effects of intermittent monochromatic illumination on visual acuity.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Jul), Vol. 47(7), S19-S28. Reports research concerning the effects of selected bands of monochromatic intermittent illumination on the task of visual acuity. Wavelength bands centered at 500 nanometers (nm.) (496-505 nm. at 10% transmission level) 580 nm. (576-584 nm.), and 640 nm. (637-644 nm.) were presented intermittently at 1, 5, 10, and 15 cps as well as with steady illumination. All intermittency conditions were with a 1/2 pulse-to-cycle fraction. A marked decrement in visual acuity performance was found for those wavelength-temporal combinations that previously were found to produce brightness enhancement, desaturation, and hue shifts. Greatest decrement was found for the 500-nm. waveband at an intermittency rate of 5 cps. Discussion includes relating the study to previous research and its relation to basic neurophysiological vision processing. (16 ref.) *Journal abstract.*

4070. Crossmann, Edward R., Goodale, Peter J., & Marg, Elwin. (U. California, Berkeley) **A computer-based automatic method for determining visual acuity.** *American Journal of Optometry & Archives of Optometry*, 1970(May), Vol. 47(5), 344-355. Describes a computer-based automatic meth-

od for clinical visual acuity determinations. The procedure employs the staircase method of threshold determination using Landolt C's, and was tested on 14 Ss representative of normal optometry clinic patients. Though more precise due to small step size, results show fair agreement with manual determinations performed at the same time using an American Optical Company Snellen chart. The automatic method required more time because (a) Ss used 4 instead of 26 response alternatives, and (b) a mean step size of 1.15:1 instead of 1.5 or 2:1 was used. While most series of repeated automatic determinations were stable, a few Ss showed improvement or deterioration apparently due to practice or fatigue. Economic aspects of computer assistance for optometric examinations are briefly discussed and the potential value of time-sharing and remote operation is noted.—*Journal abstract.*

4071. Dick, A. O. (U. Rochester) **Visual processing and the use of redundant information in tachistoscopic recognition.** *Canadian Journal of Psychology*, 1970(Jun), Vol. 24(3), 133-141.—Examined the relation between information available in the stimulus and information required in report. 54 undergraduates in 3 groups reported on the basis of different attributes of 4 sets of visual stimuli varying in form of redundancy. Loss of information from conic memory was measured by means of a partial report procedure. The redundancy manipulation affected the level of accuracy and there was differential loss of stimulus information from iconic memory, depending on the stimulus attribute to be reported. There was, however, no relation between redundancy and loss of information. Results show that (a) the use of stimulus information plays an important role in accuracy, and (b) there are some basic differences in the way in which the visual system treats different categories of information. (French summary)—*Journal abstract.*

4072. Farrimond, Thomas. (U. Waikato, Hamilton, New Zealand) **Flicker fusion measurements using a modified perimeter stand.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 881-882. Describes a portable device for the study of the flicker fusion frequency characteristics of those areas of the retina which differ in color sensitivity. Its use is briefly mentioned. The equipment is simple to operate and robust and suitable for use by students as part of their general laboratory training.—*Journal abstract.*

4073. Hall, A. C. (U. Newcastle, New South Wales, Australia) **Measures of the complexity of random black and white and coloured stimuli.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 773-774.—Describes the construction of black and white random-line stimuli having internal intersections, and a set of bicolored stimuli derived from these. The number of internal intersections as an index of subjective complexity is shown to be highly valid for both sets, and the number-of-perimetric-turns variable is also shown to have a high correlation with judged complexity. *Journal abstract.*

4074. Hofstetter, Henry. (Indiana U., Div. of Optometry) **Some observations of phantom visual imagery.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(May), Vol. 47(5), 361-366.—Describes techniques for eliciting phantom visual images of parts of an O's body in absolute darkness and under other conditions for which there are no visual stimulus correlates. Spatial, form, and

luminance attributes are discussed, together with incidental observations that might have theoretical implications.—*Journal abstract.*

4075. Lovell, D. J. (Massachusetts Coll. of Optometry) **Spectrometer performance based upon signal-to-noise toleration.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Aug), Vol. 47(8), 650-656.—In the operation of optical equipment, the optimum operation is determined by limitations imposed by noise. This is often a psychophysical concept. Trade-offs are often possible whereby superior performance can be achieved by a competent E using carefully selected functional parameters. This is indicated by examples using an infrared spectrometer.—*Journal abstract.*

4076. Moulden, Bernard. (Reading, England) **Adaptation to displaced vision: Reafference is a special case of the cue-discrepancy hypothesis.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 113-117.—12 undergraduates were exposed to a prismatically displaced view of their actively-moved right hand which was optically "stopped"; they achieved as much adaptation in this condition as in one in which they were allowed full "reafferent" stimulation. This provides further evidence against Held's "reafference" hypothesis.—*Journal abstract.*

4077. Schroeder, Stephen. (U. North Carolina) **Effects of cue factors on selective eye movements and choices during successive discrimination.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 991-998.—On a discrete-trial successive discrimination task which contained both reinforcing and redundant stimuli, 12 female and 13 male undergraduates displayed orderly distributions of fixations and choices of the stimuli. Practice decreased fixation frequencies of all stimuli without altering their distributions. Number of reinforcing stimuli had no effect on selectivity when stimuli differed distinctively but was related to selectivity when stimuli were ambiguous. Stimulus configuration affected selectivity, as did relative position cues. Results suggest a complex interaction between fixation and visual choice. (16 ref.)—*Journal abstract.*

4078. Shipley, T. & Rawlings, S. C. (U. Miami, Medical School) **Sensory direction in homogeneous binocular visual space.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 335-337.—Shifts in subjective sensory direction (local signature) occur in all sense modalities, and the dynamics of these shifts are quite similar. An experiment with 2 experienced Os is reported which indicates that this is also true for visual direction in homogeneous binocular space. It is concluded that binocular vision may be interpreted in accordance with principles of intersensory processing.—*Journal abstract.*

4079. Smith, Karl U. & Putz, Vernon. (U. Wisconsin, Behavioral Cybernetics Lab) **Dynamic motor factors in determining effects of retinal image feedback reversal and delay.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(May), Vol. 47(5), 372-383. Compared the velocity and tracking accuracy of head and eye motions of 12 Ss under conditions in which the action feedback of the 2 motions was operationally isolated and varied by means of a real-time computer system and experimental systems methods of yoking visual targets to the 2 movement mechanisms both separately and coordinately. Results show that with reversed retinal feedback: (a) velocity and accuracy of eye movements were degraded more

than head movement; (b) smooth pursuit head and eye motions were reduced to saccadic movements; (c) ocular tracking tended to dominate coordinate head-eye tracking; and (d) little dynamic adaptation occurred to the modified retinal feedback. Delay of the retinal feedback had the same relative effects on the 2 motions. More variation occurred in the velocity of eye movements than in the speed of head movements with increase in the magnitude of the delay of retinal feedback. Results support the movement-compensation hypothesis of adaptation to reversed vision by indicating that compensatory movement correction of altered feedback of eye or head motion is not possible when control of the altered feedback is restricted experimentally to the movement system affected. The response of the visual system to reversal and delay of the retinal image is a direct function of the intrinsic directional specificity of eye and head movements in governing retinal input.—*Journal abstract.*

Perception

4080. Abravanel, Eugene. (George Washington U.) **The synthesis of length within and between perceptual systems.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 327-328.—Reports 2 experiments, with 90 undergraduates each, comparing the accuracy of Ss in making length combinations visually, haptically, and intersensorially. The hypothesis that there would not be significant differences among the 3 conditions for perceptual combinations of length, because length is a highly familiar dimension that is capable of being cognitively organized, was supported. Findings are related to other research comparing intra- and intersensory processes.—*Journal abstract.*

4081. Cornwell, Henry G. (Lincoln U., Pa.) **Figure preference and personality.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 812-814.—To identify personality syndromes indicated by preferences for figures, correlations among 10 scales of the Welsh Figure Preference Test, 18 scales of the 16 PF, and 6 scales of the Allport-Vernon-Lindzey Study of Values for 50 college students were calculated. 8 figure preference variables correlated significantly with 10 16 PF and 3 Study of Values scales. The 27 significant rs suggest that: (a) rejection of the figures is symptomatic of personal inadequacy and anxiety, while acceptance of the figures indicates personal stability, self-confidence, and freedom from anxiety; (b) the more stable personality syndromes are associated with preference for complex, black, shaded, and dotted figures; (c) inconsistency of preference is positively related to general intelligence.—*Journal abstract.*

4082. Culver, Charles M. (Dartmouth Coll., Medical School) **Test of right-left discrimination.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 863-867.—Describes a test of right-left discrimination which may be useful for measuring this aspect of spatial perception in adults. Score distributions obtained from 157 student nurses are reported. Some of the test's statistical properties and empirical correlates are presented.—*Journal abstract.*

4083. Egeth, Howard & Blecker, David. (Johns Hopkins U.) **Differential effects of familiarity on judgments of sameness and difference.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 321-326.—Reports 6 experiments in which a total of 86 university summer session students indicated whether pairs of simulta-

neously presented objects were "same" or "different." In Exp. I-III, pairs of letters were shown either upright or upside down. In Exp. IV and V, pairs of trigrams were either rotated or selected according to rated meaningfulness. Analysis of RTs indicates that familiar pairs were responded to more quickly than unfamiliar pairs; however, this was true only for "same" judgments. Exp. III indicated that familiarity influenced discrimination accuracy under conditions of tachistoscopic exposure. In Exp. VI, an effort was made to disentangle the effects of meaningfulness from the effects of pronounceability. Results are compared to previous research using perceptual comparison tasks which failed to indicate any effect of familiarity. (25 ref.)—*Journal abstract.*

4084. Epstein, William. (U. Wisconsin) **Adaptation to unilocular image magnification after varying pre-adaptation activities.** *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 66-74.—Adaptation was measured after a 30-min exposure to a 5% meridional size lens, axis 90°. In the preadaptation period immediately preceding exposure, 66 undergraduates with uncorrected vision spent 10 min. sitting in the dark with both eyes covered (C), monocularly exploring the building (M), or binocularly exploring it (B). The major finding was that the magnitude of adaptation was affected significantly by the preadaptation activity: $C = M > B$. This finding is discussed in the context of a general formulation of the process of adaptation to the lens.—*Journal abstract.*

4085. Holding, Dennis H. (U. Louisville) **The amount seen in brief exposures.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 72-81.—Attempted to test the consequences of assuming that an S exposed to briefly presented tachistoscopic information does not have access to a visual image. The partial report procedure is examined under several conditions with the letter row cues immediately following stimulus exposure, and at different levels of cue delay. Ss were 12 students. The results of eye movement monitoring, and of instructing Ss where to look, agree with the guessing data of a previous experiment in showing a sharp decline in the number of letters correctly reported when the S is looking at the wrong row, in conformity with the anticipative selection hypothesis. The result of varying the S's uncertainty about what is to be reported is to vary the slope of the delay curve; with the implication that inefficient strategies of rehearsal, rather than visual image decay, are responsible for the reported delay effects.—*Journal abstract.*

4086. Horne, E. P. & Allee, M. (U. Florida) **Estimation as a function of density and contrast.** *Journal of Psychology*, 1971(May), Vol. 78(1), 87-94. Estimates of perceived number of simple dot forms, yellow-red or yellow-green, on each of 3 homogeneous backgrounds of either white, neutral gray, or black were made. Random dispersals for each of 7 frequency levels from 16-37 were displayed over large or small areas. Estimations of frequency were made by 30 female undergraduates selected as color normals. Each card was exposed 1 sec. in the Harvard tachistoscope. Underestimations of dot frequency increased with actual number. Yellow-red dot estimations were higher than yellow-green. Large area yielded higher and more accurate estimates than the smaller area. Density was significant but contrast was not significant in this experiment.—*Author abstract.*

4087. Irion, Philip E., Oyer, Herbert J., & Hardick, Edward J. **Lipreading performance as related to**

measurements of vision. *American Journal of Optometry & Archives of American Academy of Optometry*, 1971(Mar), Vol. 48(3), 231-239.—Administered the Utley test, How Well Can You Read Lips?, to 53 undergraduates. The 8 Ss who obtained the highest scores and the 8 who obtained the lowest were given complete optometric examinations. Optometric testing indicates that Ss differed primarily along the visual acuity parameter. A significant difference was found in lipreading performance as a function of acuity differences. A significant relationship was found between acuity and lipreading performance.—*Journal abstract*.

4088. Kietzman, Mitchell L., Boyle, Robert C., & Lindsay, Donald B. (Biometrics Research, New York, N.Y.) **Perceptual masking: Peripheral vs central factors.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 350-352.—Selected 2 normal vision Ss who exhibited dichoptic retroactive masking and were experienced in making visual perceptual judgments. Perceptual masking was studied under binocular and dichoptic conditions in order to separate peripheral and central interference effects. Under binocular conditions, when the test flash (TF) and the blanking flash (BF) fell on both retinas, both retroactive and proactive masking were demonstrated. Under dichoptic conditions, when the TF fell on 1 eye and the BF on the other, thus eliminating opportunity for intraretinal interference, there was partial retroactive perceptual masking and no proactive masking. Results suggest (a) that binocular proactive masking is due to peripheral light adaptation, (b) that binocular retroactive masking is due to both peripheral and central effects, and (c) that dichoptic masking is due solely to central retinocortical interference. It is proposed that dichoptic retroactive perceptual masking affords a method of investigating central perception time, i.e., the time to consolidate a perceptual experience. (25 ref.)—*Journal abstract*.

4089. Lake, R. A. & Newbigger, P. L. (U. Toronto, Ontario, Canada) **Fixed and random length foreperiods in tachistoscopic recognition.** *Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 452-459.—Describes 2 experiments (with 160 undergraduates in each) in which the effect of length and variability of foreperiod on tachistoscopic recognition are examined. It was found that foreperiods between .5 and 2 sec. had no differential effect and that for foreperiods between 2 and 8 sec. recognition thresholds were a monotonically increasing function of foreperiod length. Randomly varying foreperiod length had no significant effect. A 3rd experiment with 40 undergraduates showed that the interval between successive exposures of the recognition stimuli, which in the 1st 2 experiments was confounded with length of foreperiod, could not account for the foreperiod effects obtained. (French summary)—*Journal abstract*.

4090. Lovie, A. D. & Lovie, P. (U. Liverpool, England) **The effect of mixed visual contrast schedules on detection times for both free and horizontally structured visual search.** *Ergonomics*, 1970(Nov), Vol. 13(6), 735-741.—Performed an experiment in which Ss' detection times were compared for free and systematic visual search for a small target. The systematic search pattern consisted of a horizontal zig-zag between pairs of lines drawn on the visual field. 2 different levels of target contrast were employed. 3 groups of 4 17-28 yr. old Ss with normal vision were presented with 1 of 3 mixed stimulus schedules containing different percentages of high and low contrast

targets; each S being tested on both free and systematic visual search for that schedule. The composition of the schedules was as follows: Schedule I, 75% low and 25% high contrast; Schedule II, 50% low and 50% high; Schedule III, 25% low and 75% high. Ss were not informed about either the level of target contrast before individual trials, or the schedule to which they had been allocated. Main results were as follows: systematic search using the structured field reduced detection time for low contrast targets in Schedules I and III, and increased it for targets of the same contrast in Schedule II. High contrast targets showed an increased detection time for all schedules with the systematic search. Results are interpreted in terms of the interaction of the relative amount of contrast-uncertainty, contained by each schedule, with the condition of the visual field. (French & German summaries)—*Journal abstract*.

4091. Marcinkech, A. J. (Comenius U., Faculty of Pedagogy, Trnava, Czechoslovakia) **Zraková percepcia podľa učenia univ. prof. PhDr. Jána Horvátha na Trnavskej univerzite.** [Sight perception according to the teaching of Prof. Jan Horvath at the Trnava university.] *Jednotná Škola*, 1969(Jun), Vol. 21(6), 532-544.—Presents a selection and summary of the teaching of Jan Horvath (1732-1799) on sight perception. (Russian summary)

4092. Munoz, S. R. & Newbigger, P. L. (Sir George Williams U., Montreal, Quebec, Canada) **Some effects of an auditory ready signal on tachistoscopic word recognition.** *Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 460-475.—Describes 4 experiments which are variously concerned with the effect on tachistoscopic recognition of the intensity of the ready signal, the length of the foreperiod, the effect of combining an auditory ready signal with a visual fixation point and the effect of different intensities of the ready signal when words differing in difficulty (frequency) are presented for recognition. Ss were 72, 30, 86, and 40 men and women in each experiment, respectively. The main findings were: (a) that intense ready signals have a disruptive effect whereas less intense signals have a facilitative effect; (b) that a visual fixation point attenuates the effect of a ready signal; (c) that recognition thresholds increase as foreperiods are lengthened; and (d) that the effects of ready signal intensity are demonstrable only with the most difficult recognition task. (French summary) (17 ref.)—*Journal abstract*.

4093. Newbigger, P. L. (McMaster U., Hamilton, Ontario, Canada) **Transfer of training from reaction time to tachistoscopic recognition.** *Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 476-485.—Describes 2 experiments in which RT practice preceded a tachistoscopic recognition task. Ss were 108 and 180 undergraduates, respectively. The amount of positive transfer obtained was shown to be a function of both the type of RT task and the amount of RT practice. This transfer was attributed to the learning of an attentional response to the foreperiod which was the same length in both tasks. (French summary)—*Journal abstract*.

(Queens Coll., City U., New York) **Perceptual reversals, eye blinks and "preferred orientation."** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 902.—Presents a resume of a paper by J. Orbach and E. Zucker where the problem of eye-blinks is considered in relation to the theory of saturation of orientation.—P. Hertzberg

4095. Pálffy, Zoltán. (Formative Teaching Inst., Budapest, Hungary) **Adatok a képi elsajátítás lélektanához.** [Data concerning the psychology of

pictorial space perception.] *Pszichológiai Tanulmányok*, 1968, No. 11, 167-183.—On the basis of its cybernetic interpretation and the social determination, internal and external factors and conditions bearing on pictorial space perception have been examined. Perspective space perception is a specifically human quality of visual perception that is formed by objectivizations (picture plane, projective rays, coordinates, perspective pictures) and operational structures (operations serving the external realization of objectivizations and their subjective acquisition). These processes enable man to internalize perceptually and intellectually the appearance of perspectives as a function of an objective necessity (i.e., objective law). Perception corresponds not only with the constancies (the real and constant spatial and form-characteristics of objects), but also with the perspective appearance. The 1st step leading to the acquisition of the perception of spatial changes was found to be differentiation (adequation) of points situated in different depths but appearing to be in the same place, i.e., programing of the procedures of analysis and synthesis that are necessary for the graphic representation of the coincidence. The explicit forms of these operations, as well as the succeeding external and internal complex operations are acquired by the child and interiorized with the help of operational models and structures acquired from the community. (Russian summary)—*English summary*.

4096. Smith, Olin W. & Barut, Clara. (Bowling Green State U.) **Relation of spatial abilities to reversal rates of Necker cubes varying in degree of completeness.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 760-762.—1 hypothesis was that reported reversal rates of Necker cubes with 6-in horizontals and verticals that varied in 5° of completeness would correlate significantly with 3 measures of spatial visualization. The second hypothesis was that 6-in cubes would result in lower reversal rates than did the 3-in cubes used by O. W. Smith, N. Imparato, and J. E. Exner. The 1st proved to be untenable while the 2nd remained tenable in a test with 40 male and female undergraduates. Individual differences in reversal rates were large but fairly consistent since the correlations among reversal scores ranged from .71-.97, with a median of .88.—*Journal abstract*.

4097. Tánczos, Zsolt. (Hungarian Academy of Sciences, Psychology Inst., Budapest) **Az érzéketlen szerveződés vizsgálatának néhány elvi kérdése.** [Some theoretical problems of investigating perceptual organization.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 45-50.—Considers the significance of spatial-temporal organizational (coding) units being interpreted as dynamic features, and of neural coding, when determining perceptual qualities. The fact that different functional forms may serve as a basis for producing identical perceptual qualities is related to von Neumann's findings on the characteristics of natural automata. On the basis of investigations into stroboscopic movements and the connection between spatial localization and eye movements, the relative equivalence in the functions of configurative organizational forms to central motor determination, and their complementary function in determining perceptual qualities is demonstrated. From this point such things as configurative organization, plastic impressionability, as well as social determination and experimental aspects in the study of perception are approached. (Russian summary) (19 ref.)—*English abstract*.

Size & Distance & Depth Perception

4098. Dawson, William E. (U. Notre Dame) **Magnitude estimation of apparent sums and differences.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 368-374.—Undergraduate, graduate, and staff member Os 1st scaled 2 continua by magnitude estimation: apparent area of circles and loudness of 1000-Hz tones. Os then gave magnitude estimations of apparent sums and apparent differences for 15 pairs of stimuli on each of the 2 continua. The scales for sums and differences were in some cases nearly linearly related to the power function obtained when the same Os scaled the underlying continuum. However, systematic departure from linearity was the usual result. The power law exponents obtained were generally smaller than those usually reported for the 2 sensory continua. (18 ref.)—*Journal abstract*.

4099. McCain, Claude N. & Karr, A. Charles. **Color and subjective distance.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Aug), No. 20-70, 9 p.—Selected 16 Os from a group of 29 soldiers on the basis of color and far-vision scores. Os adjusted the position of a white or colored rod until it seemed to be alongside a reference white or colored rod. The colors used were blue and red of matched luminances. Os tended to see the red rods as nearer and the blue rods as further away. It is concluded that red and blue are used as cues for depth perception.—*Journal abstract*.

4100. Williams, T. David. (Indiana U., Div. of Optometry) **Vertical disparity in depth perception.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(May), Vol. 47(5), 339-344.—Determined the apparent frontoparallel plane (AFPP) under 3 different conditions of vertical disparity using a 2-alternative forced-choice experimental format. Representative data for 1 O are given in which response to vertical disparity was found to lie in the range 6.25-8° of arc AFPP rotation/percent vertical angular size difference. Differences between data from the 3 stimulus conditions were significant at the .05 level by probit analysis. The stereoscopic behavior of the Ss agreed with a systems-approach model for stereopsis proposed by K. N. Ogle and B. Julesz.—*Journal abstract*.

Color Vision

4101. Chapanis, Alphonse & Overbey, Charles M. (Johns Hopkins U.) **Absolute judgments of colors using natural color names.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 356-360.—Required 10 male and 10 female undergraduates to select from a list of 36 common color names the correct name for each of 36 Munsell colored chips. On their 1st trial, with no prior training and without having seen the set of stimuli in advance, Ss gave results that were as good as, or better than, previous Es have reported at the conclusion of much longer experiments. On the last trial (Trial 10), Ss transmitted about 5.07 bits of information, corresponding to the perfect discrimination of more than 33 colors. These figures approach the upper limit possible with 36 colors (5.17 bits). Reasons are given to suggest that the so-called human "channel capacity" to tasks of this kind could be even greater than found here.—*Journal abstract*.

4102. Chason, L. Ralph & Berry, Gene A. (U.S. Air Force Academy, Colorado Springs, Colo.) **The effect of white noise on color vision.** *Proceedings of the Annual*

Convention of the American Psychological Association, 1971, Vol. 6(Pt. 2), 585-586.—60 18-22 yr. old Air Force cadets were assigned randomly to the 12 cells of a completely randomized factorial design, $2 \times 2 \times 3$. The perceived intensity of red, green, and blue lights was measured under conditions of dark-adaptation or non-dark-adaptation, and silence or white noise at 100 db. No significant differences were found between dark-adaptation and non-dark-adaptation. Significant differences were found between silence and white noise conditions ($p < .01$), as well as between the 3 colors ($p < .001$). Light sensitivity was increased under white noise conditions. The data are seen as relevant to design specifications in human engineering.—*Author abstract.*

4103. Kamlet, Arthur S. & Egeth, Howard E. (U.S. Army Human Engineering Lab., Behavioral Research Lab., Aberdeen Proving Ground, Md.) *Note on construction of Stroop-type stimuli. Perceptual & Motor Skills, 1969(Dec), Vol. 29(3), 914.*—Describes the success of using plastic label tapes and an appropriate embossing tool to generate Stroop-type stimuli. 2 experiments, with 10 laboratory workers and 12 undergraduates, respectively, are cited. These show that the label-tape stimuli are at least as effective in producing Stroop-type interference as are incongruously colored names.—*P. Hertzberg.*

4104. Lindauer, Martin S. (State University Coll. New York, Brockport) *Color preferences among the flags of the world. Perceptual & Motor Skills, 1969(Dec), Vol. 29(3), 892-894.*—Color use interpreted as preferences among the flags of 139 independent nations of the world included red, blue, green, and yellow. With 1 exception (green among African states), each color was equally preferred among 6 geographic groups of nations. In addition, white was preferred to black, colors were horizontally placed, and symbols were more likely to be present than not. Data were related to judgments made by individuals of isolated colors, to differences in inferred need achievement between countries, and to the role of language and culture in color discrimination and preference.—*Journal abstract.*

Form & Pattern Discrimination

4105. Egeth, Howard. (Johns Hopkins U.) *Laterality effects in perceptual matching. Perception & Psychophysics, 1971(Apr), Vol. 9(4), 375-376.*—Conducted 2 experiments with 36 and 12 right-handed male undergraduates in which Ss had to indicate whether pairs of simple geometric forms were "same" or "different." In Exp. I the 2 forms were either both in the left or both in the right visual hemifield. RTs were unaffected by the locus of the stimuli. In Exp. II, in addition to left and right pairs, there were pairs in which 1 stimulus was on the left and the other on the right. Under these conditions, RTs were faster for pairs totally on the left than for pairs totally on the right. Data support the theory that implicit scanning patterns are important in determining laterality differences. When such scanning is not involved and when simple nonverbal stimuli and responses are employed, laterality differences are eliminated.—*Journal abstract.*

4106. Hastings, D. W. & Evans, S. H. (Texas Christian U., Inst. for the Study of Cognitive Systems) *The selection of local features for pattern identification: An exploratory study. U.S. Army Human Engineering Laboratories Technical Memorandum,*

1970(Mar), No. 5-70, 17 p.—Proposes a feature analytic process as a basic mechanism in the encoding and storage of visual shapes by humans. It is hypothesized that local features, encoded as feature prototypes plus deviations, are stored in memory according to their positional relationships in the pattern. 2 studies with 12 and 16 undergraduates explored methodologies for the study of feature selection and attempted to determine if Ss would agree in their selection of features. Results indicate that Ss do agree in their selection of features and tend to repeat the selection of similar visual configurations as features across patterns. It is proposed that the consistency of feature selection, both within and between patterns, is a function of both the informational properties of the feature and the population of features present in the patterns.—*Journal abstract.*

4107. Knoll, Ronald L. & Clark, Herbert J. (Antioch Coll.) *The physical characteristics and factor structure of a selected set of random shapes. USAF AMRL Technical Report, 1969(Jun), No. 69-8, 20 p.*—Describes 120 uncurved random shapes frequently used in studies of form perception in terms of 12 nearly orthogonal physical measures of shape. Calculation of the measures is described and their unique characteristics are pointed out. It is suggested that curved shapes may also be described in terms of these measures, but that additional measures descriptive of the curved segments in the perimeter of the shape are required. Although random shapes were examined in this investigation, techniques developed and conclusions arrived at are equally relevant to the specification of some of the characteristics of targets in the real world.—*USAF AMRL.*

4108. Lerner, Richard M. (Eastern Michigan U.) *Note on Knehr's Span of Apprehension Test. Perceptual & Motor Skills, 1969(Dec), Vol. 29(3), 887-891.*—60 undergraduates were administered Series I and II of the Span of Apprehension Test (SAT). In both series of this test random patterns of from 3-10 dots are presented, but Series II includes grid lines in the field. Response errors on Series I were almost all in overestimating the number of dots presented; with Series II significant decreases in overestimation and increases in underestimation were obtained. This response reversal was found despite individual and/or group differences in modes of response to the SAT. In explanation of these findings it was hypothesized that with the inclusion of grid lines in Series II a cognitive strategy different from that used for Series I was evoked.—*Journal abstract.*

4109. Vitz, Paul C. & Todd, Thomas C. (New York U.) *A model of the perception of simple geometric figures. Psychological Review, 1971(May), Vol. 78(3), 207-228.*—Presents a model of how humans perceive straight-line 2- and 3-dimensional geometric figures, e.g., triangles, trapezoids, and cubes. Major characteristics of the model are: (a) a figure is represented as a hierarchy of perceptual elements—lines, angles, areas; and (b) the process of perceptually organizing a figure is portrayed as a stochastic sampling of the elements. The total number of trials to sample the elements corrected by a measure of redundancy is proposed as a measure of the figure's complexity. In experiments with 20 male and 20 female adults, the model successfully predicted the judged complexity of a wide variety of 2-dimensional figures; with some additional rationale it also predicted the perceived 3-dimensionality of figures which can be seen in either 2 or 3 dimensions, e.g., necker cubes. In

general, the predictions of perceived 3-dimensionality are supported but there are discrepancies and other important unresolved problems. (26 ref.)—*Journal abstract.*

Eye Movement

4110. Gordon, I. E. (U. Exeter, England) **Eye movements during search through printed lists.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 683-686.—Records eye movements during search through a series of cancellation tasks. Ss were 4 male and 2 female postgraduate students and staff at a university. The main response to a change in the degree of complexity of the search lists was an increase in the number of fixation pauses and visual regressions, i.e., the average duration of visual fixations did not change significantly.—*Journal abstract.*

4111. Hale, S. M. & Simpson, H. M. (Carleton U., Ottawa, Ontario, Canada) **Effects of eye movements on the rate of discovery and the vividness of visual images.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 242-246.—2 studies (Ns=45 female undergraduates in Exp. I, and 18 in Exp. II) investigated the effects of eye movements on the rate of discovery and the vividness of visual images. Eye movements were manipulated by having 3 conditions: (a) Ss were instructed to make eye movements while generating images to noun pairs; (b) Ss were instructed not to make eye movements, but to think about making eye movements while generating images to noun pairs; and (c) Ss were instructed not to make eye movements and not to think about making eye movements while generating images to noun pairs. In addition, the ease of generating images was manipulated by using noun pairs that differed in their image-evoking capacity; 5 of the noun pairs consisted of high imagery-evoking nouns and 5 consisted of low imagery-evoking nouns. The 2 experiments were similar, with the exception that a between-groups design was used in Exp. I, and Exp. II employed a within-Ss design. The results of both experiments showed highly significant effects of noun-pair type on both the rate of discovery and the vividness of images, with the fastest and most vivid images occurring to the high-imagery noun pairs. The effects of the eye-movement conditions on the rate of discovery and the vividness of the images were not significant in either experiment, and these findings are discussed in terms of the relationship of ocular activity to imagery. (17 ref.)—*Journal abstract.*

4112. McCormack, P. D. & Clemence, G. D. (Carleton U., Ottawa, Ontario, Canada) **Monitoring eye movements during paired-associate learning in a retroactive inhibition setting.** *Canadian Journal of Psychology*, 1970(Jun), Vol. 24(3), 184-193.—Monitored eye movements during the learning and relearning of a 7-pair A-B list for 64 undergraduates in 4 groups, 2 of these being required to learn an AC list in the interim and 2 being given interpolated activity designed to produce minimal interference with the relearning of A-B. Retroactive inhibition was demonstrated and the fixation and eye-movement data for original learning were consistent with earlier studies and with a 2-stage interpretation of paired-associate learning. The visual monitoring data for relearning were more compatible with a selector mechanism account of retroactive inhibition than with one of competition, unlearning, or trace decay. (French summary) (24 ref.)—*Journal abstract.*

4113. Schmidt, Jack G. & Smith, Karl U. (U. Wisconsin, Behavioral Cybernetics Lab.) **Feedback analysis of eye tracking of auditory and tactual stimuli.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1971(Mar), Vol. 48(3), 204-209.—Compared eye movement errors in 16 Ss in tracking visual, auditory, and tactual targets that moved in comparable continuous paths to determine if inter-receptor feedback tracking methods may be of significance in developing directional ocular attention in blind children. Findings were that although the eyes cannot track auditory and tactual stimuli nearly as accurately as they can visual targets, they can orient to changes in position and direction of auditory and tactual targets. To perform smooth pursuit movements, the eyes require dynamic retinal feedback of their own movements. When attempting to track auditory and tactual target stimuli, the eyes perform saccades that shift more or less accurately with changes in target direction and position. The possibility exists for developing feedback aids to the blind in detecting eye position during developmental training of directional ocular attention to auditory or tactual stimuli.—*Journal abstract.*

Brightness & Contrast Discrimination

4114. Beck, Jacob. (U. Oregon) **Surface lightness and cues for the illumination.** *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 1-11.—Os who judged the lightness of 2 equally illuminated targets, 1 of which cast a shadow on a background and 1 of which did not, perceived the target that cast a shadow (and thus seemed illuminated by a spotlight) as darker than the other target. Results confirm earlier findings that the perception of surface lightness may be affected by cues for the conditions of illumination as well as by the inhibitory interactions underlying contrast. The hypothesis is that such cues affect the perception of lightness by creating the impression of a "special" illumination. (15 ref.)—*Journal abstract.*

4115. Engel, G. R. (U. Waterloo, Ontario, Canada) **Tests of a model of binocular brightness.** *Canadian Journal of Psychology*, 1970(Oct), Vol. 24(5), 335-352.—Tested a model of binocular brightness mixing which describes binocular brightness as the vector sum of the 2 monocular brightnesses where each monocular brightness is weighted according to an autocorrelation function that measures the relative amounts of contour and contrast in the 2 monocular views. 3 experiments were carried out with 2 Os, and show that binocular brightness interactions depend on the size and shape of the monocular stimuli in ways predicted by the model. (French summary)—*Journal abstract.*

4116. Remole, Arnulf. (U. Waterloo, School of Optometry, Ontario, Canada) **Spatial characteristics of the border enhancement region in a flickering field.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Oct), Vol. 47(10), 779-786.—When the eye is stimulated with an intermittently illuminated area bordered by a dark surround, the portions of the area adjoining the border will take on a greater apparent brightness than the remaining area. This region of enhanced brightness resembles nothing as much as a halo extending from the border into the field. The main findings were obtained with 1 S, while 3 others were tested to confirm the universality of the results. This study was a preliminary investigation of how this

perceived halo varies with the intermittence rate, pulse duration, and pulse luminance. Spatial characteristics of the border enhancement halo were found to be closely related to these stimulus parameters.—*Journal abstract.*

AUDITION

4117. Breger, Ilana. (New York Student Consultation Center, N.Y.) **The affective response in the perception of sound stimuli.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 317-322.—A "judged group norms" approach was used to obtain normative data on the affective response to meaningful sound. Auditory projective stimuli were rated for pleasantness on a 5-point scale by 140 Ss. The findings suggest a measure of consensus along with individual differences regarding relative pleasantness of sounds. Results indicate that: (a) most of 35 sounds were perceived as unpleasant; (b) 12 sounds differed in pleasantness; (c) test-retest reliability was acceptable; (d) males and females tended to rate similarly; and (e) there were consistent individual differences in rating patterns. It seems possible to establish general measures of consensus about the relative pleasantness of meaningful sounds, implying that the psychological examiner can evaluate standard and unique responses to meaningful sound.—*Author abstract.*

4118. Bryden, M. P. (U. Waterloo, Ontario, Canada) **Attentional strategies and short-term memory in dichotic listening.** *Cognitive Psychology*, 1971(Jan), Vol. 2(1), 99-116.—While listening to lists of dichotically presented numbers, Ss were instructed to attend carefully to the material arriving at 1 ear. They were then instructed either to report the attended items first (AI order) or to give the unattended items prior to the attended ones (UA order). Regardless of report instructions, the attended ear showed a slightly bowed serial position curve while the unattended ear showed a sharply increasing function. Reporting the attended ear 2nd produced a greater loss in accuracy for attended items than was observed with the unattended items when they were reported 2nd. These results indicate that preperceptual auditory storage (echoic memory) is relatively long-lasting but can be disrupted by subsequent auditory input. Attended items, unlike unattended items, are lost through verbal or processing interference. (23 ref.)—*Journal abstract.*

Perception

4119. Ali, Latif; Gallagher, Tanya; Goldstein, Jeffrey, & Daniloff, Raymond. (U. Illinois) **Perception of coarticulated nasality.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 538-540.—Prepared CVC and CVVC syllables in which the final consonants were either nasal consonants (/m/, /n/) or nonnasal consonants. The entire final consonant along with its vowel-consonant transition was spliced away. The resulting CV and CVV syllables along with carrier phrases were spliced at random onto a tape for presentation to listeners who predicted whether the missing consonant was nasal or nonnasal. Ss were 22 female undergraduates. Results indicate that the presence of nasal consonants can be predicted very well. It is hypothesized that listeners utilize this information to lighten the phoneme-processing load. Such perceptually significant coarticulation of velar opening across the

vowels in CVV nasal-type sequences probably has counterparts in the coarticulation of other articulatory gestures. In this way, perception uses or follows production. (15 ref.)—*Journal abstract.*

4120. Bell, Donald W. & Nixon, James C. (Stanford Research Inst., Sensory Sciences Research Center, Menlo Park, Calif.) **Reliability of ratings in an auditory signal detection experiment.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 435-439.—50 samples of noise waveforms (N) and 50 samples of signal-plus-noise waveforms (SN) were rated on 10 occasions by 4 listeners. The listeners decided whether the waveform was N or SN, and rated the degree to which the waveform had the N or SN quality. The signal was a 1-kHz tone 500 msec. in duration. Both signal and noise were gated. Results indicate greater reliability for ratings of SN waveforms than for ratings of N waveforms. Results also suggest that listeners can be quite consistent in rating some waveforms, but still not agree with each other.—*Journal abstract.*

4121. Botsford, James H. (Bethlehem Steel Corp., Pa.) **Theory of temporary threshold shift.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 440-446.—Temporary threshold shift (TTS) is generally believed to grow during noise exposure and recover afterwards in proportion to the logarithm of time. However, these logarithmic laws of TTS disagree with experimental observations made very early or very late in these processes. Better agreement with experiment is obtained if TTS is regarded as the sum of 2 components that vary exponentially with time. Published information on TTS was analyzed to determine the properties of these 2 components. Only 1 of the components is believed to be associated with permanent hearing loss resulting from noise exposure, and its simple electrical analog makes possible the construction of a TTS meter for appraising noise hazard. The analysis also revealed 2 other components of TTS that account for the "bounce" sometimes observed very early in the recovery process.—*Journal abstract.*

4122. Cuddy, Lola L. (Queen's U., Kingston, Ontario, Canada) **Absolute judgment of musically-related pure tones.** *Canadian Journal of Psychology*, 1971(Feb), Vol. 25(1), 42-55.—Studied accuracy of pitch judgment for 3 sets of 12 sine-wave tones in 3 experiments with 34 14-38 yr. old musical listeners (undergraduates and high school students). Tone sets differed only in the spacing of stimulus frequencies within the range 175-2093 Hz. The frequencies for triad spacing were derived from the (well-tempered) tonic chord with root F₃; for keyboard interval spacing, each frequency corresponded to a different musical note; for arithmetic interval spacing, frequencies were spaced at predetermined arithmetic intervals without specific concern for musical correspondence. Listeners showed most accurate judgment and most rapid learning of pitch for triad spacing, and showed no difference between keyboard interval and arithmetic interval spacing. Comparison of 2 inter-stimulus durations, 3 sec. and 8 sec., indicated at the slower rate of presentation a small but significant improvement in judgment of the lower 6 tones for both triad and keyboard interval spacing, and an increased number of octave errors for the higher 6 tones for triad spacing. Nonmusical listeners showed no differences between sets or rates of presentation. Some characteristics of decision rules for musical pitch recognition are discussed. (French summary)—*Journal abstract.*

4123. Elfner, Lloyd F. (Florida State U.) **Continuity in alternately sounded tonal signals in a free field.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 447-449.—Reports an experiment that employed 20 normally hearing listeners (undergraduates) who demonstrated an ability to concentrate on an interrupted signal that alternated with a shorter, more intense signal. An attempt was made to investigate the effects of the frequency relationship between the 2 components, to determine the effect of angular separation of the 2 components, and to demonstrate continuity effects in a free field. Results indicate a definite frequency effect and a significant though small effect due to angular separation on the continuity threshold.—*Journal abstract.*

4124. Elliott, Lois L. (U.S. Office of Education, Bureau of Education for the Handicapped, Washington, D.C.) **Auditory memory for one and two tones.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 450-456.—Examined pitch memory for 1 and for 2 successive tones in 2 experiments which employed a method of adjustment procedure (Exp. I) and a recognition (4-alternative-forced choice) task (Exp. II). 17 laboratory research assistants served as Ss. Frequency ratio of the 2-tone targets was either simple (a musical third or fifth) or complex. Time between target and comparison tone(s) was either silent or filled with 2 intervening tones. The memory DL for each of 2 tones was about 1.5-2 times larger than the DL for 1 tone. The DL for pairs of tones with complex frequency ratios was under some circumstances, larger than for pairs of tones with simple ratios. For "good pitch discriminators," the task must become more difficult before ratio complexity affects performance than is true for "poor pitch discriminators." At least 2 skill components, frequency analyzing power and memory, were present in these tasks, and consistent individual differences occurred for both. (16 ref.)—*Journal abstract.*

4125. Flottorp, Gordon; Djupesland, Gisle, & Winther, Finn. (Rikshospitalet, Inst. of Audiology, Oslo, Norway) **The acoustic stapedius reflex in relation to critical bandwidth.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 457-461.—Investigated the threshold of the acoustic stapedius reflex in man by means of changes in acoustic impedance of the ear. Ss were 16 20-36 yr. old males and females. The contralateral ear was stimulated by using bands of noise and complex tones with various bandwidths. Experiments show that the reflex threshold, expressed in db. re $2.10 \cdot 10^{-4} \text{ N/m}^2$, was almost constant for bandwidths less than a specific value and designated as "critical bandwidth." When the bandwidth was further increased, a decrease in the reflex threshold at approximately 3-6 db/octave was observed. Assuming that the stapedius reflex mechanism is loudness governed in persons with normal hearing, findings confirm the existence of a critical bandwidth in loudness summation. In addition, findings indicate that the basis for the critical-band mechanisms is located in the peripheral part of the auditory system, probably in the cochlea. (32 ref.)—*Journal abstract.*

4126. Leshowitz, Barry. (Arizona State U.) **Measurement of the two-click threshold.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 462-466.—Os discriminated between a pair of 10- μsec pulse and a single 20- μsec pulse having the same total energy. The independent variable was the time, δT ,

between the 2 10- μsec pulses. The stimuli were also presented as elements in a periodic pulse train. The δT required for resolution of 2 clicks (2-click threshold) was 10 μsec . Whereas the addition of a steady background noise produced a remarkably small change in the magnitude of the 2-click threshold, performance deteriorated markedly when the pulses were low-pass filtered. It appears that discrimination of slight changes in the energy spectrum of the 2 transient signals, especially in the high-frequency region (8000 Hz. and above), underlies the ear's sensitivity to a temporal discontinuity.—*Journal abstract.*

4127. Patterson, James H. & Green, David M. (U. California, San Diego) **Discrimination of transient signals having identical energy spectra.** *Journal of the Acoustical Society of America*, 1970(Oct), Vol. 48(4, pt. 2), 894-905.—Generated pairs of waveforms having identical energy spectra, using a technique developed by D. A. Huffman. A pair of such waveforms differ only in their phase spectra. The discriminability of such waveforms was measured under various conditions. The total duration of the waveforms was varied as well as the nature of the differences in their phase spectra. Results of these experiments with undergraduates suggest that the ear can discriminate differences in temporal order as small as 2.5 msec. In later experiments this discriminability among pairs was studied when both waveforms were partially masked by noise. Some pairs can be discriminated when only 6 db. above their masked threshold.—*Journal abstract.*

4128. Ptacek, Paul H. & Pinheiro, Marilyn L. (Case Western Reserve U.) **Pattern reversal in auditory perception.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 493-498.—Perception of auditory patterns based on an intensity difference was tested in 30 16-40 yr. old normal-hearing Ss under binaural, monaural, and dichotic listening conditions. Each auditory pattern included 3 temporally spaced white-noise bursts involving 2 elements, i.e., soft (S) and loud (L). Patterns included SLS, LSL, LLS, SSL, LSS, and SLL. The loud element in the patterns remained at a constant intensity throughout, with the soft elements attenuated from 5-20 db. in different sets of patterns. Patterns were presented at 50-db SL. Ss needed a 10-db intensity difference within a pattern in order to recognize it correctly $\frac{1}{2}$ the time, although the just noticeable difference for white noise is about .5 db. This seems to indicate that the pattern recognition task is a higher auditory function than simple discrimination of intensity differences. An unexpected finding was a large number of complete pattern reversals or mirror images which accounted for 30-40% of errors across listening conditions and intensity-difference levels. Symmetrical patterns were more commonly reversed than asymmetrical patterns. It is suggested that reversals of auditory patterns may occur in a manner similar to figure and ground reversal in vision. (19 ref.)—*Journal abstract.*

4129. Rosinger, George; Nixon, Charles W., & Von Gierke, Henning E. (Battelle Memorial Inst., Columbus Lab., Ohio) **Quantification of the noisiness of "approaching" and "receding" sounds.** *Journal of the Acoustical Society of America*, 1970(Oct), Vol. 48(4, Pt. 1), 843-853.—Describes the 1st phase of a research program designed to quantify subjective responses to time-varying sounds grossly approximating those produced by aircraft flying over an O at rest. The basic sounds employed represented "approaching" and "receding" sources that

continuously increased or decreased in intensity and/or frequency over a period of 15.25 sec. The comparative annoyance or noisiness of such sounds was evaluated by means of paired comparison and individual adjustment judgments. For the 3 experiments conducted with 72 16-27 yr. old undergraduates and high school students, the findings indicate that (a) Signals representing an approaching sound were generally judged more annoying than those representing a receding sound—in spite of the fact that the approaching and receding signals contained the same average intensity and frequency content over signal duration. (b) Signals with time-varying components—whether intensity or frequency—were judged to be noisier than signals with non-time-varying components. (c) Time-varying intensity components appeared to have a greater influence on judgments of noisiness than did time-varying frequency components. And (d) on the average, only small nonsystematic differences in noisiness were found as a function of the 3 frequency conditions investigated (125-, 1000-, and 4000-Hz-band center frequency).—*Journal abstract.*

Speech Discrimination

4130. Aaronson, Doris; Markowitz, Nancy, & Shapiro, Hollis. (New York U.) **Perception and immediate recall of normal and "compressed" auditory sequences.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 338-344.—Varied the ratio of speech-to-pause time, for a fixed presentation rate, in 3 experiments with 16, 24, and 26 undergraduates. Ss recalled 7-digit sequences or monitored for item or order information in addition to recall. Removing 33% of the speech and substituting pause time improved recall accuracy and monitoring RTs. Results suggest that loss of order information in recall may result from cumulative perceptual delays when adequate pause time is unavailable. (40 ref.)—*Journal abstract.*

4131. Gupta, J. P., Agrawal, S. S., & Ahmed, Rais. (Aligarh Muslim U., India) **Perception of (Hindi) vowels in clipped speech.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 567-568.—Studied the structure of perceptual confusions among 10 Hindi vowels in clipped speech. Front vowels were recognized better than back vowels. It was found in most cases that the 1st and 2nd probable incorrect vowels have either openness of the vocal tract or place of articulation in common with the corresponding correct vowel. This finding supports the view that vowels can be perceived by these 2 distinctive features only. The same features (dimensions) have been used by W. A. Wickelgren to explain the coding of vowels in short-term memory.—*Journal abstract.*

4132. Haggard, Mark P. (Psychological Lab., Cambridge, England) **Encoding and the REA for speech signals.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 34-45.—A number of different possible explanations are distinguished for the findings on the right ear advantage (REA) for speech signals varied in their acoustic and phonetic properties. 2 experiments are reported, (Ss were normal-hearing right-handed undergraduates), using synthesized semi-vowels and vowels in monosyllable word frames. Both show REA. The detailed results of both experiments support the idea that a complicated "encoded" relationship between the acoustical stimulus and the re-

sponse phoneme is a necessary condition for the REA, but that the encoding need only be signaled by an acoustical "trigger feature" in the stimulus; a task requiring a perceptual decoding is not necessary for REA to occur. (15 ref.)—*Journal abstract.*

4133. Warren, Richard M. (U. Wisconsin, Milwaukee) **Identification times for phonemic components of graded complexity and for spelling of speech.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 345-349. Measured identification time for targets in speech in terms of the number of phonemes occurring between the target and response. 36 and 9 staff members, visiting scientists, and graduate students served as Ss in 2 experiments. Auditory targets in the main experiment were at 3 levels of phonetic complexity: (a) monosyllabic words or nonsense syllables, each containing 4 phonemes; (b) clusters (vowel + consonant) consisting of the 2nd and 3rd phonemes within these syllables; and (c) individual phonemes within these clusters. Identification time was always shorter for a than for b or c. The effect of semantic and grammatical context upon identification was small. Plosive consonants which did not begin a syllable generally could not be identified as isolated phonemic targets, although they could be identified readily as part of a cluster. Letter targets corresponding to the spelling of the auditory stimulus permitted identification of plosive consonants, and in general followed different rules than the phonemic targets. Additional observations concerning individual targets are made.—*Journal abstract.*

4134. Warren, Richard M. & Warren, Roslyn P. (U. Wisconsin, Milwaukee) **Auditory illusions and confusions.** *Scientific American*, 1970(Dec), Vol. 223(6), 30-36.—2 auditory illusions, "phonemic restoration" and the "verbal transformation effect," provide techniques for studying the perceptual organization of heard speech. Studies of these illusions provide information concerning perceptual processes involved in the grouping of speech sounds, the resolution of acoustic ambiguities, and age-related changes in the processing of verbal input.—P. Tolin.

Audiometry

4135. Levitt, H. (City Coll., City U. New York) **Transformed up-down methods in psychoacoustics.** *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 467-477.—During the past decade a number of variations in the simple up-down procedure have been used in psychoacoustic testing. A broad class of these methods is described with due emphasis on the related problems of parameter estimation and the efficient placing of observations. The advantages of up-down methods include simplicity, high efficiency, robustness, small-sample reliability, and relative freedom from restrictive assumptions. Several applications of these procedures in psychoacoustics are described, including examples where conventional techniques are inapplicable. (38 ref.)—*Journal abstract.*

4136. Lipák, János & Váczi, Péter. (Debrecen U. of Medicine, Hungary) **A hangreakcióidő vizsgálata.** [Examination of auditory reaction time.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 211-215.—Examined the response time for 32 Hungarian speech sounds by 30 university students using a simple method for the measurement of auditory rather than sensorimotor RTs. Because of the method's simplicity and its intimate

association "with psychic functioning, it provides a wide range of variation for both stimuli and responses. Consequently, it may be usefully applied in logopedic, linguistic, developmental psychologic, neuropsychiatric, and information theoretical investigations." (English & Russian summaries)—*M. Moore.*

4137. McPherson, Marion W. & Pursell, Elliott. (U. Akron) **One cost of precision.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 717-718.—Auditory research undertaken by numerous disciplines has employed the durable and versatile tuning fork and has been plagued by the confounding properties inherent in this instrument. The results of the research yielded unreliable RLs and difference limens. In accounting for these discrepancies, procedures were more often indicated than was a tangible source, the equipment. Loudness of tuning forks could not be adequately controlled but they were used to compare responses, an honoring of the subject matter of psychology that is not encountered in experimentation which deals with response-no response categories.—*Author abstract.*

CHEMICAL SENSES

SOMESTHESIA

4138. Johnson, Robert E. & Kirkendall, Don R. (Ohio U.) **Psychophysiologic responses to rotary motions.** *Research Quarterly*, 1970(Dec), Vol. 41(4), 489-495. To investigate the phenomenon of psychophysiologic responses to a coriolis force experienced in the fluid-filled semicircular canals, 10 18-30 yr. old male Ss were tested on a low friction platform. The platform was rotated at a constant angular velocity and the S was instructed to roll his head in a given direction. All Ss experienced a force of pitching when a given direction of rotation was established for the platform and head roll. When studying the psychophysiologic responses, a significant apparent displacement of a target point was experienced by the Ss. The displacement seemed to have a relationship with the direction of rotation and head roll.—*Journal abstract.*

4139. Verrillo, Ronald T. (Syracuse U., Lab. of Sensory Communication) **Vibrotactile thresholds measured at the finger.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 329-330. Determined absolute vibrotactile thresholds over the distal pad of the middle finger and thenar eminence of the right hands of 5 Ss. Measurements were made using 8 frequencies from 25-700 Hz. and 7 contactor sizes from .0008-1.3 cm². When plotted as a function of frequency, the threshold curve measured at the fingerpad with a .005-cm² contactor was U-shaped, with a maximum sensitivity in the region of 250 Hz. When plotted as a function of contactor size, the threshold decreased at a rate of 3 db/doubling of the area.—*Journal abstract.*

ENVIRONMENTAL EFFECTS

4140. Gheron, E. & Dimitrova, A. **Effects of middle-height mountain conditions upon balance indices in weightlifters.** *International Journal of Sport Psychology*, 1970, Vol. 1(1), 14-21. Reports investigations on the balance stability (which is accounted through the number of balance fluctuations when keeping balance on

a mobile-equilibrium platform) and on balance reactivity (which is manifested through balance reactions's threshold of arising) in weightlifters before and after an altitudinal stay. Results indicate that altitudinal conditions improve balance reactivity and it was observed that after coming down from a mountain balance reactivity deteriorated, but stability improved. The effects of altitudinal conditions upon balance-reactivity components, i.e., reaction speed and balance fluctuation's amplitude which provokes the reaction of restoring the balance, are different as well. SLEEP & FATIGUE & DREAMS

4142. Berger, Ralph J. (U. California, Santa Cruz) **Morpheus descending.** *Psychology Today*, 1970(Jun), Vol. 4(1), 33-36, 70.—The 1st objective method of studying dreams involved the distinction between REM sleep from non-REM sleep. There is evidence the REM sleep is related to improved memory. REM sleep may serve to maintain efficient binocular coordination so that vision is not out of focus upon awakening. There is a positive linear relationship between amount of eye mobility and proportion of REM sleep in animals. In addition, people experience an improvement in binocular vision after a night's sleep. *E. J. Posavac.*

4143. Dimitrova, Svetla. **Dependence of voluntary effort upon the magnitude of the goal and the way it is set in sportsmen.** *International Journal of Sport Psychology*, 1970, Vol. 1(1), 29-33.—Studied the features of voluntary effort connected with surmounting the feeling of fatigue. Experiments with 55 Ss when doing mental and motor (speed and force) work were conducted in natural and laboratory conditions. Goals, different in their magnitude and in their way of being formulated, were set before S, the process of goal fulfillment and the quantity of the work done being traced out. Results suggest that a specific role in surmounting the difficulties connected with going through fatigue is played by goal reflex and by the relation between goal-reflex activity and the operant image which is leading the performance. Operant image effectiveness in overcoming the difficulties connected with the feeling of fatigue depends on the situation of the image with rich informational contents, the self-evaluation of S's own capacities being an important part of it. (French summary)—*Journal summary.*

4144. Donnell, Julie M. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego Calif.) **Performance decrement as a function of total sleep loss and task duration.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 711-714.—To determine the effect of task duration and its sensitivity to total sleep loss, measures of speed and accuracy on the Wilkinson addition test were obtained from 11 Navy enlisted men for 4 base-line days and 2 days without sleep. The number of additions attempted decreased significantly from the base-line level after 10 min. of testing on the 1st deprivation day, and after 6 min. on the 2nd day. 50 min. of testing were required to detect a significant decrease in accuracy from base line on the 1st deprivation day, while 10 min. were required on the 2nd day.—*Journal abstract.*

4145. Dreistadt, Roy. (New School for Social Research) **An analysis of how dreams are used in creative behavior.** *Psychology*, 1971(Feb), Vol. 8(1), 24-50.—It is shown that the 4 stages of creativity—preparation, incubation, illumination, and verification—described by Wallas help to explain also how creative work can occur in dreams. Famous creative dreams of artists, scientists, philosophers, and inventors are analyzed and classified as to whether they were used literally or analogically in creative work. It was found that artists such as writers of novels and plays, poets, musical composers, and painters use their dreams literally in their creative work. Scientists, philosophers, and inventors use their dreams either literally or analogically to solve their problems. Further analysis and classification is included. A general theory of dreams is postulated that relates creative dreams to ordinary dreams and which is a unification of the dream theories of Freud, Jung, and Adler. (24 ref.)—J. A. Blazer.

4146. Krippner, Stanley & Ullman, Montague. (Maimonides Medical Center, Brooklyn, N.Y.) **Telepathic perception in the dream state: Confirmatory study using EEG-EOG monitoring techniques.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 915-918.—S, a male psychologist selected on the basis of his successful performance in a previous telepathy-dream study, spent 8 nights in a laboratory; his sleep was monitored by EEG-electro-oculogram techniques. As E observed the onset of a REM period, he signalled (by buzzer) an acoustically isolated psychologist to awaken and concentrate on a randomly selected target (art print), the content of which was unknown to S or E. At the termination of each REM period, E awakened S, eliciting a dream report. These reports, and S's associations to them, were tape recorded and subsequently transcribed. The hypothesis stated that there would be a discernible correspondence between the target used on any given night and S's dreams on that night. Upon completion of the 8 nights, 3 judges (working independently and blind) rated each of the 8 targets against each of the 8 dream transcripts, using a 100-point scale to indicate degree of correspondence between each target-transcript pair. A Latin-square analysis of variance procedure compared the mean ratings of the 8 critical pairs with the mean ratings of the 56 noncritical pairs. A frequency of 6.43 (7/28 df) was obtained ($p < .001$), confirming the telepathy hypothesis and replicating a previous telepathy-dream study. *Journal abstract.*

4147. Snyder, Frederick. (National Inst. of Mental Health, Bethesda, Md.) **The physiology of dreaming.** *Behavioral Science*, 1971(Jan), Vol. 16(1), 31-44.—Presents a critical examination of evidence concerning the physiological basis of dreaming. Reviewing accumulated knowledge about the REM state, the hazards of inference across species from the highly revealing neurophysiological observations possible in lower animals to the only available source of information about the subjective experience of dreaming, i.e., human introspection, are emphasized. It is suggested that that gulf might be narrowed if more of the same findings obtained in laboratory cats could be extended to higher primates, where the surface manifestations of REM are almost indistinguishable from those of humans. The complex chain of inference involved in any psychophysiological hypothesis about dreaming even within the

realm of human studies is discussed. Considering the inherent limitations of applicable methods, physiological understanding of dreaming can only be presumptive. It is concluded that the unique bodily condition of the REM state probably is a necessary physical basis for dreaming while by no means is it sufficient explanation. (4 p. ref.)—*Journal abstract.*

4148. Van de Castle, R. L. (U. Virginia, Medical School, Sleep & Dream Lab.) **His, hers and the children's.** *Psychology Today*, 1970(Jun), Vol. 4(1), 37-39.—Analyses of the dreams of 500 male and 500 female college students revealed definite differences between the dreams of the sexes. In addition, the content of women's dreams changed during pregnancy and during menstruation. The dreams of children changed in character with age: the younger the child, the more he reported dreams of animals. "These and other findings suggest that our dream experiences do in fact reflect our personalities."—E. J. Posavac.

HYPNOSIS & SUGGESTIBILITY

4149. Barber, Theodore X. (Medfield State Hosp. & Foundation, Harding, Mass.) **Who believes in hypnosis?** *Psychology Today*, 1970(Jul), Vol. 4(2), 20-27, 84.—There is almost no scientific evidence for the existence of the hypnotic state. Besides there being no physiological measures defining hypnosis, many of the feats performed by individuals under hypnosis can be reproduced by nonhypnotized people. If appropriate suggestions are made, nonhypnotized Ss can experience hallucinations, regression, and reduction in pain and have been successfully treated for warts. "Since the concept 'hypnosis' can be used to explain every conceivable experimental finding, it is questionable whether it explains anything at all."—E. J. Posavac.

4151. Goebel, Ronald A. & Stewart, Charles G. (Williams Air Force Base, Human Resources Lab., Ariz.) **Effects of experimenter bias and induced subject expectancy on hypnotic susceptibility.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 263-272.—Screened 108 male undergraduates in groups of 4 or fewer using the Harvard Group Scale of Hypnotic Susceptibility. Attempts to influence susceptibility scores (2 objective O scorings and 2 self-scores) via E bias (role playing combined with E expectancy), E status, and S belief (information to Ss about their likelihood of being hypnotized) failed to yield statistical significance, except in 1 case. E bias was significant at the .05 level in only 1 of the 4 3-way analyses of variance needed to analyze the 4 duplicate susceptibility scorings. This result accords with an insufficiency of evidence for important E bias effects in hypnotic research. The research significance of any very small E bias effect that may have occurred in this study is discussed in light of the minute strength of relationship, or percentage of variance accounted for by each source of variation. (25 ref.)—*Journal abstract.*

4152. Graham, Charles. (Inst. of the Pennsylvania Hosp., Philadelphia) **On the mechanism of suggested suppression of myopia: Relationship to relative accommodation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 779-780.—As part of a continuing investigation of the

positive effects of suggestion on myopic visual acuity, changes in relative accommodation were concurrently assessed using the recently developed laser scintillation technique. Ss were 5 college-age volunteers. Results indicate that while in some cases acuity improved through suggestions given during hypnosis, the changes observed in the refractive power of the eye were neither large nor consistent enough to provide an adequate explanation of the phenomenon. It is possible, therefore, that the mechanism involved is at the retinal or more central neural levels, i.e., in the physiological or perceptual representations.—*Author abstract.*

4153. Kihlstrom, John F. & Evans, Frederick J. (Inst. of the Pennsylvania Hosp., Philadelphia) **Posthypnotic amnesia as disorganized retrieval.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 775-776.—Cognitive disorganization rather than functional ablation appears to characterize posthypnotic amnesia phenomenologically. Standardized hypnosis scales, including suggested posthypnotic amnesia, were administered to 168 Ss. The rank-order correlation between order of item administration and order of recall was calculated for each S. Insusceptible Ss recalled items in sequence. Hypnotizable Ss with partial posthypnotic amnesia recalled the events of hypnosis in random, incorrect order. Disorganized retrieval covaried significantly with 2 other defining characteristics of amnesia: limited recall and reversibility. Disorganized retrieval provides a method for evaluating the effects of suggested amnesia as well as other cognitive aspects of human memory.—*Author abstract.*

4154. Maslach, Christina; Marshall, Gary, & Zimbardo, Philip. (Stanford U.) **Hypnotic control of complex skin temperature.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 777-778.—Hypnotized Ss trained in internal control demonstrated modification of their autonomic nervous system by simultaneously changing the skin temperature of their 2 hands in opposite directions. Because this control was achieved under constant environmental conditions and without external reinforcers or performance feedback, cognitive processes are assumed to be the mediating factor. Waking control Ss instructed to perform the same alteration in skin temperature were unable to do so. A mean difference of 4° C between the temperature of the 2 hands was achieved by the hypnotized Ss, while the largest mean difference in the suggested direction for the controls was only .4° C.—*Author abstract.*

MOTIVATION & EMOTION

4156. Antonelli, Ferruccio. (Central School of Sport, Rome, Italy) **Psychological problems of top-level athletes.** *International Journal of Sport Psychology*, 1970, Vol. 1(1), 34-39.—Distinguished 3 categories of sportsmen: people who practice sport for more rapid social and economic promotion, and people who practice sport professionally, or at least as their main activity. According to the concept of motivational plasticity, each

category has different and characteristic motivations. The characteristic motivations of athletes are: (a) the need to be at the top, exaggerated self-esteem; (b) strong desire for self-assertion; and (c) advanced aggressive tendencies.—*Journal summary.*

4157. Coren, Stanley & Schulman, Martin A. (New School for Social Research) **Effect of an external stress on commonality of verbal associates.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 328-330.—Tested the effect of an external stress upon the commonality of verbal association responses. 135 undergraduates were tested under high test anxiety and 134 under low test anxiety. The stimuli were 15 words selected from the D. Palermo and J. Jenkins word association norms. More common associative responses were emitted by the highly stressed group.—*Journal abstract.*

4158. Czigler, István; Strasser, Judit; Nagy, Csilla L. & Barkóczi, Ilona. (Eötvös Loránd U., Budapest, Hungary) **A komplexitás-preferencia és az aktivációs alapszint összefüggéseinek vizsgálata.** [Examination of correlations between complexity preference and arousal level.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 216-223.—An inverted U type relationship was found between arousal level, as measured by the GSR, and complexity preference. (24 ref.)—*M. Moore.*

4159. Gibson, Richard S. (U.S. Naval Aerospace Medical Research Lab., Pensacola, Fla.) **Influence of physical threat stress on perceptual psychomotor performance.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 587-588.—90 male naval officer candidates were run in a 3 × 3 factorial experiment using a complex perceptual psychomotor task. The experiment investigated the hypothesis that an S's performance would be adversely influenced by both the temporal proximity and the frequency of occurrence of a physical threat. An avoidable electric shock was used as the physical threat. The proximity of the physical threat was a function of the time allowed for a shock avoidance response: 4, 3, or 2 sec. The threat of shock could occur 6, 12, or 18 times during the experiment. The results were in the direction predicted.—*Author abstract.*

4160. Glass, David C., Reim, Bruce, & Singer, Jerome E. (Russell Sage Foundation, New York, N.Y.) **Behavioral consequences of adaptation to controllable and uncontrollable noise.** *Journal of Experimental Social Psychology*, 1971(Mar), Vol. 7(2), 244-257.—Investigated the behavioral consequences of adaptation to high-intensity aperiodic noise, under conditions where Ss believed or did not believe they had indirect control over termination of the noise. Findings with 47 undergraduate males show that the work of adapting to uncontrollable, in contrast to controllable, noise resulted in heightened overall tension (tonic skin conductance) and impaired performance efficiency after termination of all the noise. Several theoretical explanations of these results are discussed, including interruption-based helplessness. The relationship of the present experiment to previous noise research is considered.—*Journal abstract.*

4161. Hatász, László. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **Irodalmi művek hatásmechanizmusának kísérleti kutatása.** [Experimental research into the effect mechanism of literary works.] *Pszichológiai Tanulmányok*, 1968, No. 11, 411-427. Compared the effect of 3 poems that differed regarding familiarity and style on 50 secondary school

pupils and intellectuals. While no significant difference was found in GSR by exposing the poem and by the direct development of set for getting down to the task, GSRs accompanying the reading of poetic works differed markedly. No significant difference was found between pupils for whom the poems represented different levels of familiarity or who differed in their ability to grasp the ideas expressed by the poem. Neither was there any significant difference between the GSR of pupils and adult intellectuals. Verbal responses as to the liking of different poems showed that pupils like the classical poems significantly better than the other 2 kinds, but no significant differences in this respect could be established in the adult group. No direct correlation between GSR and verbal reactions computed. Nevertheless, an analogous trend was noted in favor of the classical poem. It appears that depending on the gradual discovery of the structure in a literary work, the reader is enabled to grasp its complexity, and this will considerably increase the influence it has on arousal level. On the basis of the comparison of poems originated in 3 succeeding periods of history, it may be assumed that evolution in the culture of poetry is associated with the sensibilization of psychophysiological structures. (Russian summary)—*English summary*.

4162. Morris, Richard J. (Arizona State U.) **Factors associated with the demonstration of experimentally induced repression.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 447-448.—Attempted to determine the affect of such nonpersonality factors as the intensity of the aversive stimulus and the type of stimulus contingency on the occurrence of experimentally induced repression. Results show that both the stimulus intensity level and the contingent as opposed to the noncontingent use of the aversive stimulus are important factors in effecting experimental repression. Findings are discussed in terms of their consistency with the punishment literature and are explained in terms of a learning theory position.—*Author abstract*.

4163. Murray, David C. (Veterans Administration, Syracuse, N.Y.) **Talk, silence and anxiety.** *Psychological Bulletin*, 1971(Apr), Vol. 75(4), 244-260. Reviews articles relating anxiety and verbal productivity. Studies are grouped into those in which anxiety is manipulated by varying environmental stress (situational anxiety), measured by choosing Ss differing in vulnerability to stress (dispositional anxiety), or by ongoing variations in speech disturbances or physiological indexes (concurrent anxiety). There is a strong tendency for verbal quantity to be positively related to dispositional and concurrent anxiety, but negatively related to situational anxiety. Silence tends to be related negatively to dispositional, but positively to situational and concurrent anxiety. These results, plus studies showing verbal quantity 1st rising and then falling as stress increases, appear to indicate a U-curve relationship between anxiety and verbal productivity. (61 ref.)—*Journal abstract*.

4164. Roedelstein, Jon E. (Arizona State U.) **Auditory stimulation and cartoon ratings.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 772.—Reports 2 experiments (6 Ss in each) on humor, using tone as a negative reinforcer. Results support an escape, but not avoidance, conditioning procedure, and a concern for reinforcement taxonomy, i.e., what types of stimuli are negatively and positively reinforcing.—*P. Hertzberg*.

4165. Ryan, E. Dean. (U. California, Davis) **The cathartic effect of vigorous motor activity on aggressive behavior.** *Research Quarterly*, 1970(Dec), Vol. 41(4), 542-551.—Each of 120 male undergraduates was randomly assigned to a 3 × 4 factorial design, with 10 Ss in each cell. There were 3 arousal conditions, and 4 "cathartic" conditions. 1/3 of the Ss were not angered, while the other 2/3 were angered by an accomplice of the E. All Ss then had an opportunity to participate in 1 of 4 cathartic conditions: sitting, pounding, competing and winning, and competing and losing. Ss were given a socially sanctioned opportunity to deliver electric shock. 1/2 of the angered Ss 1st shocked the accomplice who had angered them, then shocked an "innocent" bystander. The other 1/2 1st shocked the bystander, then shocked the person who had angered them. There were significant cathartic effects, with no difference between sit and pound, but significant differences between the 2 competitive situations with the compete-win resulting in less aggression. There were also significant differences between the arousal conditions. The accomplice who did the angering always received the greatest amount of shock, regardless of when he was shocked or the cathartic condition. (20 ref.)—*Journal abstract*.

4166. Walbel, Henry & Thompson, Richard W. (Western Washington State Coll.) **The effects of instructions, fixed rate of presentation, and complexity on free looking time.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 377-378.—Examined the effect of stimulus complexity prior experience with a short or long fixed rate of presentation (FRP), and S's knowledge concerning the purpose of the experiment on free looking time (FLT). Results with 28 undergraduates indicate that under all conditions, Ss viewed complex stimuli longer than simple. A long FRP produced longer FLT than did a short FRP for Ss uninformed of the purpose of the experiment, but FRP had no effect on FLT for Ss who were informed.—*Journal abstract*.

ATTENTION & EXPECTANCY & SET

4167. Adelman, David & Smith, Edward E. (Duke U.) **Expectancy as a determinant of functional units in perceptual recognition.** *Cognitive Psychology*, 1971(Jan), Vol. 2(1), 117-129. This experiment provides support for (a) the hypothesis of Gibson, et al., that either an individual letter or a spelling pattern (i.e., a cluster of graphemes in a given linguistic environment which has an invariant pronunciation according to the rules of English) can serve as a functional unit in the tachistoscopic recognition of letter strings, and (b) Neisser's hypothesis that S's expectancy determines which 1 of these functional units is used. On each of 16 trials a letter string was presented tachistoscopically followed immediately by a 2-choice recognition test of 1 of the letters. On the 1st 14 trials 1/2 the Ss expected and received letter strings containing spelling patterns (SPs) while the remaining Ss expected and received letter strings containing only unrelated letters. The former group of Ss performed significantly better than the latter group on these 14 trials. On Trial 15 S's expectancy was again confirmed but on Trial 16 S was presented with a letter string from the unexpected class (SPs or unrelated letters). The results from the last 2 trials showed that letter strings containing SPs were recognized more accurately than unrelated letters when S expected SPs

but not when he expected unrelated letters.—*Journal abstract.*

4168. Ellingstad, V. S. & Heimstra, N. W. (U. South Dakota) **Performance changes during the sustained operation of a complex psychomotor task.** *Ergonomics*, 1970(Nov), Vol. 13(6), 693-705.—Exposed 15 male 21-26 yr. old graduate and medical students to a primary tracking task and a variety of subsidiary tasks for a total of 15 hr. Tracking performance was assessed through the use of 2 error measures, amount of time off the target track, and number of times off target. Subsidiary performance tasks included: a vigilance task, 2 RT tasks, mental multiplication, and digit span. In addition, 3 physiological measures were obtained. A significant decrement in tracking performance was obtained for both measures utilized. This decrement was not particularly abrupt, but occurred cumulatively over the entire course of the experiment. There was no clearly established performance decrement on the subsidiary tasks utilized. A marked variability in performance over the course of the experimental session was characteristic of performance on these tasks. Performance on the vigilance task, and 1 of the RT tasks improved during the 15-hr test session. 17-ketosteroid and 17-hydroxycorticoid values increased during the session but only in the case of the latter was the increase significant. The eosinophil count of Ss exposed to the test conditions decreased steadily throughout the experimental session. However, eosinophil measures obtained from control Ss increased during a similar time period. (French & German summaries)—*Journal abstract.*

4170. Jacobs, Paul D. & Kirk, Roger E. (U. Oklahoma) **Effects of "task-related stress" on human performance on a two-component monitoring task.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 815-823.—18 male and 18 female undergraduates performed a 2-component monitoring task under 3 conditions of stress: no-stress, task-related stress, and task-unrelated stress. Dependent variables were RT, cumulative responses, and cumulative response errors. Results indicate faster RT under conditions of task-related stress than during the other 2 conditions. Differences in cumulative responses and cumulative response errors also occurred over monitoring periods, suggesting improved vigilance with practice. Results are interpreted as indicative of a "protective-adaptive" response to stress, during which S protects himself by adapting within his response repertoire to stressors. 4171. Pask, Gordon. (Systems Research Inc., Richmond, Va.) **Metod izucheniya flyuktuatsii vnimaniya i ego raspredeleniya pri podderzhanii na postoyannom urovne éffektivnosti dostizheniya tseli.** [Method for studying the fluctuation of attention and its distribution when the effectiveness of goal-achievement is held at a constant level.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA. Vol. 44:4609) 200-205.—Describes the method which allows the experimental reproduction of conditions of constancy, and examines some of the results of experiments employing the method. Interest is focused on the influence upon performance of different, randomly given instructions of distracting character, where Ss were required to attend to the task of making certain

goal-directed types of responses to relevant stimuli embedded in a background of irrelevant stimuli. (English summary)—*I. D. London.*

4172. Saito, K., Haidenthaler, A., & Auerswald, W. (U. Vienna, Psychological Inst., Austria) **Zur frage der Beeinflussbarkeit der "Target Aiming Function" (TAF) durch eine mittels experimenteller Kinetose ausgelöste vegetative Imbalance.** [The influence of target aiming function (TAF) through an experimentally kinetosis-induced vegetative imbalance.] *Ergonomics*, 1970(Nov), Vol. 13(6), 743-748.—Subsequent to an experimentally induced kinetosis, the performance of 10 healthy male Ss in Takakuwa's Target Aiming Function (TAF) test was investigated. This test is considered to give a measure of the S's ability to concentrate. While the kinetosis caused a significant alteration of vegetative equilibrium, as indicated by a cold pressure test, the TAF test's results remained unchanged. The significance of this observation is discussed. It would appear that the TAF Test—otherwise responsive to various forms of stress—remains unaffected by the exposure of the organism to stresses which cause a chiefly vagotonic vegetative imbalance. 4173. Shaffer, L. H. (U. Exeter, England) **Attention in transcription skill.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 107-112. Compared 2 viewpoints of attention: 1 assumes restrictions in a central processor, and the other restrictions on simultaneous activity in networks of processes. The distinction between central and distributed processing may not be strongly testable but the distinction between simultaneous and consecutive processing, for different processing functions, is. An analysis of data from a study on learning to type (N = 30 Ss) shows very clearly that simultaneous processing of stimulus input and response output is possible. (23 ref.)—*Journal abstract.*

MOTOR PERFORMANCE

4174. Cain, William S. & Stevens, Joseph C. (John B. Pierce Foundation Lab., New Haven, Conn.) **Effort in sustained and phasic handgrip contractions.** *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 52-65. Ss (N = 12 males in Exp. I, and 19 males in Exp. II) maintained handgrip contractions over time at constant levels of perceived effort. The resulting functions relating force to time were similar in overall shape from person to person and highly reliable for any given person. The reduction in exerted force over time was well described by an equation that comprises 2 exponential terms; the rate parameters of both terms are independent of the initial force of contraction. Prior fatigue, as generated by sustained constant-effort contractions, increased the perceived intensity of phasic contractions. The psychophysical power law described the perceived intensity of phasic contractions both before and after the exertion of fatiguing contractions. Fatigue had little effect on the size of the exponent.—*Journal abstract.*

4175. Epuran, Mihai. **La monographie psychologique des sports conditions méthodologique pour l'introduction des épreuves psychométriques dans le sport.** [Psychological monograph on methodological sports conditions for the introduction of psychometric evaluations in sports.] *International Journal of Sport Psychology*, 1970, Vol. 1(1), 40-47. To know the main characteristics and peculiarities of each sport is indis-

pensable for conducting coaching scientifically. Psychological selection or assistance of sportsmen can only be achieved on the basis of objective data concerning the sportsmen's qualities (aptitudes) and the demands made on them by a specific activity. Suggested is a monograph, designed to record the essential features of the motor acts, the main psychophysiological demands on the sportsmen, the required aptitudes, the peculiarities of the manifestation of the various psychic functions, and the characteristics of the social relations and attitudes, etc.—*English summary.*

4176. Jones, R. Wayne & Tallarico, Robert B. (Georgia State U.) **Effects of rigidity and anxiety on pursuit rotor performance.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 227-232.—Rigidity has been linked to reactive inhibition and manifest anxiety to drive. The possible influence of these personality factors and their interaction on pursuit-rotor performance was investigated using undergraduates. High- and low-rigid Ss were divided further into high- and low-anxious Ss (n 's = 15). All Ss received 20 distributed (20-sec work, 30-sec rest) acquisition trials immediately followed by 30 relatively massed trials (20-sec work, 5-sec rest). The trend analyses showed ($p = .01$) that performance was a function of the difference between anxiety levels, with neither rigidity nor the interaction components approaching statistical significance. Low-anxious Ss were immediately superior in acquiring the skill and in maintaining it under massed conditions. (15 ref.)—*Journal abstract.*

4178. Lurcat, L. (U. Paris, France) **L'activité graphique des deux mains: Control visuel et control kinesthésique.** [Graphic activity with both hands: Visual and kinesthetic control.] *Revue de Psychologie Appliquée*, 1970, Vol. 20(3), 165-179.—Reports results of continuing research on visual control of manually reproducing connected cycloids. Performance is related to handedness, types of curves, direction of motion, age of Ss, and their grade in school. Restraints are reported between perception and kinesthetics, between left and right hand, and between directions of the hand movement. The study sought to determine the difficulties which prevent some children from acquiring writing skills.—K. J. Hartman.

4179. MacKay, Donald G. (U. California, Los Angeles) **Stress pre-entry in motor systems.** *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 35-51.—Stress preentry is the occurrence, before it is due, of the stressed component in a series of rapidly produced movements. For 22 right-handed Scottish undergraduates, the phenomenon appeared in speech (experimentally produced spoonerisms) and in patterns of

finger movement: serial-order errors were usually a stressed element entering before its time. The probability of serial-order errors was also found to increase as a function of rate of action. Several explanations are possible, but the model that best fits the data is one of a scanning device for determining serial order of rapidly produced behavior. (29 ref.)—*Journal abstract.*

4180. Semjén, András. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **Az Ingerminta módosulásának hatása ritmikus mozgások újrászerveződésére.** [Effect of modification in the stimulus pattern on the reorganization of rhythmic movements.] *Pszichológiai Tanulmányok*, 1968, No. 11, 45-62.—Examined factors bearing on the reorganization of rhythmic movements, and on establishing the "cohesion" of such movements in situations of synchronization. To assess the cohesion of the rhythmic action series, the inhibitability of the individual factors in the series was measured. New data indicating the basic association of certain sensorimotor unit-formations with particular time constants have been found. Movements succeeding one another in short intervals are more closely related than those separated by longer intervals. The relevance of the time factor appeared also in other respects, i.e., it was impossible to keep cohesion constant when the action series was prolonged ad lib. Such an experimental setting led to the formation of substructures within the main structure. This aspect of the time factor may be classed as a positional effect. However, positional effects may play a more general role. The internal constituents of the structure represent points of reference for the succeeding factors, but not for the last factor. The synchronizational achievement in inhibiting 1 of the constituents in the action series while the stimulus pattern is unchanged may be determined by the circumstance that only stimuli surrounded by time intervals of considerable length preserve their full reference value. It is a decisive factor in adapting to a new structure whether or not the temporal pattern of the new structure may be classed as "good form." Some hypotheses are suggested concerning the attitudes which the Ss faced with the task might take. (Russian summary)—*English summary.*

4181. Smith, Karl U. & Schappe, Robert. (U. Wisconsin, Behavioral Cybernetics Lab.) **Feedback analysis of the movement mechanisms of handwriting.** *Journal of Experimental Education*, 1970(Sum), Vol. 38(4), 61-68.—To extend the feedback analysis of legibility in handwriting, a coordinate force transducer has been devised that makes possible the separate sensing of the right-left and near-far directions of writing motions and the converting of these movements to their electrical analogs. This method of transducing handwriting motions made possible systematic measurement of the effects of feedback displacement and delay of the visual feedback of writing movements and of analyzing the types of variation in legibility related to variable feedback factors. 2 experiments are described with 13 right-handed female and 5 left-handed male graduate and undergraduate Ss. Results show that differential directional defects and general disturbances in legibility and timing of writing movements occurred in relation to both visual feedback displacement and delay of writing motions. The findings gave added support to the view that writing is not a form of discrete stimulus-response behavior or stimulus tracking, but consists of self-generated forms of response comparable to steering, in

which accuracy, legibility, and learning are directly determined by feedback time factors and directional specificity of particular right-left and near-far coordinates of movement that dynamically control and project visual input in the writing act. *Journal abstract*

4182. Varjasi, Edit. (Eötvös Loránd U., Budapest, Hungary) **Teljesítmény-ekvivalencia és a kinezetikus érzéklet tükröző funkciója.** [Achievement equivalence and the mirroring function of kinaesthesia.] *Psichológiai Tanulmányok*, 1968, No. 11, 83-96.—Achievement equivalence stands for identical environmental changes produced by widely different effectors of the motor apparatus. The achievement equivalence of the arm and leg was examined experimentally. The achievement consisted of pushing an object from 1 place to another, with distance and direction being well defined. The special role of feedback which appeared to be a function of the character of kinesthetic perception was shown. 1 of the basic conditions of achievement equivalence is the kinesthetic perception signaling the movement of the object. This assumption is supported in another phase of the experiment. (Russian summary)—*English summary*.

4183. Whitley, Jim D. (U. California, Riverside) **Effects of practice distribution on learning a fine motor task.** *Research Quarterly*, 1970(Dec), Vol. 41(4), 576-583. 60 college men were given 35 trials of either distributed practice (DP) or massed practice (MP) ($N = 30$ group) on a fine motor learning task foot tracking. The study was designed to make a direct comparison between the 2 groups of the amount learned. While learning was significant for both groups, there was no difference in the amount learned between groups. As expected, performance was significantly better under DP; this was attributed to the temporary depressant effects of reactive inhibition resulting from MP. Results support the findings of recent learning studies on gross motor tasks; almost without exception they reported that practice distribution affected performance but not learning. Thus, the traditionally accepted belief that DP is superior to MP in motor learning is not supported by experimental evidence. These findings present practical implications for motor learning in terms of efficiency in the use of practice time. (24 ref.)—*Journal abstract*

4184. Whitley, Jim D. & Allan, Lawrence G. (U. California, Riverside) **A test of activation as a general factor in strength performance.** *Research Quarterly*, 1970(Dec), Vol. 41(4), 584-588. Tests the general activation concept as it relates to strength performance. No difference in grip strength was found between Ss who performed maximal leg strength exercises between grip trials (in an attempt to raise their level of activation through induced muscular tension), and controls who read between grip trials. Ss were 70 male undergraduates who alternated between experimental and control conditions in groups of 35. Also, there was no difference in grip strength performance over trials for both groups. Intercorrelations of strength scores between limbs for the experimental group showed more specificity than generalizability. While these results fail to support a generalized activation effect in the static strength performance context, they do provide additional evidence of neuromuscular specificity in motor ability. *Journal abstract*

Canadian Journal of Psychology, 1970(Oct), Vol. 24(5), 305-310—Describes an apparatus that permits the measurement of simple RT to temperatures applied to the skin. 3 above-normal temperatures and 3 below-normal skin temperatures were used. The RT to touch was also obtained. Ss were 6 male and 6 female undergraduates. RT to cold was significantly faster at each temperature than RT to warm. The relevance of these results to contemporary theory of thermal sensitivity is discussed. (French summary)—*Journal abstract*

4186. Girardin, Y., Montpetit, R., & Manceau, J. N. (U. Montreal, Quebec, Canada) **Mesure du temps de réaction simple à l'aide de compteurs manuels.** [Measure of simple reaction time with the aid of digital computers.] *International Journal of Sport Psychology*, 1970, Vol. 1(1), 22-28—Compared a simple stopwatch device with a conventional electric timer. Simple RT to an auditory stimulus was the parameter studied. Inter-individual differences, order of presentation of the instruments, effect of an intervening day between the testing sessions, and the difference between the apparatus were the possible sources of variance. The variance attributed to the instruments explained 13.6% of the total variance. It is concluded that the new mechanical device could be used to test simple RT. *English summary*

4187. Kamlet, Arthur S. & Bolsvert, Lawrence J. (Bell Telephone Lab., Whippany, N.J.) **Reaction time: A bibliography with abstracts.** Aberdeen Proving Ground, Md.: Aberdeen Research & Development Center, U.S. Army Human Engineering Laboratories, 1969 iii, 168 p.

4188. LaBerge, David. (U. Minnesota) **On the processing of simple visual and auditory stimuli at distinct levels.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 331-334—Explored the possibility that identification of a single stimulus can take place through more than 1 perceptual route. In Exp. I with 5 undergraduates, mean RT to color was systematically changed by varying type of catch stimulus. In Exp. II with 3 Ss, the form of the RT distribution to a tone was changed by varying type of catch stimulus. Considerations of distribution means and shapes led to the conclusion that detection and discrimination are 2 of the alternative levels of perceptual processing which can be evoked in rapid identification of these stimuli. (15 ref.)—*Journal abstract*

4189. Semjen, András. (Hungarian Academy of Sciences, Psychology Inst., Budapest) **A pszichológiai refrakter periódus: módszerek és elméletek.** [Psychological refractory period: Methods and theories.] *Psichológiai Tanulmányok*, 1970, Vol. 12, 61-84. Discusses the performance of the human operator in a serial reaction situation. Analyzing stimulus parameters and experimental situations determining a "psychological refractory period" have been the main forms of laboratory investigation. Typical experimental methods and major theories, i.e. the "expectancy" and "preparedness" hypothesis of a single-channel decision system, are discussed and it is inferred that these principles are mutually complementing rather than mutually excluding. The single-channel decision hypothesis is criticized since, although endeavoring to attain precise quantitative predictions, it disregards not only the mechanisms underlying performance but sometimes even the actual characteristics of the experimental setting. It is assumed that, if the intermittent activity of the human operator is

4185. Corson, James H. & Crannell, C. W. **Simple reaction time to cutaneous temperature stimuli.**

concerned with specific forms of attention, the activities may come into play either in the organization or stabilization of the stimulus pattern, in response-selection, or in response execution and control (Russian summary) (50 ref.).—*English summary.*

4190. van Assen, A. & Eijkman, E. G. (U. Nijmegen, Netherlands) **Reaction time and performance in learning a two dimensional compensatory tracking task.** *Ergonomics*, 1970(Nov), Vol. 13(6), 707-717.—Describes a series of experiments consisting of discontinuous step function tracking in 2 dimensions. Ss had to compensate for a stepwise deflection of a spot on a CRT by means of 2 knobs, 1 controlling the horizontal, and the other the vertical movement of the spot. 3 different learning phenomena in step function compensation tracking were distinguished. 2 stages were recognized in the processing of incoming signals: 1st the classification of the signals by an analyzing mechanism, and 2nd the formation and direction of a trigger signal by a mechanism. The processing time required by these 2 mechanisms constituted the latency of the compensatory response or RT. As a result of the processing, a trigger signal set off a programed response. The program improved with practice, and this is demonstrated by means of a measure called "quality of the response" (French & German summaries)—*Journal abstract.*

LEARNING

4191. Berch, Daniel B. (California State Coll., Los Angeles) **Comments on Biederman's "Continuity Theory Revisited: A Failure in a Basic Assumption."** *Psychological Review*, 1971(May), Vol. 78(3), 260-261.

Discusses the argument of G. Biederman (see PA, Vol. 44, 11751) that a basic assumption of K. Spence's discrimination learning theory is incorrect. It is suggested that one can account for Biederman's data on the basis of the stimulus generalization of habit while maintaining that the inhibition associated with the negative stimulus increases monotonically over the course of learning. It is concluded that Biederman's evidence is insufficient for rejecting Spence's theory.—*Journal abstract.*

4192. Burke, Ronald J. (York U., Toronto, Ontario, Canada) **Effects of overlearning on recall and usage of stored information.** *Canadian Journal of Psychology*, 1970(Jun), Vol. 24(3), 153-160.—Studied the influence of the strength of associative bonds on word usage. In Exp. I with 91 undergraduates in 2 groups, Ss were given 8 and 16 repetitions of the paired words, respectively. Results show no significant differences in the usage of the experimental words for the stories, although memory tests reveal differences in the degree of learning. A 2nd within-group analysis of data from 5 independent groups of undergraduates (Exp. II) used scores on memory tests to assign Ss to subgroups based on the amount of learning and overlearning of the paired words they exhibited. Again, results show no differences in word usage. The concepts of associative bonds, reinforcement, and overlearning derive from studies of learning, but seem inadequate when generalized to problem situations. Problem situations introduce a selective function that alters the dynamics of the associative process and these dynamics show considerable individual variation and stability. (French summary)—*Journal abstract.*

4193. Geisert, Paul. **A comparison of the effects of information mapped learning materials and tradi-**

tional materials on the learning of concepts via the printed page and computer cathode ray tube. *CAI Center Technical Memorandum, Florida State U.*, 1970(Oct), No. 24, 85 p.—44 members of the National Guard compared information mapped materials with traditional materials. No significant differences were found in the comparison of 15 dependent variables. Significant differences were demonstrated for all attitudes toward the materials with Ss showing more positive attitudes toward information mapped materials than traditional materials. A trend in performance and time variables suggests that information mapped feedback treatment resulted in better performance. (21 ref.).—*Journal abstract.*

4194. Hebert, John A. (Colorado State U.) **Context effects in the generalization of a successive discrimination in human subjects.** *Canadian Journal of Psychology*, 1970(Aug), Vol. 24(4), 271-275.—In a successive conditional discrimination, 16 right-handed undergraduates learned to give a "right" response to a relatively dark grey (#3) and a "left" response to a relatively light grey (#6). After reaching criterion, Ss were placed in 1 of 2 groups. 1 group was given a test series of greys which contained #3 and some yet darker greys, and the other group was given a test series including #6 and yet lighter greys. The effect of placing #3 in a relatively darker context than in training was to bring about a transposition of response from "right" to "left," and, conversely, the effect of placing #6 in a relatively lighter context than in training was to effect a transposition from "left" to "right." It was found that this transposition of response occurred gradually during testing, since it occurred very frequently in the latter part of testing but not in the initial part. (French summary)—*Journal abstract.*

4195. Hilgard, Ernest R. (Stanford U.) **A basic reference shell on learning theory.** *ERIC-Stanford, Calif., Series I*, 1967(Sep), 17 p.—Lists principles from stimulus-response, cognitive, motivation, and personality theories which may be potentially useful in practice. Approaches to practical problems via unified theory are discussed with reference to application of Guthrie's contiguous conditioning theory, Skinner's operant conditioning theory, the Miller-Dollard version of drive-reinforcement theory, and Gagne's hierarchical model. A short bibliography on learning theory and its application is included.—S. Knapp.

4196. Holding, D. H. (U. Louisville) **Repeated errors in motor learning.** *Ergonomics*, 1970(Nov), Vol. 13(6), 727-734.—Analyzed the error records of 3 groups of undergraduates (N = 54) carrying out 2 blocks of practice with the discrimination reaction timer. During the 1st block, an attempt was made to vary Ss' commitment to wrong responses by modeling the practice of the 2nd group, and the observation of the 3rd group, upon the responses of the control group. It was shown that, during the course of learning, Ss tended increasingly to repeat specific errors. Some support was found for the hypothesis that Ss learn the errors which they commit, although the contribution of early errors to the distribution of later errors was small and must be considered largely nonspecific. The method used to vary the degree of commitment had little effect. (French & German summaries)—*Journal abstract.*

comparative-psychological examination of learning.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 173-181.—2 omissions in traditional learning theory are: (a) memory functions are inadequately represented, and (b) results of animal experiments are indiscriminately applied to human learning. "An attempt is made to demonstrate the distorting effect these omissions have had on theory formation by presenting relevant experimental data derived mainly from our own research." (English & Russian summaries)—M. Moore.

4198. Marton, Magda L. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **Tanulás, vizuális-poszturális testmodell és a tudat kialakulása.** [Learning visual-postural body-model and the evolution of consciousness.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 182-198.—Presents a review of the literature on the role of motor experience in the genesis of visual perception. "An interpretation of experimental data is given, and the possible role of this central motor action event in the formation of experience-consciousness is pointed out." (English & Russian summaries) (86 ref.)—M. Moore.

4199. O'Brien, F. & Azrin, N. H. (Anna State Hosp., Ill.) **Behavioral engineering: Control of posture by informational feedback.** *Journal of Applied Behavior Analysis*, 1970(Win), Vol. 3(4), 235-240. Studied the effects of informational feedback on a socially undesirable behavior using 8 hospital employees in Exp. I and 6 in Exp. II. The feedback was a mild vibrotactile stimulus and the response was slouching. When Ss slouched, a behavioral engineering apparatus provided vibrotactile stimulation to the shoulder. All Ss slouched less when stimulation was provided. A procedural control revealed that slouching will decrease because of the informational aspect of the stimulus consequence and not because of its aversive properties. When Ss were instructed to slouch, the effects of feedback were reversed: feedback increased, rather than decreased, slouching. These results indicate that the effect of feedback for a response depends on the S's motivation to perform that response. It is suggested that informational feedback could be used more widely as a therapeutic procedure to modify human behaviors, but only those behaviors that a patient is strongly motivated to change. (25 ref.)—*Journal abstract*.

4200. Reber, Arthur S. & Millward, Richard B. (U. British Columbia, Vancouver, Canada) **Event tracking in probability learning.** *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 85-99.—After 1000 observation trials in which the event schedule followed a sawtooth wave with a period of 50 trials, Ss ($N = 20$ high school students) tracked the events very closely on periodic test trials but showed no periodic tracking on no-event or constant-probability test trials. During the early periodic-event cycles Ss' response proportions tracked the event proportions approximately as predicted by statistical learning theory, but during later cycles, their response proportions peaked and bottomed at the same points as the event proportions, a relationship nicely described by the averaging model of M. P. Friedman, E. C. Carterette, and N. H. Anderson (see PA, Vol. 43:1895). (15 ref.)—*Journal abstract*.

4201. Sampson, Jeffrey R. & Chen, I-Ngo. (U. Alberta, Edmonton, Canada) **Context effect in two-choice probability learning.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 65-66.—20 male undergraduates made 2 sets of 200 binary predictions in a standard

noncontingent probability learning paradigm. $\frac{1}{2}$ the Ss saw a series with $\pi = .6$ 1st and then a series with $\pi = .8$; the order was reversed for the other Ss. Results indicate more overshooting on the .6 series when it was preceded by the .8 series and a suggestion of less overshooting on the .8 when it was preceded by the .6. An extinction explanation is rejected in favor of a multiple-strategy hypothesis, in which S is presumed to use a strategy of guessing the more common event to approximate proportion to its degree of success.—*Journal abstract*.

4202. Seaborn, A. E. (London School of Economics, England) **Criterion of pretraining in stimulus pre-differentiation.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 1009-1010.—Pretraining in stimulus pre-differentiation studies can be controlled by equating degree of mastery achieved by different experimental groups or the learning trials given all groups. In some studies, where control has been in terms of trials, degree of mastery achieved in pretraining by different experimental groups relates positively to success achieved by them on the transfer task, obscuring the precise effect of the main experimental variables.—*Journal abstract*.

4203. Teghtsoonian, Robert & Teghtsoonian, Martha. (Smith Coll.) **Discontinuities in recognition learning revealed by critical-trial analysis.** *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 75-84. For 48 undergraduates, the number of choices required to locate a previously seen item among a group of alternatives (3-digit numbers or consonant trigrams) was found to be a discontinuous function of successive viewings. Until the critical trial—the 1st occasion on which the correct item was the S's first choice—performance was only slightly better than chance. Immediately after the critical trial, the mean number of choices moved to and remained at a sharply lower level. The discrete transition at the critical trial was concealed by conventional averaging over trials numbered from the beginning of the task but emerged clearly when averaging was performed over trials realigned with the critical trial as reference point for each item.—*Journal abstract*.

4204. Wiesen, Joel P. (King's Coll., Wilkes-Barre, Pa.) **Comment on "General shape function model of learning with applications in psychobiology."** *Psychological Review*, 1971(May), Vol. 78(3), 272-273.—Suggests that a reader of a study by D. Warburton and J. Greeno (see PA, Vol. 44:15900) is likely to form a gross misconception of the probability of forming very dissimilar groups when the randomization process is applied with small groups. This is due to a misapplication of elementary probability theory. The model they presented was, in part, justified by this erroneous approach. The other theoretical considerations motivating their analysis are not affected by this error.—*Journal abstract*.

Conditioning

4205. Furedy, John J. (U. Toronto, Ontario, Canada) **Cross-modal differentiation under identical reinforcement schedules, and UCS-intensity effects in human classical eyelid conditioning.** *Canadian Journal of Psychology*, 1971(Feb), Vol. 25(1), 7-23. Assesses cross-modal differentiation between light and tone CS with specially developed tests applied to selected trials of a 41-trial conditioning series which employed a delayed, 500-msec interstimulus interval, and an overall rein-

forcement schedule of 67%, 1-msec UCS pairings for both CS. An unpaired CS-and-UCS control group of 64 Ss indicated reliable conditioning for the 128 experimental Ss (Ss were undergraduates). There was some differentiation even for those 64 experimental Ss for whom the identity of reinforcement schedules for the CS was maintained throughout the trial series. Magnitude and frequency of CR were reliably direct functions of both between- and within-Ss variations of UCS intensity (120 or 260 V DC infraorbital shock). Emphasized was the importance of providing within-experimental differentiation tests especially for experiments where the within-Ss treatment effect fails to emerge. (French summary) (23 ref.)—*Journal abstract*.

4206. Furedy, John J. (U. Toronto, Ontario, Canada) CS and UCS intervals and orders in human automatic classical differential trace conditioning. (*Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 417-426. Measured the GSR and digital volume-pulse change in 4 groups of 80 Ss each with light and tone as CS and shock as UCS. For Groups I and II, the CS-UCS interval was .75 and 7.5 sec., respectively; for Groups III and IV, the UCS-CS interval was .75 and 7.5 sec., respectively. Group III showed "backward" differential conditioning in the GSR; Group II yielded reliable conditioning of "multiple responses" occurring before UCS onset; the magnitude and extent of conditioning was greater in Group I than in Groups II and III, which did not differ; some evidence for "reverse" conditioning was suggested in Group IV, with slightly greater responding to the CS not paired with the UCS; instructions which distracted the Ss from the CS did not affect responding to those stimuli. (French summary) (16 ref.)—*Journal abstract*.

4207. Nicki, Richard M. (U. New Brunswick, Fredericton, Canada) The reinforcing effect of uncertainty reduction on a human operant. (*Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 389-400.—Results of Exp. I and II indicate that 56 female undergraduates preferred (as indicated by key-press responses) to view a clear version of a preceding blurred object over viewing an unrelated but comparable clear object—but only when the identity of the blurred object was unknown. In Exp. III with 12 Ss, subjective uncertainty, equated to the average information formula, where N was the number of guesses as to the identity of the blurred object and p was the relative confidence placed in each guess, was found to be an inverted U-shaped function of blurredness. This finding was used in Experiment IV, with 60 Ss, to accurately predict that the number of key-presses obtaining clear versions of blurred objects would be an inverted U-shaped function of blurredness. (French summary)—*Journal abstract*.

4208. Sattler, Jerome M. (San Diego State Coll.) Verbal conditioning of common associations and need for approval. (*Journal of General Psychology*, 1971(Apr), Vol. 84(2), 281-290.—2 experiments assessed the effects of verbal reinforcement, need-for-approval, and word frequency of the stimulus words on the production of common associations. In both experiments, (total N = 140 undergraduates), the reinforcement conditions (positive, negative, and positive-negative) did not significantly differ from the control condition in affecting the response class. Need-for-approval interacted with the reinforcement conditions and with blocks of words. High frequency words elicited more common associations than low frequency words.

Sex of Ss, studied in 1 experiment, was not a significant main effect. Only 2 of the 140 Ss were aware of the reinforcement contingency. The results suggest that verbal reinforcement is not an effective means of increasing common associations. (17 ref.)—*Journal summary*.

4209. Singh, Devendra. (U. Texas) Effect of level of manifest anxiety and type of pretraining on timing behavior. (*American Journal of Psychology*, 1971(Mar), Vol. 84(1), 134-139.—High- and low-anxiety undergraduates were trained on a DRI timing schedule, either without pretraining or after facilitatory or interfering pretraining. The low-anxiety Ss performed better than the high-anxiety Ss in all 3 conditions.—*Journal abstract*.

Verbal Learning

4210. Abell, Andrew T. (Southeastern Louisiana Coll.) A test of reinforcer forms with flaps. (*Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 984-986.—Replicates an experiment in which a new group, verbal-conditioning device (reinforcer form) was used, but with a modification of the reinforcer forms. Ss were 26 male and 22 female undergraduates. The modification, involving paper flaps that conceal all symbols except those where S is working, was designed to make the experimental contingencies more analogous to the usual operant and respondent ones. Earlier results, showing the simultaneous operation of evaluative words as operant and respondent reinforcers, were confirmed.—*Journal abstract*.

4211. Guthrie, John T. Feedback and sentence learning. Center for the Study of Social Organization of Schools Report, Johns Hopkins U., 1970(Jun), No. 71, 15 p.—Presents the theoretical functions of external feedback in stimulus-response and closed-loop models of verbal learning. Contradictory predictions from the models were tested with a 3 x 3 factorial experiment including 3 types of feedback and 3 amounts of rehearsal. 90 male undergraduates were run individually and required to learn 39 sentences verbatim. Results indicate that feedback (a) facilitated learning when it followed wrong responses; (b) had no effect on learning following right responses; (c) when it consisted of both stimulus and response, was superior to no feedback, and (d) when it consisted of only the response, did not differ from no feedback. Findings are discussed in relation to the 2 learning models and programed instruction.—*Journal abstract*.

4212. Johnsen, E. Peter. (U. Rochester) The effect of organization set and interpolation on prose learning. (*Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3340.

4213. Lippman, Louis G. (Western Washington State Coll.) Compound stimuli in serial learning. (*Journal of General Psychology*, 1971(Apr), Vol. 84(2), 191-199.—Reports results of 2 experiments, in which 16 CVCs were presented (total N = 62 undergraduates), either as a series of single syllables or as 4 clusters of 4 items each. Total list acquisition was not affected when Ss learned by the anticipation method, but serial position curves revealed marked isolation effects for the initial item of each cluster. When interference effects from stimulus clustering were reduced in Exp. II through the use of a reconstruction procedure, clustered presentation was found to result in facilitated total list acquisition. These results were attributed to enhanced discriminability, in

keeping with evidence on stimulus selection.—*Journal summary.*

4214. Newsom, R. S. & Gaité, A. J. (U. Wisconsin) **Prose learning: Effects of pretesting and reduction of passage length.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 123-129.—Investigated the learning and retention of prose materials. Immediate and 1-wk retention was examined in 200 undergraduates who had either read a 2300-word passage (LP) on science fiction or a 300-word short passage (SP). The SP was derived from the information retained over a 1-wk period by Ss who read and learned the LP. Retention was assessed by a 30-item multiple-choice test based upon information in the LP. 1-way analysis of variance of posttest scores indicates that for 1-wk retention the SP was retained significantly ($p < .01$) better than the LP. There was no significant difference on immediate retention. Results are discussed in terms of current cognitive learning theory, prose-learning paradigms, and classroom procedures related to the presentation of new material. (17 ref.)—*Journal abstract.*

4215. Paivio, Allan & Madigan, Stephen A. (U. Western Ontario, London, Canada) **Noun imagery and frequency in paired-associate and free-recall learning.** *Canadian Journal of Psychology*, 1970(Oct), Vol. 24(5), 353-361.—Investigates the effects of rated imagery (I) and Thorndike-Lorge frequency (F) of nouns in paired-associate (PA) and free-recall (FR) learning. In the PA task, I and F were factorially varied on the stimulus and response sides of 16-pair mixed lists. Ss (77 male high school graduates) had 4 PA study and recall trials with each of 2 such lists. In agreement with previous findings, I was strongly related to learning, more so on the stimulus than on the response side of pairs. Weaker effects of F were positive on the response side but negative on the stimulus side under certain combinations of stimulus and response I revealed by interaction effects. The FR task involved factorial variation of I and F in 32-item lists. 52 undergraduates were presented 10 trials with 2 such lists. Recall was consistently better for high-I than for low-I nouns. Frequency had a consistent positive effect when the nouns were high in I, but its effect was negative on early trials when the nouns were abstract. I and F therefore were clearly differentiated empirically in both tasks. Findings are discussed in terms of such factors as stimulus-evoked mediating imagery and response availability. (French summary) (21 ref.)—*Journal abstract.*

4216. Wallace, William P. & Nappe, Gary W. (U. Nevada) **Verbal-discrimination learning following a free-recall familiarization training procedure.** *Canadian Journal of Psychology*, 1970(Feb), Vol. 24(1), 27-33.—Investigated the effects of transfer from a modified free-recall task to verbal-discrimination (VD) learning. The free-recall procedure was designed to impact increments in experimental frequency to specific words that appeared in VD. 4 experimental groups, with 30 undergraduates in each, were given prior free-recall exposure to either all right VD items (A-R), all wrong (A-W), both the right and wrong items from same VD pairs (B-S), or both the right and wrong items from different VD pairs (B-D). A 5th group of 30 Ss served as a control and learned a free-recall list which did not contain any VD items (C). In terms of number of correct responses during VD learning, the groups were ordered as follows: A-R, C, A-W, B-S, and B-D. Results are interpreted as being consistent with derivations from the

frequency theory of VD learning. (French summary)

Verbal Paired Associate Learning

4217. Batchelder, William H. (U. California, Irvine) **A theoretical and empirical comparison of the all-or-none multilevel theory and the mixed model.** *Journal of Mathematical Psychology*, 1971(Feb), Vol. 8(1), 82-108.—Compared 2 theories for stimulus generalization in paired-associate learning (PAL)—the mixed model and the all-or-none multilevel theory. Both theories postulate basic all-or-none learning processes but differ in their mechanism for generalization. The mixed model postulates that generalization occurs only during responding; whereas, the multilevel theory postulates that generalization occurs during learning itself. Theories were compared on PAL experiments with 154 undergraduates, involving lists composed of several duos of related items with similar Gibson form stimuli and identical responses. Interactions among related items were studied by considering the joint error-success process to both related items during learning. Both theories gave fairly adequate accounts of this joint data; however, the multilevel theory seems the more adequate. In addition to the empirical comparison of the 2 theories, several theoretical relationships are also presented. (22 ref.)—*Journal abstract.*

4218. Black, Harvey B. (Indiana U.) **Effects of overtiness of practice on learning.** *Bulletin of the School of Education, Indiana U.*, 1969(Nov), Vol. 44(6), 31-128.—Presents a series of 20 paired-associate experiments to investigate the effects upon acquisition of varying the overtiness of practice and the duration of the practice intervals. The task required the emission of practice response consisting of pressing a subset of 3 keys, selected from an array of 7 irregularly positioned keys, that was paired with each of the single letter stimulus elements. The experiments were controlled and results recorded automatically. Results reveal a relatively neutral effects assumption that the overt practice of highly overlearned verbal or simple motor responses has an essentially neutral, time-consuming effect upon acquiring associations to paired stimuli. 2 requirements for maintenance of this neutral effects assumption are presented. In contrast to the neutral effect, extension of the unfilled interstimulus intervals, and the extension of the ITI had a positive effect upon acquisition. This effect diminished under variable interval conditions imposed by making the interval duration contingent upon correctness of practice response. Under constant interval conditions the effect was most evident when the ITI was extended, and least evident when the anticipation interval was extended. Findings are discussed in terms of models that include implicit response assumptions. (45 ref.)—*Journal summary.*

4219. Boor, Myron & Harmon, John. (Milwaukee County Mental Health Center, North Div., Wis.) **Comment on Weiner's (1966) study: Role of success and failure in the learning of easy and complex tasks.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 256-257. Examined the study of B. Weiner (see PA, Vol. 40:4974) on the role of success and failure in the learning of complex and easy tasks. Although his findings seem to support the notion that an S's perception of success and failure influences performance, it is suggested that the research design is not

adequate to support his conclusion that the results obtained are evidence which is inconsistent with the Hull-Spence hypothesis, that anxiety interacts with response competition inherent in the task itself.—*Journal abstract*.

4220. Colman, Frank & Paivio, Allan. (Lakehead U., Thunder Bay, Ontario, Canada) **Pupillary dilation and mediation processes during paired-associate learning.** *Canadian Journal of Psychology*, 1970(Aug), Vol. 24(4), 261-270.—Describes 2 experiments with 54 undergraduates in which pupillary activity was continuously photographed during mediator-formation and paired-associate (PA) learning tasks involving nouns as items. Abstractness-concreteness of the nouns and mediation instructions (imagery, verbal, or none) were varied. The magnitude and latency of pupillary dilation as well as task performance were measured. The PA recall data confirm previous findings in showing strong positive effects of concreteness, especially as a stimulus variable. Learning was generally best under the imagery mediation set, its superiority over the verbal mediation condition being greatest in the case of pairs with abstract stimulus members. Pupil size during learning was largest when no mediation instructions were given and when stimulus members were abstract, supporting an interpretation of pupillary dilation as an index of cognitive task difficulty. (French summary)—*Journal abstract*.

4221. Damianopoulos, Ernest N. (U. Iowa) **Stimulus and response availability in associative learning.** *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 12-22.—A 3-stage transfer design—paired-associate (PA) task 1, free-recall learning, and PA2—was used to further assess the quantitative contribution of stimulus and response learning to the learning of paired associates. The stimulus and response items were drawn from different populations, and 2 rates of item exposure (2:2 and 4:4 sec.) were employed in the PA2 task. No specific facilitative effects due to stimulus and response learning were observed, contrary to the general conceptualization.—*Journal abstract*.

4222. Donaldson, Wayne & Glathe, Herta. (U. Pittsburgh) **Signal-detection analysis of recall and recognition memory.** *Canadian Journal of Psychology*, 1970(Feb), Vol. 24(1), 42-56.—Conducted 3 paired-associate learning studies to compare signal-detection analysis of recall and recognition memory performance. Exp. I with 80 female undergraduates, showed that (a) recall and recognition signal-detection model sensitivity measures (d' s) are substantially different in later trials, and (b) a previously suggested correction for guessing does not transform the data to theoretical expectations. Exp. II, with 45 Ss, showed that S's guessing rates change systematically over trials and further supported the inappropriateness of a guessing correction. Exp. III, with 40 Ss, attempted to hold constant the probability of guessing correctly. It is suggested that for purposes of comparing recognition and recall, a receiver-operating characteristic (ROC) analysis of recall data is inappropriate and that a better approach is the use of the forced-choice or 1-of-M-orthogonal signals model. A possible interpretation of a recall ROC d' is suggested. (French summary) (22 ref.)—*Journal summary*.

4223. Duffy, Thomas M. (U. Manitoba, Winnipeg, Canada) **Mnemonics and intra-list interference in paired-associate learning.** *Canadian Journal of Psychology*, 1971(Feb), Vol. 25(1), 33-41.—Hypothesized that mnemonics facilitate paired-associate learning by

increasing the distinctiveness of pairs thereby reducing intralist interference. Mnemonic devices were presented with pairs with intralist stimulus similarity being either high or low. Greater facilitation of learning due to mnemonic presentation was expected under high similarity. Ss were 85 male and 128 female paid volunteers. While mnemonics facilitated learning, the distinctiveness hypothesis was not supported in terms of learning rate. However, support was obtained in additional error analyses and when S report data were examined. It is concluded that mnemonics increase pair distinctiveness, but this effect is only 1 factor in mnemonic facilitation of learning. (French summary) (18 ref.)—*Journal abstract*.

4224. Martin, Edwin & Carey, Stephen T. (U. Michigan) **Retroaction, recovery, and stimulus meaningfulness in the A-B, A-Br paradigm.** *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 123-133.—Examined the role of stimulus meaningfulness in paired-associate transfer, retroaction, and recovery ($N = 96$ undergraduates). Stimulus meaningfulness did not affect performance in 2nd-list learning or in tests for retroaction in the A-B, A-Br paradigm. Relative to an A-B, C-B control paradigm, however, both transfer and retroaction were more negative with higher stimulus meaningfulness. Marginal absolute recovery was observed in the A-B, A-Br paradigm over repeated retroaction tests.—*Journal abstract*.

4225. Royer, James M. & Kulhavy, Raymond W. (U. Massachusetts) **Encoding behavior while learning: Thematically prompted paired associates.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 545-546.—Anderson and his associates have recently reported several experiments in which it was demonstrated that paired-associate learning could be facilitated by embedding the associates in thematically prompted sentences (e.g., After many months of walking, SUS develop holes.). The purpose of the present experiment was to examine the relationship between cue encoding and associative recall when the associates were embedded in sentences from the Anderson, et al., experiments. The major findings were: (a) a failure to replicate the Anderson, et al., results, which was attributed to procedural differences between the experiments; (b) a positive relationship between cue encoding and associative recall; and (c) the rather surprising result that unstable cue encodings (i.e., encodings that change over trials) were equally as facilitative to associative recall as were stable encodings.—*Author abstract*.

4226. Weiner, Bernard & Schneider, Klaus. (U. California, Los Angeles) **Drive versus cognitive theory: A reply to Boor and Harmon.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 258-262.—Argues that the Hull-Spence conception cannot clearly predict the findings in this area, that M. Boor and J. Harmon (see PA, Vol. 46:Issue 3) have misinterpreted B. Weiner's theoretical position, and that other conceptions of behavior (e.g., attribution theory) may account for the reported results. A replication of the Weiner study is presented, which includes the data called for by Boor and Harmon. Again drive theory was contradicted, while the data fit readily within cognitive conceptions.—*Journal abstract*.

4227. Young, Joseph L. (State U. New York, Stony Brook) **Reinforcement-test intervals in paired-associate learning.** *Journal of Mathematical Psychology*, 1971(Feb), Vol. 8(1), 58-81.—Studied learning in

paired-associate items in relation to the lengths of the intervals between the reinforcements (Rs) and the test trials (Ts) on each item, in order to gather data on the roles of these intervals and of the Ts and Rs themselves in learning. Ss were 100 undergraduates. The sequence of events for an item can be depicted as follows (where I denotes an intervening trial on another item): R_1 , (Ils), T_1 , (Ils), R_2 , (10 Is), and T_2 . Some items had T_1 omitted entirely. Results indicate that (a) the inclusion of T_1 enhanced performance on T_2 ; (b) on items with T_1 omitted, as the R_1 - R_2 interval increased, the probability of being correct on T_2 ($P(C_2)$) 1st increased and then declined; and (c) with the R_1 - R_2 interval length fixed, as T_1 moved from just after R_1 to just before R_2 , $P(C_2)$ rose and then fell. The nonmonotonicity of these results made it impossible to fit these data with any simple variant of stimulus sampling theory or extant Markov models with long- and short-term memory stores. A new model, with its main innovative feature the postulation of multiple short-term memory states, each with unique properties, is proposed; its fit to the data is quite satisfactory. (28 ref.)—*Journal abstract*.

Reinforcement

4228. Dorsey, Thomas E., Kanfer, Frederick H., & Duerfeldt, Pryse H. (U. Portland) Task difficulty and noncontingent reinforcement scheduled as factors in self-reinforcement. *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 323-334. Frequency of self-reward (SR) was examined as a function of both socially mediated reinforcement provided by E during acquisition (E-administered reinforcement) and level of difficulty of the task for which self-reward was given ($N = 90$ female undergraduates). Results indicate both variables operate in an additive fashion, with higher self-reward rates following higher E-administered reinforcement training and lower self-reward rates when the task becomes more difficult. Thus, a high E-administered reinforcement tends to liberalize S's criteria for self-reward, while increased difficulty tends to make such criteria more conservative.—*Journal summary*.

MEMORY

4229. Ashby, W. R. (U. Illinois) Izmerenie pamyati. [Measurement of memory.] In V. V. Pavin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii" (See PA, Vol. 44 4609) 239-243. Discusses several aspects of the nature of memory. Since "quantities of memory" can be treated as "quantities of information" transmitted between earlier and later times, they are subject to the logic and mathematics of information theory. Hence, although a particular act of coordination in the nervous system may demand a certain total in quantity of communication, this total quantity has no unique partition into so much ordinary transmission and so much memory. The same act of coordination may be produced by differing mechanisms possessing different requirements for memory. The fact that the amount of memory required may be varied, provided that total memory required may be varied, enables (a) assessment of the possible mechanisms for efficiency and (b) selection of the most efficient. It is shown that the mechanism which is the most efficient may not be the obvious one. (English summary) *I. D. London*

4230. Bruce, Darryl & Papan, James P. The primacy effect of single-trial free recall. *CAI Center Technical Memorandum, Florida State U.*, 1970(Jul), No. 19, 42 p.—Reports 3 experiments with 84, 160, and 213 undergraduates using a single-trial free-recall procedure. Ss were sometimes presented a forget cue during a list, meaning that they were not responsible for recalling any of the words which preceded it only those which followed it. Since the primacy effect over the functional beginning of such lists was not diminished, the intra-serial-proactive inhibition hypothesis was rejected. The primacy effect may be due to initial list members being relatively free of proactive inhibition, spending longer time in a limited capacity rehearsal buffer or being associated with stronger retrieval cues. Tests of memory showed consistently depressed retention of items immediately preceding a forget cue. This result is considered to be more in harmony with a rehearsal-buffer notion than a stronger-retrieval-cues position. (23 ref.)

Journal abstract

4231. Carron, Albert V., & Marteniuk, Ronald G. (U. Saskatchewan, Saskatoon, Canada) Retention of a balance skill as a function of initial ability level. *Research Quarterly*, 1971(Dec), Vol. 41(4), 438-453. To examine the hypothesis that there would be differential forgetting among Ss differing in initial ability level, 180 high school males were given 50 practice trials on a balance skill the stabilometer. Layoff intervals of 1, 7, and 14 days were interpolated between trials 20 and 21, 30 and 31, and 40 and 41 respectively. Upon completion of the testing, all Ss were ranked according to performance scores on trials 1-4. To investigate the problem, 3 subgroups of 20 Ss each were formed: a high ability, an average ability, and a low ability group. Performance scores for these 60 Ss were used in the analysis. Although there were no differences in forgetting among the groups for the 1- and 7-day layoffs, a significant interaction between ability and forgetting was evidenced following the 14-day layoff.—*Journal abstract*.

4232. Clark, Linda, Knowles, John H., & Maclean, Alistair. (Queen's U., Kingston, Ontario, Canada) The effects of method of recall on performance in the dichotic listening task. *Canadian Journal of Psychology*, 1971(Jan), Vol. 24(1), 193-198.—Reports 2 experiments with 100 undergraduates in which Ss were required to recall dichotically presented digits (3) orally either vocally or in writing. It was found that items in the span reported and were recalled significantly more accurately with written as compared with vocal recall. Data suggest that the differential accuracy of recall of the items in the 2nd spans, which is normally reported, is attributable, partially at least, to interference at output produced by the vocalization of items in the 1st span.—(French summary)—*Journal abstract*.

4233. Dale, H. C., & McGlaughlin, Alex. (U. Hull, England) Evidence of acoustic coding in long-term memory. *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 1-10.—Contrary to previous indications, retroactive interference in long-term paired-associate learning was found to be a function of acoustic similarity. Experimental groups (Ss were enlisted men and undergraduates) were exposed to the A-B-A-C paradigm where corresponding stimuli were homophones. Their retention scores were substantially and significantly lower than control groups run with an A-B-C-D paradigm. The failure of previous studies to reveal effects of acoustic similarity in this way is attributed to

the use of an insufficiently high degree of similarity. —*Journal abstract.*

4234. Darwin, C. J. (U. Connecticut) **Ear differences in the recall of fricatives and vowels.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 46-62.—Reports 2 experiments on the free recall of dichotically presented synthetic speech sounds. In Exp. I, with 1 left-handed and 13 right-handed undergraduate and graduate students, it was shown that the right ear advantage for initial fricative consonants is not simply a function of the recognition response class, but that it is also a function of the particular acoustic cues used to achieve that response. This is true both for the whole response, and for the constituent phonetic features. In Exp. II, with 36 right-handed Ss, it was shown that when both the response class and the particular stimuli presented on certain trials are held constant, the right ear advantage for the constant stimuli can be influenced by the range of other stimuli occurring in the experiment. Vowels showed a right ear advantage when, within the experiment, there was uncertainty as to vocal tract size, but they showed no ear advantage when all the vowels in the experiment were from the same vocal tract. These results are interpreted as demonstrating that there are differences between the ears, and probably between the hemispheres, at some stage between the acoustic analysis of the signal and its identification as a phonetic category. (48 ref.)—*Journal abstract.*

4235. Donderi, Don; Case, Bruce; Rossoff, Leonard, & Willis, Joanne. (McGill U., Montreal, Quebec, Canada) **Change in visual memory following discrimination learning.** *Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 401-416. Studied visual recognition memory for the size of circles for evidence of active memory change in 3 experiments with 34 paid volunteers and 83 undergraduates. In Exp. I the remembered difference in size between 2 circles which had been discriminated on the basis of size increased, while the remembered difference in size between the same 2 circles discriminated on the basis of brightness did not. In Exp. II, the remembered size of the smallest of 4 circles discriminated by size changed from 1 day to 1 wk. Each S in Exp. III inspected either 1 or 2 circles and was asked to remember their size. There was more memory distortion when 2 circles were remembered, but the distortion did not change over time. The evidence suggests that memory will actively change after a visual discrimination task. (French summary) —*Journal abstract.*

4236. Eagle, Morris; Goldberger, Leo, & Breitman, Martin. (Yeshiva U.) **Field dependence and memory for social vs neutral and relevant vs irrelevant incidental stimuli.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 903-910.—In 2 experiments with 21 female and 4 male paid volunteers in each (total N = 42 females and 8 males), field-dependent Ss showed better incidental memory for social words, while field-independent Ss showed an even division between recall of social and neutral words and a selective preference in recognition for neutral words.—*Journal abstract.*

4237. Kanungo, Rabindra N. & Mohanty, Gour S. (McGill U., Montreal, Quebec, Canada) **Differential roles of frequency and meaningfulness in free recall.** *Canadian Journal of Psychology*, 1970(Jun), Vol. 24(3), 161-168.—Performed 2 experiments with 91 experimentally naive high school students to study the comparative influence of frequency and meaningfulness (m) on free recall. In Exp. I, the free-recall scores of 3

lists of words matched for m but varying in frequency levels were compared. In Exp. II, free recall of 3 words matched for their frequency but varying in their values were compared. Findings reveal that frequency and not m of the words that influence free-recall, and that the influence of frequency is noticeable in the early times of free-recall learning. Findings are discussed in terms of the existing theories of verbal learning. (French summary) —*Journal abstract.*

4238. Levy, Betty A. & Baddeley, Alan. (McMaster U., Hamilton, Ontario, Canada) **Recall of semantic clusters in primary memory.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 1-13.—Investigated the use of semantic relatedness as a retrieval cue in the primary memory component in a free recall task using 24 paid undergraduates. 6-word semantically related clusters were placed in the middle and end positions of free recall lists. Retention was measured immediately after the list presentation and after a 15 sec retention interval of 15 sec. Pure primary memory functions were calculated. Results indicate that semantic cues were useful in retrieval from secondary memory but played no part in recall from primary memory. —*Journal abstract.*

4239. May, Richard B. & Tryk, H. Edward. (Victoria, British Columbia, Canada) **Word sequence, word frequency, and free recall.** *Canadian Journal of Psychology*, 1970(Oct), Vol. 24(5), 299-304. 3 groups of 22 undergraduates each were asked to memorize lists either (a) all common words, (b) all rare words, or (c) mixed list of alternating common and rare words. Terms of trials to criterion in free recall the groups ranked ordered rare > common > mixed. The typical high-frequency easier-recall effect was reversed in the mixed list where rare words were recalled more efficiently than common words. (French summary) —*Journal abstract.*

4240. McGaugh, James L. & Dawson, Ronald G. (California, Irvine) **Modification of memory storage processes.** *Behavioral Science*, 1971(Jan), Vol. 16, 45-63.—Reviews current findings and thinking concerning the nature and bases of "time-dependent" processes in memory storage. Considerable evidence indicates that there are 2 types of memory processes, short- and long-term memory. It is concluded that the bulk of the evidence is consistent with a "dual-store" hypothesis and that alternative interpretations of the findings are not well supported. Several conceptual models of the relationship between short- and long-term memory are presented and evaluated. The evidence most consistent with the hypothesis that short-term memory processes are different from but essential for development of long-term memory. Recent findings which provide some understanding of the neurobiological bases of the treatments which modify memory storage processes are reviewed. It is suggested that knowledge of the behavioral effects of treatments which influence memory considered together with knowledge of the effects at a neurobiological level may provide some clues to the biological bases of memory. (3 p. ref.) —*Journal abstract.*

4241. Nevel'skii, P. B. & Bocharova, S. P. (Khabarovsk, U.S.S.R) **Skorost' zapominaniya pri raznoyavostoynosti simvolov.** [Speed of memorization with different probabilities for the presentation of symbols employed.] *Problemy Bioniki*, 1968(Nov), No. 1, 120.—Investigated the speed of long-term memorization

when: (a) the number of memorized symbols (15 numbers) does not change and the numbers of digits (3) of these symbols remains also unchanged, but in connection with a change in the probability of presentation of these symbols; and (b) information in response to the symbols undergoes along with all transmitted information. Speed of memorization of units of information, transmitted in a unit of time, was utilized as an "important index." It was shown that speed of memorization depends in greater measure on quality of information rather than on number of symbols.—*I. D. London.*

4242. Perfetti, Charles A. & Goodman, Doba. (U. Pittsburgh, Learning Research & Development Center) **Memory for sentences and noun phrases of extreme depth.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 22-33.—Investigated memory for orally presented noun phrases and sentences using 40 undergraduates in Exp. I and 60 in Exp. II. Syntactic depth (D) of the phrases and sentences was varied with D approaching the values of 7 ± 2 . Consistent with recent investigations, these studies found D not to be generally related to recall of sentences, phrases, or individual words within sentences. However, recall of individual words from an adverbial noun phrase apparently was related to D. The apparent relationship is accounted for not by depth of individual words, but in terms primarily of superior noun retention and its interaction with serial position effects. In addition, conditional recall probabilities for another type of phrase, a noun phrase with prenominal adjectives, indicate stronger relationships between adjectives and the noun than between successive adjectives. It is concluded that the Yngve grammar is deficient as a psycholinguistic model.—*Journal abstract.*

4243. Postman, Leo & Stark, Karen. (U. California, Berkeley) **The effects of item familiarization on the long-term retention of paired-associate lists.** *Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 486-498.—Investigated the effects of prior item familiarization on the acquisition and retention of paired-associate lists. Ss were 32 undergraduates in 8 experimental and 2 control groups. The critical items were trigrams which were paired with paralogues in the paired-associate task. There were 20 trials of learning, and recall was tested after 1 wk. The experimental treatments formed a $2 \times 2 \times 2$ factorial design. Familiarization was either (a) for stimulus or response terms, (b) relevant or irrelevant to the learning task, or (c) at a frequency of 10 or 40 exposures/item. Control groups were given no preliminary training. Performance on the early learning trials was facilitated by response but not by stimulus familiarization. Both relevant and irrelevant response familiarization increased long-term retention losses, whereas stimulus familiarization had no reliable effect on recall. It is concluded that response familiarization is a source of both facilitation and interference. (French summary) (15 ref.)—*Journal abstract.*

4244. Shapiro, S. I. (U. Hawaï) **Isolation effects, free recall, and organization.** *Canadian Journal of Psychology*, 1970(Jun), Vol. 24(3), 178-183. Studied the influence of isolated words upon free recall and clustering of categorized lists. For Exp. I with 104 undergraduates, the list contained 10 words from each of 4 conceptual categories and the category names, and for Exp. II with 96 Ss, 11 members of 4 categories and no names. Category members were presented in blocked or

random order for 4 presentation-recall periods. Isolation effects occurred for random presentation with either category names or members as isolates. The superior recall of isolates was at the expense of other words in the list. Clustering of the categories with an isolate or for the over-all list was not affected by isolates, indicating that they did not influence the organization of the lists. Recall and clustering with block presentation were superior to random presentation. (French summary)—*Journal abstract.*

4245. Šipoš, Ivan & Graca, Štefan. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Word recognition under load.** *Studia Psychologica*, 1970, Vol. 12(4), 282-289.—Ss had to recognize 40 out of a group of 160 words backplayed off a tape recorder. The load consisted of the Ss having to press a key to 1 of 10 figures on a special luminous panel. The load was presented to 3 groups of 25 Ss each, so that the 1st had it at the input, the 2nd at the output, and the 3rd at the input/output. The response parameter was the corrected performance and a high or low certainty of recognition. Results were compared with those of a similar experiment without load, and show the best mean performance to be with the output load which differed significantly from the other variants. The number of wrongly identified words in the 3 load variants increased by 100% as against the load-free experiment. With false alarms Ss use the response alternative of a low certainty in a significantly higher measure. Input load as also the input/output load—takes on the character of stress. Under influence of time the output-load performance proves to be the most stable while the load-free performance shows the biggest recognition decrement. (Czech & Russian summaries)—*Journal abstract.*

4246. Yarnes, A. Daniel & Barker, William J. (U. Guelph, Ontario, Canada) **Repetition versus imagery instructions in the immediate- and delayed-recognition of picture and word paired-associates.** *Canadian Journal of Psychology*, 1971(Feb), Vol. 25(1), 56-61.—22 undergraduates learned 2 paired-associate lists, each consisting of 18 picture pairs and 18 word pairs—of the items in each list were studied by repetition the remainder by imagery. Recall improved from List 1 to List 2 on the immediate test but there was no difference in lists on retest 1 wk. later. On both immediate and delayed tests picture pairs were recalled better than word pairs and imagery study proved superior to repetition study. Informing Ss of their study method for each stimulus at time of recall did not affect performance. Results lend further support to the superiority of pictorial memory over verbal memory and provide evidence supporting an hypothesis that imagery study is a more efficient learning strategy than is repetition study. (French summary)—*Journal abstract.*

Short Term & Immediate Memory

4247. Corballis, Michael C. & Luthie, Lorenz. (McGill U., Montreal, Quebec, Canada) **Two-channel visual memory.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 361-367. Reports 4 experiments with 20 undergraduates each in which Ss attempted immediate recall of word and color attributes of (a) series of 3 "Stroop" words (Exp. I and II), or (b) 3 colored number words (Exp. III and IV), presented either at 2 words/sec or 1 word/2 sec. Ss were instructed to give either channel

by-channel recall, grouping words and colors together, or temporal recall, in which the 2 attributes of each item were to be reported together. In Exp. I and III, in which words were to be reported before colors, channel-by-channel recall was better than temporal recall, especially at the fast rate. In Exp. II and IV, the colors were to be reported before the words, and channel-by-channel recall tended to be worse than temporal recall. In all experiments, serial position data suggests that the channel-by-channel strategy was to attend to 1 attribute (either words or colors) during presentation and hold the other in preattentive storage. By contrast, when instructed to give temporal report, Ss apparently alternated attention between attributes during presentation. (21 ref.)—*Journal abstract*.

4248. Cottrell, Nicholas B., Ingraham, Larry H., & Monfort, Franklin W. (U. Iowa) The retention of balanced and unbalanced cognitive structures. *Journal of Personality*, 1971(Mar), Vol. 39(1), 112-131.—To evaluate Heider's hypothesis that unbalanced cognitive structures are remembered less well than balanced structures, 32 Ss learned 4 balanced structures and 32 Ss learned 4 unbalanced structures. $\frac{1}{2}$ of each group was tested for retention 1 min. after learning, and $\frac{1}{2}$ of each group was tested 24 hr. later. 24 hr. after learning, individuals recalled fewer unbalanced structures than balanced structures ($p < .025$). From 1 min. to 24 hr., there was a decrease in the number of unbalanced structures recalled ($p < .005$), but not in the number of balanced structures recalled. (24 ref.)—*Journal summary*.

4249. Dowling, W. J. & Fujitani, Diane S. (U. California, Los Angeles) Contour, interval, and pitch recognition in memory for melodies. *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 524-531.—Demonstrated the role of melodic contour recognition in memory for melodies. Exp. I with 47 undergraduates as Ss (2×3 factorial design), involved short-term memory with comparison melodies either transposed or not transposed from the key of the standard. Separate groups had the tasks of distinguishing (a) between same and different melodies, (b) between some melodies and ones with only the same contour, and (c) between melodies with the same contour and different ones. The effects of transposition and task and their interaction were significant ($p < .001$). Untransposed melodies were recognized by their exact pitches, so that tasks a and b were equally easy. Contour recognition was more important with transposed melodies, so that task b was very difficult, and tasks a and c were easier. Task c was about equally difficult under both conditions. Exp. II with 28 undergraduates, involved recognition of distorted versions of familiar folk tunes having the same length and rhythmic structure. In ascending order of recognizability, these distortions preserved merely the harmonic basis of the melody, the melodic contour, and the contour plus the relative sizes of successive intervals between notes ($\chi^2 = 50.4$, $p < .001$).—*Journal abstract*.

4251. Lindley, Richard E. & Brown, Donald R. (California State Coll., Fullerton) Acoustic and associative coding in short-term memory. *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1),

14-21.—Short lists of word-digit pairs were presented to 456 college students. 1 of the words was repeated as a memory probe either immediately after list presentation or after a short rehearsal interval. The stimulus words were either acoustically identical or associatively related (up, down). Both acoustic identity and associative relatedness produced a memory decrement which decreased with rehearsal. 1 interpretation of these results is that the primary memory trace is a multiple-dimension one and that, given time, Ss can recover nonacoustic information from it. The data also indicate that the "fate" over time is different for acoustically similar and associatively related items.—*Journal abstract*.

4252. Lowe, D. G. & Merikle, P. M. (U. Waterloo, Ontario, Canada) On the disruption of short-term memory by a response prefix. *Canadian Journal of Psychology*, 1970(Jun), Vol. 24(3), 169-177.—4 groups of 12 undergraduates each recalled 8-consonant sequences immediately following presentation, following an interpolated spoken prefix, and following an interpolated written prefix. For the different groups, presentation was either auditory or visual and recall was either spoken or written. Only the spoken prefix disrupted recall of the sequences, and in all cases immediate recall and recall following the written prefix did not differ substantially. The disruptive effect of the spoken prefix was less when recall was written than when spoken. Results indicate that the decrement in recall produced by an interpolated prefix results primarily from a disruption in the central verbal processes required to maintain short-term memory. (French summary) (17 ref.)—*Journal abstract*.

4253. Turnage, Thomas W. & Steinmetz, Jenny L. (U. Maryland) Unit-sequence interference and short-term recall. *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 112-122.—2 experiments (Ns = 96 undergraduates in Exp. I, and 240 in Exp. II) were performed to evaluate unit-sequence interference in short-term serial recall. Both experiments replicated the previous finding of a curvilinear relationship between item frequency and recall a relationship predicted by interference theory. However, since the data showed little direct evidence for associative disruption of serial order, an alternative interpretation that does not stress concepts of associative chaining was considered.—*Journal abstract*.

THINKING

4254. Adair, Charles H., Hansen, Duncan N., Rayner, Gail E., & Agarwal, Adesh. Two simulated inquiry environments: A social simulation game and a CAI-based information retrieval system. *CAI Center Technical Memorandum, Florida State U.*, 1970(May), No. 16, 74 p.—Building upon an earlier collection of 5312 social science generalizations and the development of a taxonomic retrieval system, an information retrieval (IR) system was implemented within a 1500 computer-assisted instruction system, a social simulation game was developed, an attitude scale to appraise 3 affective factors was constructed within the game and IR learning tasks, and teachers' inquiry behavior was studied. An experiment was designed and executed within the game and IR system to further examine the outcomes of the attitude scale and to examine human inquiry behavior more closely. Results with 58 undergraduates indicate that primarily the IR system experience leads to improved inquiry behaviors. The feasibility and the

associated positive reaction of Ss to both the game and the IR system was established. A discussion of factors to be considered for further study is presented. (16 ref.)—*Journal abstract.*

4255. **Burke, Ronald J.** (York U., Toronto, Ontario, Canada) **Correlates of the ability to fragment and reorganize stored information.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 183-189.—In a series of investigations N. R. Maier and his colleagues investigated qualitative differences in the way human beings store and utilize learned material. 3 basic abilities were identified: (a) respecting associative bonds, (b) fragmenting associative bonds, and (c) reorganizing single elements. This investigation examined the correlates of individual differences in ability to fragment and recombine past learning using data from 5 independent studies. 3 independent samples of Ss (total N=187) were tested on various external measures. 12 different correlates, some used in 3 or more separate inquiries, failed to produce significant relationships. Some reasons for these findings are suggested.—*Author abstract.*

4256. **Ernest, Carole H. & Pavio, Allan.** (U. Western Ontario, London, Canada) **Imagery and verbal associative latencies as a function of imagery ability.** *Canadian Journal of Psychology*, 1971(Feb), Vol. 25(1), 83-90.—Examines RTs of Ss high or low in imagery ability under instructions to elicit a verbal associate or arouse an image to concrete and abstract noun stimuli. 16 high and 14 low imagers were selected from a sample of 77 volunteer undergraduates. Latencies were significantly shorter for high than low imagers, for concrete than abstract words, and for verbal than imagery instructions. 1 interaction showed that imagery latencies were shorter to concrete than to abstract stimuli, whereas the latencies of verbal associations did not differ for the 2 types of words; another revealed that the relative superiority of high over low imagers in reaction speed was greater when the stimuli were abstract. Correlational data suggest that verbal associations may be mediated by both verbal and imaginal processes, thus favoring high imagers in both instruction conditions, and that self-reports of imagery ability can reliably predict imaginal behavior. (French summary)—*Journal abstract.*

4257. **Greaves, George.** (Georgia State U.) **Differences in the size of drawings of an important symbol as a function of level of conceptual system functioning.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 54.—2 groups of Ss (N=27 college sophomores) functioning at low and high levels of conceptual complexity (Conceptual Systems 1 and 3) drew representations of the Soviet and American flags. While both groups drew the American flags the same size, System-1 Ss drew the Soviet flag larger than the American flag, while System-3 Ss drew it smaller. This supported previous research indicating that System-1 Ss sensitized to threatening stimuli while System-3 Ss repress such stimuli.—*Author abstract.*

4258. **Hunt, Earl.** (U. Washington) **What kind of computer is man?** *Cognitive Psychology*, 1971(Jan), Vol. 2(1), 57-98.—In computing systems information handling components are organized into a system architecture which is exercised by a program. A system architecture and componentry for simulating human information processing is described. The system is characterized by a number of input channels containing buffer memories connected in series and a central computing device which monitors the channels. The

central system contains a short-term memory for information seen in the past few sec. and an intermediate term memory which holds an abstract interpretation of events observed in the past few min. Both the central system and the peripheral channels have access to a very large memory for permanently stored information, but only the central device can write into long-term memory. Psychological studies of short-term memory, language comprehension, and problem-solving are interpreted as tasks for the described system. (4 p. ref.)—*Journal abstract.*

4259. **Seymour, Philip H.** (U. Dundee, Scotland) **Effects of repetition of display components on the latency of multiple reports of congruence.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 82-96.—6 volunteer graduate and undergraduate students gave grouped multiple reports of the congruence of each member of arrays of 1, 2, or 3 word-shape or shape-shape pairs, and a measure was taken of the time elapsing between onset of the array and initiation of a multiple yes/no report. Double and triple reports were initiated less rapidly than single reports. Replicated arrays, involving repetition of a display pair, gave similar response times for double and triple reports, and were classified faster than nonreplicated arrays requiring the same overt report. In the case of nonreplicated arrays triple reports were initiated less rapidly than double reports. Both classes of array showed substantial effects for congruence, giving slow response times where all pairs in the array were incongruent or where the left-hand or 1st reported display was incongruent. (18 ref.)—*Journal abstract.*

Problem Solving

4260. **Gormly, John.** (Rutgers State U.) **Cognitive structure: Functional unity in verbal and mathematical performance.** *Journal of Personality*, 1971(Mar), Vol. 39(1), 70-78.—Examined the association between a dimension of cognitive structure and problem-solving behavior. 104 undergraduates were given problems which varied according to their intrinsic difficulty (the amount of information which was necessary for solution) and extrinsic difficulty (the degree of abstractness in the language describing the problem). Each problem was accompanied by 2 kinds of information: that which was essential to the solution and that which was extraneous. Ss assessed as cognitively comprehensive, using Rokeach's Interrelations Task, performed better at solving more logically complex problems than those designated as noncomprehensive. (23 ref.)—*Journal summary.*

4261. **Guthrie, John T.** (Johns Hopkins U., Center for Study of Social Organization of Schools) **The effect of two types of verbal hierarchy on problem solving.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 213-218.—Research on objects problems, i.e., Maier's 2-string problem, is reviewed and critiqued. It is proposed that performance on objects problems is related to 2 types of mediators: uses, which are Ss' verbal responses to the object necessary for solution; and functions, which are Ss' verbal responses to the verbal statement of the problem. The dominance of these 2 types of mediators for a given problem was first obtained for each S (N=63 paid undergraduates). The time required to solve the problem was then measured for each S. The result was that speed of solution was directly

proportional to both the dominance of the use mediator and the dominance of the function mediator in their respective hierarchies for each S.—*Journal summary*.

4262. Joyner, Robert C. & Green, Christopher J. (York U., Toronto, Ontario, Canada) **Demonstration of computer-augmented group problem solving.** *Behavioral Science*, 1970(Sep), Vol. 15(5), 452-462.—Developed a computer program, CORD, that permits coordinated problem solving in conversational mode among operators of 3 computer terminals who are playing the common target game. CORD is trivially machine-adaptive in that the program makes inductive inferences from the players' inputs and outputs suggestions to the players for system performance improvement.—*Journal abstract*.

4263. Kürti, István. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **Adatok a gondolkodási stratégiák vizsgálati eljárásához.** [Data concerning research methods for strategies of thought.] *Pszichológiai Tanulmányok*, 1968, No. 11, 127-145.—Examined strategies for optimal ways of problem solving in 2 experimental settings. Procedures which deviated from the optimal course and the dynamics of the search for the best strategy were registered so the process of development could be followed. In this way trends and changes in thought structures during problem solving could be observed. Statistical processing of data furnished information on the structure some of the tasks assumed by particular Ss. Data were obtained on the different facts of hypotheses Ss formed in the beginning and then modified in the course of their practical operations. Studying the structure of tasks led to the recognition of the process by which Ss gradually detected the structural constituents of the tasks. Statistical processing of the data also shows that Ss differ in the number of steps they require, in the speed at which they reach the solution, in their willingness to take risks, and in their ability to utilize their initial hypothesis. Nevertheless, it is possible to classify them into basic types employing analogous thought strategies. (Russian summary)—*English summary*.

4264. Kürti, Jarmila. (Hungarian Academy of Sciences, Psychology Inst., Budapest) **A heurisztikus tevékenység pszichológiai vizsgálatáról.** [Psychological study of heuristic activity.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 85-102. Presents new ways of studying the process of heuristic activity. Among them, experimental games are applied as models of problem solving which has opened new vistas to psychological research. Original experimental methods, their fields of application, and their basic relations with psychology and with information theory are pointed out. 2 kinds of logical card-games are described with the experimental setting insuring automatic registration. Heuristic activity, the laws of rational behavior, manifested in the given experimental situation, can be investigated by (a) obtaining and processing of information and its role in plotting problem-solving strategies, (b) characteristics of orientation in the structure of the problem, (c) traits in developing the strategy leading to solution, (d) achievement in learning, (e) peculiarities in making decisions in the various cases of uncertainty as well as in wilful determination and self-assessment. (Russian summary)—*English summary*.

4265. Kürti, Jarmila. (Hungarian Academy of Sci-

ences, Inst. of Psychology, Budapest) **Az optimális stratégia alakulásának vizsgálata kísérleti modellhelyzetben.** [Examination of the development of an optimal strategy in an experimental model-situation.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 224-241. Through the use of the pyramid game (where a number of objects decreasing in size have to be transferred from position A, through B, to C) the effect of feedback on the development of an optimal strategy could be investigated. Knowledge of the number of steps required for the optimal solution influenced the development of such a strategy. (English & Russian summaries)—*M. Moore*.

4266. Simon, Herbert A. & Newell, Allen. (Carnegie-Mellon U.) **Human problem solving: The state of the theory in 1970.** *American Psychologist*, 1971(Feb), Vol. 26(2), 145-159.—Summarizes research of the past 15 yr. directed toward discovering and explicating the organization of information processes that underlies human problem solving. The basic characteristics of the human information processing system (IPS)—serial processing, small short-term memory, infinite long-term memory with fast retrieval but slow storage—impose strong conditions on the ways in which the system can seek solutions to problems in large problem spaces. The current theory is described in 4 broad propositions: (a) a few gross characteristics of the human IPS are invariant over task and problem solver; (b) these characteristics determine that a task environment is represented (in the IPS) as a problem space, and that problem solving takes place in a problem space; (c) the structure of the task environment determines the possible structures of the problem space; and (d) the structure of the problem space determines the possible programs that can be used for problem solving. These propositions and their relation to the known characteristics of the IPS are developed.—*Author abstract*.

4267. Stephenson, Robert W., Gantz, Benjamin S., & Erickson, Clara O. (American Inst. for Research, Silver Spring, Md.) **Use of analogies in order to facilitate invention.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 487-488. Undergraduates solved invention problems twice, using "obvious" as well as "strange and apparently irrelevant" analogies to help them arrive at a solution. Ss also listed all of their ideas for a solution before they started. The solutions arrived at with the aid of the analogies were rated as more original and more acceptable than the best preliminary suggestion for a solution. The solutions based upon the strange and apparently irrelevant analogy were rated as more original (but not more acceptable) than the solution based upon the obvious analogy.—*Author abstract*.

4268. Wason, P. C. & Shapiro, Diana. (University Coll., Psycholinguistics Research Unit, London, England) **Natural and contrived experience in a reasoning problem.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 63-71.—Studied the effects of prior experience on a deceptive reasoning problem. In Exp. I Ss (24 paid undergraduates) were presented with the problem after they had experienced its logical structure. This experience was, on the whole, ineffective in allowing subsequent insight to be gained into the problem. In Exp. II, with 32 undergraduates, the problem was presented in "thematic" form to 1 group, and in abstract form to the other group. 10 out of 16 Ss

solved it in the thematic group, as opposed to 2 out of 16 in the abstract group. 3 hypotheses are proposed to account for this result.—*Journal abstract.*

Concepts

4269. Cohen, John; Boyle, L. E., & Chesnick, E. I. (U. Manchester, England) **Inférences subjectives sur échantillon.** [Subjective inferences on scaling.] *Journal de Psychologie Normale et Pathologique*, 1970(Oct), No. 4, 389-402.—Ss were presented with a vase and asked to imagine that it contained 20 pearls some white, some black, but that the proportion of each color had been established by chance. The task was to indicate how many pearls of each color were in the vase, in a series of presentations. The following conclusions were drawn: (a) Ss prefer to maintain their evaluation of the composition of a binary population and to modify their level of confidence in these evaluations, rather than to maintain their level of confidence and modify their evaluations; (b) to the extent that the evaluations change, they tend to reflect the most recent binary presentation; (c) to the extent that levels of confidence change, independently of evaluations, they tend to augment rather than lower; and (d) though the extent of scaling is constant, the effect of an increase in the population to evaluate tends to make the Ss more reluctant to modify their evaluations as well as their levels of confidence.—L. A. Ostlund.

4270. Erickson, James R. (Ohio State U.) **Problem shifts and hypothesis behavior in concept identification.** *American Journal of Psychology*, 1971(Mar), Vol. 84(1), 100-111.—When college-age Ss (Ns = 128 in Exp. I, 100 in Exp. II, 48 in Exp. III, 40 in Exp. IV, and 80 in Exp. V) were given thorough instructions stressing the nature of the solution of the problems and pointing out stimulus dimensions, a reversal shift was more difficult than an extradimensional shift, or there was no difference between them. When Ss were given brief instructions that they were to learn which stimuli fell into each of 2 categories, the reversal shift was easier. A hypothesis-sampling model accounts for the 1st set of data; Kendler and Kendler's mediational theory of concept learning accounts for the 2nd. (15 ref.) *Journal abstract.*

4271. Evans, David R. (U. Calgary, Alberta, Canada) **Conceptual complexity, arousal, and epistemic behaviour.** *Canadian Journal of Psychology*, 1970(Aug), Vol. 24(4), 249-260.—Describes 2 studies with 90 undergraduate Ss testing D. E. Berlyne's theory of epistemic behavior. Exp. I investigated the relationship between (a) conceptual complexity and level of arousal; and (b) conceptual complexity and looking time. In Exp. II, the relationship between conceptual complexity and epistemic behavior was studied. Results suggest that there is an optimal level of conceptual complexity, and that exposure to conceptual complexity above the optimal level results in increases in both level of arousal and epistemic behavior. (French summary) (41 ref.) —*Journal abstract.*

4272. Hastings, Margaret A. & Evans, Selby H. (Texas Christian U., Inst. for the Study of Cognitive Systems) **Schematic concept formation as a function of stimulus display and mode of response.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Feb), No. 3-70, 28 p.—A pattern generation system, VARGUS 9, produced stimulus instances from 2

populations with known distributions. 20 instances from each population (schema family) were mapped into serriform, histoform, and airplane formats. Within each stimulus type, pattern pairs received both a schema-family classification and a graded-response judgment. Results with 45 undergraduates indicate both stimulus display and response requirement influence performance in schematic concept formation tasks. High positive correlations were obtained between dichotomous and graded response measures. Maximum discrimination was produced by a classification decision and a concomitant but separate similarity judgment.—*Journal abstract.*

4273. Miller, Lance A. (IBM, Thomas J. Watson Research Center, Yorktown Heights, N.Y.) **Hypothesis analysis of conjunctive concept-learning situations.** *Psychological Review*, 1971(May), Vol. 78(3), 262-271.—Presents mathematical expressions for a taxonomy of conjunctive concept-learning situations, giving the number of possible hypotheses concerning the problem rule as a function of the task informational variables. The number of initially possible hypotheses is shown to be a function of preproblem knowledge of the number of relevant dimensions, the type of initial focus stimulus, and the problem parameters. During problem solution, reduction in the number of possible hypotheses is shown to be a function of the interstimulus similarity. Optimal stimulus selection procedures and expressions for the expected trial of solution are derived for various task situations involving the selection paradigm. (16 ref.) —*Journal abstract.*

DECISION & CHOICE BEHAVIOR

4274. Lupfer, Michael & Jones, Mark. (Memphis State U.) **Risk taking as a function of skill and chance orientations.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 27-33.—Whether a person believes the outcomes of his decisions are dependent upon skill or chance presumably influences the riskiness of his choices. 32 undergraduates made a series of decisions while playing Jeopardy, a game which was perceived as requiring skill, and another series of decisions while playing a card game, the outcomes of which were believed to depend on chance. As expected, decisions made under a skill orientation were marked by (a) a higher mean level of risk, and (b) a less variable pattern of risk than decisions made under a chance orientation. However, attempts to identify the process that mediated the relationship between skill-chance orientation and risk taking were unsuccessful.—*Journal abstract.*

4275. O'Donnell, Clifford R. & Brown, Larry T. (Hawaii) **Post-decision changes in time spent viewing chosen and rejected alternatives.** *Canadian Journal of Psychology*, 1971(Feb), Vol. 25(1), 1-6.—Investigated postdecision changes in time spent viewing chosen and rejected alternatives as a function of providing 30 undergraduates with positive information (PI), negative information (NI), or no information (NOI) as to the correctness of their decisions. The procedure consisted of (a) recording the time spent by each S viewing each of a series of nonrepresentational patterns, (b) presenting the 2 patterns closest in viewing time for a decision, (c) providing either PI, NI, or NOI as to the correctness of the decision, and (d) presenting the series of patterns a 2nd time and recording once again the time spent viewing each. Consistent with the results of studies

employing ratings or rankings of attractiveness, analyses of variance revealed that the Ss of the NOI group increased their viewing of the chosen alternative ($p < .01$). In addition, the increase was greater for Ss of the NOI group than for Ss of group PI ($p < .05$). It is concluded that making a decision may affect the amount of time during which chosen stimuli are subsequently examined, and possibly that postdecision dissonance may be reduced by the receipt of positive information. (French summary)—*Journal abstract*.

4276. Rökusfalvy, Pál. (Hungarian Coll. for Body Culture, Budapest) **Eine mehrstufige Methodik zur untersuchung der Leistungsmotivation un der Entscheidung.** [A multi-stage procedure for ascertaining achievement motivation and decision-making.] *Studia Psychologica*, 1970, Vol. 12(4), 296-302.—Discusses theoretical aspects of the method of decision-making in experiments. On the basis of experiments by J. W. Atkinson, D. E. Berlyne, J. Cohen, W. Edwards, and H. D. Schmidt, the following items were studied: (a) transfer effects of performance motivation; (b) effect of the measure and type of risk on decision-making; (c) effect of experience of success and failure on various parameters of decision-making; (d) decision making times dependent on situational factors; and (e) relation between subjective and objective probability scales. 3 6-stage experiments were performed in the form of individual tests. Ss were 60 undergraduates divided into 3 homogeneous groups. The following combinations of tests and instruments were used: (a) Crawford Small Parts Dexterity Test; (b) an electronic meter for measuring RT with a digital recording instrument, and (c) an instrument for measuring decision-making time. The data were processed, for the most part, by non-parametric mathematical-statistical methods and information-theoretical procedures. (Czech & Russian summaries)—*English abstract*.

4277. Rökusfalvy, Pál. **Teljesítmény-motiváció és döntés.** [Performance motivation and decision.] *Psichológiai Tanulmányok*, 1970, Vol. 12, 267-283.—Presents a preliminary report on experimental methods employed in the field of psychological decision theory. Following J. W. Atkinson, W. Edwards, D. E. Berlyne, J. Cohen, and H. D. Schmidt, 5 Ss were investigated: (a) accidental transfer effects of performance motivation, (b) influence of degree and quality of risk upon decision, (c) effect of success and failure on various decision parameters, (d) the time it takes to arrive at a decision as a function of situation and probability factors, and (e) the connection of objective and subjective probability scales in decision. 3 series of experiments, each consisting of 6 steps, were conducted. The Ss—3 groups of undergraduates with 20 in each group—were tested individually. The following tools were used: (a) Crawford Small Parts Dexterity Test; (b) Rock and Taylor electronic RT apparatus, with RACAL-type digital registration unit; and (c) J. Tóth's decision time apparatus. Data processing was performed mainly with nonparametric mathematical statistical methods and information theory procedures (calculation of entropy). In the interpretation of results Atkinson's model of risk-taking behavior and Edward's SEU model were applied. (Russian summary) (17 ref.)—*English summary*.

PHYSIOLOGICAL PSYCHOLOGY

4278. Cadwallader, Thomas C., Semrau, Lorne A., & Cadwallader, Joyce V. (Indiana State U.) **Early phys-**

iological psychology: Circa 3000 BC. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 719-720.—Describes those portions of the Edwin Smith Surgical Papyrus relevant to the history of physiological psychology. This Egyptian papyrus, which contains material dating back perhaps to 3000 BC, records history's 1st description of the brain, its convolutions and meninges, of motor and sensory effects of neural damage, and, perhaps, of aphasia due to damage to the speech area of the brain. It further contains history's 1st record of: (a) inductive reasoning, (b) description of the heart and vascular system, and (c) recognition of the significance of the pulse. The Smith Papyrus contains the oldest science of which we have record.—*Author abstract*.

4279. Jacobs, Lewis. (Knickerbocker Hosp., New York, N.Y.) **Human Intelligence: The physiological view.** *Science Teacher*, 1968(Sep), Vol. 35(6), 13-17.—Discusses human intelligence, emphasizing the intrauterine environment of the growing fetus. Nutritional, metabolic, and neurological factors in maturational development are reviewed. The application of studies of the electrical activity of the human brain to intelligence is summarized. It is felt that the study of evoked potentials and their correlation with various social and psychological measures of intelligence has special promise.—*P. McMillan*.

4280. Makarova, A. R., Ponugaeva, A. G., & Rashevskaya, D. A. (Pavlov Inst. of Physiology, Leningrad, USSR) **O bezuslovnykh i natural'nykh uslovnykh refleksakh u yagnyat i kozlyat v rannem postnatal'nom ontogeneze.** [On unconditioned responses and natural conditioned responses in lambs and kids in early postnatal ontogenesis.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 246-249. Studied gas exchange in lambs and kids with changes in light and temperature of the environment and under the influence of food intake ("the specific dynamic action of food"). From the very 1st day of life chemical thermoregulation in kids was disclosed. In neonate kids gas exchange in the light was higher than in the dark. As the age of the animal increased, so did this reaction to light—from 4% on the 1st day to 28% on the 60th day. In lambs the reflex phase of the specific dynamic action of food was absent.—*I. D. London*.

NEUROLOGY

4281. Adey, W. R. (U. California, Los Angeles) **Kletochnye mekhanizmy i kharakteristiki nervnoi sistemy pri obrabotke informatsii.** [Cellular mechanisms and characteristics of the nervous system in information processing.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 219-238.—Discusses the construction of a theory to explain how information is coded at the higher levels of the brain, with great reliance put on wave processes and the "enormous ability" of the brain to operate in parallel fashion. The discussion is developed through consideration of the following topics: (a) essential phenomena in the transformation of information in nervous pathways, (b) intimate aspects of organization of brain tissue and the neuron as 1 of the elements of brain tissue, (c) the connection between neuronal activity and the usual EEG, (d) the correlation between EEG activity and the behavioral processes, and (e) the union of hypotheses on brain organization. "It is necessary to avoid simple analogies with nerve nets

where only impulses circulate or, what is worse, with the present generation of computer apparatus which are characterized by their limited character of parallel access and by logical elements possessing only binary function." (English summary) (59 ref.)—*I. D. London.*

4282. Alekseeva, M. S., Dmitriev, Yu. S., & Ereemeev, N. S. (Pavlov Inst. of Physiology, Leningrad, USSR) **K voprosu ob analizatornoi deyatel'nosti dlkikh serykh kryk.** [On the analyzer activity of wild gray rats.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 3-6.—10 wild gray rats, conditioned to a sequential stereotype of CSs (bell, light, bell) with maze electrode defensive reinforcement, were Ss in a study to elucidate the leading role of the visual or auditory analyzer in CR activity. Variations away from the stereotype were tested: (a) bell sounded 5 times, (b) light flashed 5 times in order, (c) bell and light applied simultaneously 10 times with choice in movement to either the left or right, and (d) 10 trials without utilization of signals. It was shown that (a) the chief role in CR activity belonged to the signal stimulus, and (b) the visual analyzer played the leading role.—*I. D. London.*

4283. Barchas, Jack D., Ciarello, Roland D., & Steinman, Alan M. (Stanford U., Medical School, Palo Alto, Calif.) **Epinephrine formation and metabolism in mammalian brain.** *Biological Psychiatry*, 1969(Jan), Vol. 1(1), 31-48.—Studied the uptake and metabolic disposition of iv and intraventricularly administered epinephrine (E) and the enzymatic formation of epinephrine in male Simonson rat brain. Following iv administration, highest concentration of the catecholamine was seen in the pineal and pituitary glands, although the brain also took up significant amounts. The pineal and pituitary retained most of their activity as unchanged E, while the brain principally formed metanephrine and vanillyl-mandelic acid. Unlike the metabolic pathway employed for iv administered epinephrine, following intraventricular injection most of the epinephrine metabolites were seen to be conjugated products. The $\frac{1}{2}$ -life in the brain for an intraventricular dose of epinephrine was $2\frac{1}{2}$ hr. Therefore, despite low resting levels of the hormone, the evidence suggests that epinephrine is turned over rapidly in the brain. In the studies of the enzymatic synthesis of epinephrine, a specific anatomic distribution of enzyme activity was observed, activity being highest in the rostral brainstem region. This enzyme may be associated with the particulate fractions of brain homogenates. The presence of an inhibitor present in brainstem particulate fractions was observed which markedly inhibits adrenal phenylethanolamine N-methyl transferase and may exert a similar effect on the brain enzyme. Synthesis of epinephrine in the brain is probably associated with a particulate fraction and may be regulated by an inhibitor. It is concluded that epinephrine can be synthesized and rapidly metabolized by brain and may function as a neuroregulatory agent. (25 ref.) *Journal abstract.*

4284. Batuev, A. S. (Leningrad State U., USSR) **Znachenie kortikofugal'nykh vliyaniy dlya mezhanalizatornoi integratsii.** [Significance of corticofugal influences for interanalyzer integration.] In corticofugal influences for interanalyzer integration. S. P. Nariakashvili (Ed.). "Korkovaya regulatsiya deyatel'nosti podkorkovykh obrazovaniy golovno mozga." (See PA, Vol. 46:Issue 2) 189-206. Presents data on the physiological significance of the corticoregulatory mechanisms in the integration of

heteromodal information. Ss were cats and rats in experiments making use of electrophysiological and conditioning methods in combination with surgical intervention and pharmacological treatment of the cortex. It was shown that the regulatory effect of the cerebral cortex upon the relay nuclei is mediated through 3 mechanisms: (a) cortical regulation of each sensory system; (b) cortical action mediated by the reticular formation, modulating afferent inputs on the receptor and central relay levels; and (c) direct corticopyramidal regulation of a number of analyzers. From this point of view the frontal cortical regions and the brainstem reticular formation should be considered as a system regulating the afferent stream. The dynamics of the integration observed between cat analyzers during conditioning revealed that the properties of nervous processes differ significantly. It is concluded that direct integration of all 3 mechanisms of cortical regulation of the afferent systems provides the means by which previously unbalanced analyzers may be more completely integrated. (English summary) (2 p. ref.)—*I. D. London.*

4285. Bekhtereva, N. P. (Inst. of Experimental Medicine, Leningrad, USSR) **Nekotorye dannye o fiziologii strukturno-funktsional'nykh otnosheniyakh podkorkovykh obrazovaniy golovno mozga cheloveka.** [Some data on the physiology of the structural-functional relationships of the subcortical structures of the human brain.] In S. P. Nariakashvili (Ed.). "Korkovaya regulatsiya deyatel'nosti podkorkovykh obrazovaniy golovno mozga." (See PA, Vol. 46:Issue 2) 65-78.—Presents conditions for optimal physiological examination of the human brain along with methods for studying the neurophysiological bases of human mental activity. Ss were patients undergoing diagnosis and treatment through prolonged utilization of multiple electrodes. Data are presented on changes in (a) the electrosubcorticogram, (b) steady potential shift, (c) oxygen supply level, and (d) regional impulse activity in the brain during psychological testing (operative memory tests and presentation of emotional stimuli). Along with those on emotional reactions and changes in mental activity resulting from electrical stimulation of the brain. Changes in the electrosubcorticogram were shown to spread during psychological testing, the character of the former depending mainly on initial electrical activity. Changes in steady potential shift, impulse activity and oxygen supply level were consistently reproduced during testing. These changes depended on the particular structure involved and the test employed. It is suggested that a corticosubcortical morphophysiological system exists, with links of varying degrees of firmness, which participates in mental activity under changing conditions. (English summary) (21 ref.)—*I. D. London.*

4286. Benedetti, G. (U. Basel, Psychiatric Clinic, Switzerland) **Das Unbewusste in neuropsychologischer Sicht.** [The unconscious from the neuropsychological viewpoint.] *Nervenarzt*, 1969(Apr), Vol. 40(4), 149-155.—Reviews the neuropsychological literature dealing with the unconscious, a fringe subject of neuropsychology, the investigation of which essentially belongs to the domain of psychoanalysis and psychodynamics. Neuropsychology describes as unconscious those fragments of behavior which temporally as well as in their integration are less connected to the whole. Unconscious in the primary sense are (a) neurophysiological processes that occur outside the psychic behavior, e.g., the forming of macromolecules in memory processes; (b)

neuropsychological mental processes that concern the whole individual, and not just the interaction of individual neural systems, which last only a fraction of time and do not cross the threshold of consciousness; and (c) neuropsychological processes of longer duration that are not connected with word images, and in which phenomena like extinction, inhibition, transference-resistance, etc., play a part. (55 ref.)—*B. Schay.*

4287. **Beritashvili, I. S.** (Inst. of Physiology, Tbilisi, USSR) **O roli obratnoi afferentsatsii v individual'no priobretennom povedenii.** [On the role of feedback afferentiation in individually acquired behavior.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 270-276.—Using data derived from experiments with dogs, analyzes the role of feedback afferentiation and Anokhin's "acceptor of action," i.e., "a central cortical mechanism [in a self-regulatory functional system] picking up feedback impulsation arising as the result of reflex [or behavioral] action," in consummatory "image-directed behavior." The importance of feedback afferentiation in the beginning of formation of an alimentary-motor CR, directed chiefly by the image of the position of the alimentary reinforcement, is stressed. After the alimentary-motor behavior is automatized and operates as a chain CR, feedback afferentiation is no longer necessary. (English summary)—*I. D. London.*

4288. **Biryukov, D. A.** (Inst. of Experimental Medicine, Leningrad, USSR) **O roli afferentnykh sistem v funktsional'noi organizatsii tselostnoi deyatelnosti mozga.** [On the role of afferent systems in the functional organization of cerebral activity as a whole.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 276-283.—Discusses a number of themes connected with the problem of afferent influence on the holistic organization of cerebral activity. Division of afferentiation within the nervous system into specific and nonspecific inputs depends on (a) systems of internuncial neurons, generating high-frequency rhythmic discharges, and (b) the selective distribution of neurons with high integrative levels. The functional lability of single neurons depends on afferent impulsational input. The preferential participation of certain afferent systems in mechanisms responsible for central tonus should be attributed to ecological factors which also determine the qualitatively different influences, exerted by systems within the same sensory modality, as a function of the signal significance of environmental factors of 1 type. Event probabilities and the statistical characteristics of signals should be taken into account in any analysis of the tonic activity of cerebral regulatory systems and the character of their phasic reactions. A certain mean level and variety of incoming information are essential for normal functioning of the nervous system. (English summary)—*I. D. London.*

4289. **Bullock, T. H.** (U. California, Medical School, San Diego) **Yazykh nervnykh kletok.** [The language of nerve cells.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 11-17.—Discusses what forms of neuronal signals are utilized and how these signals are processed, and analyzes certain problems of information transmission in the CNS such as the coding of latencies, the coding of discharge-probability, and number coding. A consideration of the theory and related experimental data leads to the conclusion that there are a number of

coding and decoding mechanisms in the nerve cells which are complexly heterogeneous and permutationally sequential in operation. In addition to the classical impulse-frequency code, other types and principles of coding are described—some dependent on nerve impulses; others not dependent on spaced impulses (coding of latencies, coding of discharge-probability, number coding). Germany) **Opticheskaya regulatsiya dvizhenii glaz, vnimanie i vospriyatie dvizheniya.** [Visual regulation of eye movements, attention and the perception of movement.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 431-442.—Presents the results of quantitative studies on the relationships between optokinetic nystagmus and motion detection, using registration of eye movements and scaling of velocity perception. Ocular following movements in the slow phases of optokinetic nystagmus were facilitated by visual attention; at higher stimulus velocities and with inattention, following movements became slower than stimulus velocities. The difference produced a moving retinal image related to the subjective increase in velocity (about double that perceived during eye following). Only adequate following movements during the slow phase of optokinetic nystagmus resulted in a correspondence between stimulus velocities and velocity perception. Afferent velocity perception from moving retinal images was exaggerated during eye fixation or insufficient following, but was suppressed during the rapid phase of optokinetic nystagmus. The

selective function of visual attention was studied in "railway nystagmus." Subjective motion sensation was shown to be dominated by movements of the object tracked with foveal attention. Motion perception and spatial determination were shown to be different during slow and rapid eye movements. During rapid saccadic movements visual motion perception was canceled, but spatial determination of the final direction of gaze was signaled accurately after the saccadic movement. Thus, during ocular saccadic movements or the quick phases of optokinetic nystagmus the visual world does not move in spite of rapidly moving retinal images. The findings are discussed in relation to the constancy of spatial perception and the subjective stability of the visual world.—*J. D. London.*

4295. Karamyan, A. I., Zagorul'ko, A. A., Belekova, M. G., & Kosareva, A. A. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **Morfofunktsional'nye osobennosti korkovo-podkorkovykh vzaimootnoshenii u domlekopitayushchikh pozvonochnykh.** [Morphofunctional features of cortico-subcortical interrelationships in premammalian vertebrates.] In S. P. Narikashvili (Ed.), "Korkovaya regulyatsiya deyatelnosti podkorkovykh obrazovani golovnoy mozga." (See PA, Vol. 46:Issue 2) 96-115.—Presents and discusses the specialization of some afferent and efferent functions in different divisions of the CNS in the early stages of their formation (in amphibians and reptiles). It was shown that the functional organization of the sensory system in premammalian vertebrates differs sharply from that in mammals. Thus, visual (frog, tortoise) and olfactory (tortoise) evoked potentials, recorded from the archi-, paleo-, and neocortex, are surface-negative, easily "fatigued," and have a tendency to recruitment in response to low-frequency stimulation. Study of the functional state of the cortical structures and the tectum opticum—the principal central structure of the tortoise visual system—showed that extirpation of the dorsal cortex (in the zone of maximal response to light flashes) results in augmentation of the visual evoked potentials in the tectum opticum evoked by light flashes. Strychninization or cortical stimulation produced a reverse effect (suppression of the evoked potentials). These data suggest the existence of a corticofugal regulatory influence of inhibitory character. In amphibians the thalamocortical integratory system is basically nonspecific in structure. In reptiles a clear tendency to articulate separate nuclear structures into communicational systems is noted. At the level of the reptile, specialization is more developed in the afferent system and arises earlier than in the efferent. The physiological and morphological findings show that afferent and efferent connections between subcortical structures and the cortex are established very early in cerebral phylogenesis. (English summary) (50 ref.)—*J. D. London.*

4296. Khanashvili, M. M., Obukhova, G. P., Silakov, V. I., & Burakova, N. S. (Inst. of Experimental Medicine, Leningrad, USSR) **Materialy k analizu kortikofugal'nykh vliyaniy na podkorkovye obrazovaniya zritel'noi sistemy.** [Materials for the analysis of corticofugal influences on subcortical structures of the visual system.] In S. P. Narikashvili (Ed.), "Korkovaya regulyatsiya deyatelnosti podkorkovykh obrazovaniy golovnoy mozga." (See PA, Vol. 46:Issue 2) 145-153.—Data from 15 nembalized cats suggest that the posterior thalamic nucleus, the pulvinar, preectal

region, lateral geniculate body, and especially the colliculus anterior may serve as a morphological substrate for the interaction of disconnected cortical centers. Thus, 1 of the mechanisms for cortical integration involves the relay of nerve impulses on the subcortical level. The data presented are considered as evidence for a descending cortical influence on the functions of subcortical visual centers, with the cortex acting tonically to exert a stabilizing influence upon the subcortical structures. (English summary)—*J. D. London.*

4297. Lisak, K. & Endröcz, E. (Inst. of Physiology, Pécs, Hungary) **Nervvanya i gormonal'naya regulyatsiya motivatsionnykh povedencheskikh reaktsii.** [Nervous and hormonal regulation of motivated behavioral reactions.] In V. V. Pann (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii" (See PA, Vol. 44:4609) 343-352.—In order to provide a neuroanatomical substrate for the integration of motivated behavioral patterns 2 antagonistically connected systems are proposed at the mes- and diencephalic levels: an inhibitory system in the caudal direction and an ascending facilitative system with an increase in the excitatory state in 1 of these systems resulting in a rebound effect in the other. Changes in the excitability level of these systems are held to form the neurophysiological basis of motivated behavior. Data derived from normal and castrated rats, are presented on the hormonal control of the excitability level of the brainstem-preoptic connections. By using the method of evoked potentials, a difference in the excitability level of the brainstem reticular formation between males and females was found—a sex dependent difference subject to conditioning with sexual steroids. The application of estradiol and/or testosterone in the preoptic region indicated the primary action of these steroids in this area. It is suggested that changes in the excitability level of the brainstem reticular core are due to influence of the forebrain structures exerted in the caudal direction. (English summary) (21 ref.)—*J. D. London.*

4298. Lisak, K. & Endröcz, E. (Inst. of Physiology, Pécs, Hungary) **The role of forebrain inhibitory functions in conditioning, motivation and self-stimulation behaviour.** In S. P. Narikashvili (Ed.), "Korkovaya regulyatsiya deyatelnosti podkorkovykh obrazovaniy golovnoy mozga." (See PA, Vol. 46:Issue 2) 156-170.—Discusses data amplifying the view that goal-directed motor patterns form the "spatial frame" of a learning and that the CR may be considered as a conditioned link between the motor pattern and the environmental signal. Thus, a conditioned link may be inhibited or facilitated by numerous environmental stimuli but the goal-directed motor pattern, acquired by a given situation cannot be eliminated from the brain. Experiments with cats and rabbits with chronically implanted electrodes show that (a) the medial forebrain bundle plays a basic role in the interpretation of motivated behavioral reactions, and (b) internal inhibition is highly implicated in the latter. The relationships between the ascending activating system and the frontal inhibitory system involved somatomotor and situation-specific reactions—an organizational pattern which forms the basis of motivated behavior. Positive self-stimulation is explained as a reinforced increase in internal inhibition and interruption of this enhanced inhibition results in "feedback action" on the part of the ascending activating system by integrating the same somatomotor pattern through which the animal received its intra-

cerebral stimulation. Electrical stimulation of the ascending activating system in the absence of specific sensory input results in (a) feedback action of the internal inhibitory processes, and (b) long-lasting inhibition of the integration of that somatomotor pattern which mediated intracerebral stimulation. (Russian summary) (21 ref.).—*I. D. London.*

4299. Mandell, Arnold J., Spooner, Charles E., & Brunet, Don. (U. California, Medical School, Irvine) Whither the "sleep transmitter." *Biological Psychiatry*, 1969(Jan), Vol. 1(1), 13-30.—Reports studies exploring the actions of a wide range of amino acids in relationship to behavioral sleep, using 1-5 day old White Leghorn chicks as Ss. In spite of the current interest of investigators of neurochemical substrates of sleep in either the norepinephrine or serotonin "position," a large variety of other amino acids and their products are as worthy of consideration as the current favorites. In addition, it appears that more than simple amine products of the amino acids may be of interest in that a wide variety of metabolic transformations (e.g., transmethylation) are waiting to upset any prematurely simple, single substance theory of such a complex nervous system function as sleep or sleep stage. (66 ref.).—*Journal abstract.*

4300. Marton, Magda L. (Hungarian Academy of Sciences, Psychology Inst., Budapest) *A magasabb rendű idegműködés tipológiájának szemlélete és módszerei*. [Aspects and methods in the typology of higher nervous activity.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 51-60.—Examines experimental procedures used in determining the parameters of higher nervous activity. It is emphasized that the typology of higher nervous activity characterizes the varieties of type along with fundamental plastic functions and the dimensions recognized by studying conditional reflex processes; in the majority of these investigations the differences in learning capacity are brought to light. Former static, constitutional typologies have been replaced by a dynamic typological conception concerned with the traits of the learning process. The effect of this conception on the emergence of behavior typologies is also analyzed. The applicability in educational psychology of a typology which considers the nervous system is highlighted. (Russian summary) (29 ref.).—*English summary.*

4301. Meshcherskii, R. M. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Funktsional'naya organizatsiya kortikofugal'noi sistemy zritel'nogo analizatora*. [Functional organization of the corticifugal system of the visual analyzer.] In S. P. Narikashvili (Ed.), "Korkovaya regulatsiya deyatel'nosti podkorkovykh obrazovaniy golovnogo mozga." (See PA, Vol. 46:Issue 2) 132-142.—Rabbits, cats, and rats (anesthetized and not) were Ss in a detailed study of the functional organization of feedback connections from the visual cortex to the lateral geniculate body. An attempt was also made to determine the pattern of corticifugal regulation of the afferent volley in the central chain of the visual analyzer. It was shown that the visual cortex exercised 3 types of effects on the lateral geniculate body: (a) an excitatory influence transmitted through axodendritic synapses, (b) an inhibitory corticifugal influence transmitted through axosomatic synapses, and (c) an inhibitory corticifugal influence associated with the presynaptic inhibition of lateral geniculate body neurons. The system of corticifugal connections may be activated through the

following pathways: (a) specific visual afferent, (b) the oligosynaptic transcallosal and (c) the polysynaptic interhemispheric. Corticifugal influence from the primary visual cortex can be modulated from the secondary. It is suggested that, in the thalamic relay nuclei, corticifugal influence removes redundant information and helps in the detection of signals of pragmatic significance. (English summary) (48 ref.).—*I. D. London.*

4302. Moruzzi, G. (Inst. of Physiology, Pisa, Italy) *Funktsional'noe znachenie sna*. [Functional significance of sleep.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 372-375.—There are 2 kinds of recovery in the brain involving both fast and slow recovery processes, with sleep appearing to be necessary for only the latter. Nervous structures involved in inborn stereotyped activities are characterized by fast recovery processes related to change in membrane permeability. The higher nervous structures concerned with perception, learning, and, above all, consciousness require slow recovery processes. For these highly specialized nervous structures, recovery work is likely to require a prolonged period of inactivity. "If these SRPs [slow recovery processes] were not concentrated within a given period of time, called sleep, we should be neither really awake nor completely asleep." Thus, the meaning of the brainstem and diencephalic mechanisms underlying sleep is to organize all the slow recovery processes, implying a loss or reduction of consciousness, within a well-defined period of time, in order that the animal may be really awake during the rest of the day. (English summary)—*I. D. London.*

4303. Narikashvili, S. P. (Ed.) *Korkovaya regulatsiya deyatel'nosti podkorkovykh obrazovaniy golovnogo mozga*. [Cortical regulation of the activity of the subcortical structures of the brain.] Tbilisi, USSR: Metsniereba, 1968. 364 p.—Presents a collection of 19 articles representing the papers of a 1966 symposium held in Tbilisi during the 5th All-Union Conference on Problems in the Electrophysiology of the Nervous System. Much of the ensuing discussions is reproduced.—*I. D. London.*

4304. Sager, O. (Neurological Clinic of Colentina Hosp., Bucharest, Romania) *Study on the cerebral cortical functions regulating the subcortical centers*. In S. P. Narikashvili (Ed.), "Korkovaya regulatsiya deyatel'nosti podkorkovykh obrazovaniy golovnogo mozga." (See PA, Vol. 46:Issue 2) 173-187.—Dogs and cats were used in chronic experiments to study the role of the cerebral cortex (neo- and paleocortex) in regulating the activity of certain subcortical structures. It was shown that the neocortex by its inhibitory and facilitative corticifugal fibers modulates the activity of the subcortical structures following the receipt of information from these very structures, thereby inhibiting or facilitating their activity. Similarly, the paleocortex through its paleocorticifugal fibers was shown to: (a) be involved in the proper performance of certain important functions such as the alimentary and sexual functions, especially with respect to information received from the hypothalamic centers; and (b) play an important role in the emergence of certain affective states. The hippocampus was shown to participate very much in the sleep-waking function in cerebellectomized and bilaterally neocorticated animals. An attempt was made to explain the rapid extinction of hippocampal conditioning, based on the role of the hippocampus in the memory process. The neocortex was shown to be

deeply involved in the maintenance of normal posture in the act of walking. (Russian summary) (24 ref.).—*I. D. London.*

4305. Shelikhov, V. N. & Rogacheva, S. K. (1st Medical Inst., Moscow, USSR) **Znachenie vozratnoi generalizatsii pervichno-korkovkh vobuzhdenii dlya integrativnoi deyatel'nosti golovnogo mozga.** [Significance of reverse generalization of primary cortical excitation for integrated activity of the brain.] In V. V. Parin (Ed.) "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 417-421.—Discusses the available data showing that any primary cortical excitation is subjected to wide generalization not only through numerous intracortical fibers (horizontal generalization), but also through circuit systems such as cortex-subcortex-cortex. The latter mechanism is termed "reverse generalization" and involves the brainstem reticular formation, medial thalamic nuclei, and subthalamic structures. Reverse generalization plays a role in all processes connected with the convergence of different excitation in the cortical neurons, in the closure of conditioned connections and the elaboration of CRs, in the formation of emotional reactions, etc. Reverse generalization plays a role in the pathogenesis of those diseases at whose basis lies a primary cortical focus of irritation (injury, tumor, epilepsy, etc.). Reverse generalization is also involved in the formation of an inert subcortical focus of excitation which continues to operate as a secondary focus of excitation even after elimination of the primary cortical focus. (English summary) (25 ref.).—*I. D. London.*

4306. Shidlovskii, V. A. (1st Medical Inst., Moscow, USSR) **Problema vegetativnykh komponentov uslovnykh i bezuslovnykh refleksov, motivatsii i emotsii.** [The problem of the autonomic components of conditioned responses and unconditioned responses, motivations, and emotions.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 422-431.—6 dogs with a "strong type" of nervous system were Ss in a study of the autonomic components of the orienting reflex and of alimentary and defensive CRs and UCRs. It is concluded that the autonomic components of CRs have an adaptive character and reflect the adaptation of the organism to forthcoming activity. The character and intensity of these reactions are defined as both the motivated state of the animal (degree of hunger, thirst, etc.) and the emotional state, depending on the coincidence and noncoincidence of the expected with reality. Experimentation with probability reinforcement discloses the role of the animal's individual experience in evaluating the signal significance of stimuli. (English summary) (29 ref.).—*I. D. London.*

Special attention is given to the results achieved in the field of electrophysiology and to the works of A. R. Luria. (Russian summary) (24 ref.).—*English summary.*

4308. Traugott, N. N., et al. **O roli nespetsificheskikh sistem v deyatel'nosti bol'shikh polusharii golovnogo mozga cheloveka.** [On the role of nonspecific systems in the activity of the human cerebrum.]

In N. N. Traugott, et al., "Ocherki psikhofarmakologii cheloveka." (See PA, Vol. 46:Issue 3) 287-323.—Discusses how, under the action of psychopharmacological agents, the redistribution of the activity of the nonspecific systems affects the activity of the cerebrum and how, under such action, increase or decrease in the activity of the different nonspecific systems affects CR activity, the sensory functions, and behavior as a whole. Data from the following areas of research are presented: (a) nonspecific systems and CR activity (retention of CRs, generalization of CRs, internal inhibition, defensive CRs, relatively complex forms of cortical activity), (b) nonspecific systems and sensory functions (absolute thresholds for long-acting sounds, differential thresholds for frequency and intensity, absolute thresholds for the detection of tonal messages of small duration—up to 20 msec.—thresholds of autonomic reactions to acoustic stimulation, adaptational capacity of the auditory apparatus, discrimination of articulated speech, discrimination of tonal signals and the sounds of speech from noise), and (c) nonspecific systems and behavior (dominance on the part of the ascending influences from the anterior hypothalamus and decrease in the activity of the reticular formation, the thalamic nonspecific systems, and the caudate nucleus; dominance on the part of ascending influences from the thalamic nonspecific systems with decrease in the activity of the nonspecific systems of the posterior hypothalamus and brainstem reticular formation; increase in the activating influences of the reticular formation, associative and nonspecific nuclei of the thalamus; increase in the activating influences of the reticular formation and posterior hypothalamus with depression of the activity of the nonspecific nuclei of the thalamus). (3 p. ref.).—*I. D. London.*

4309. Zachynayeva, I. A. & Éksler, N. D. (Inst. of General & Communal Hygiene, Moscow, USSR) **Elektrifiziologicheskii analiz deyatel'nosti obonyatel'nogo analizatora.** [Electrophysiological analysis of the activity of the olfactory analyzer.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 310-319. Ss were awake rabbits with chronically implanted electrodes. The orienting reaction to new experimental situations resulted in (a) desynchronization of the electrical activity in the sensorimotor cortex, and (b) regular rhythm in the temporal and occipital regions of the brain, in the hippocampus and the brainstem reticular formation. Simultaneously, an increase in spike activity in the olfactory bulb, the amygdaloid cortico-medial and central nuclei, and the prepyriform cortex occurred. Acoustic and photic stimuli and a jet of air produced similar activation in the neocortical regions and the brainstem reticular formation along with an increase in spike activity in the structures of the olfactory analyzer. Olfactory stimuli (acetone, benzol, fennel oil) depressed spike activity in the olfactory structures when the neocortex and brainstem reticular formation had been activated. (English summary) (22 ref.).—*I. D. London.*

Neuroanatomy

LESIONS

4310. Fields, Thomas A., et al. (Washington State U.) **Apparatus and training program for studying immediate effects of retinal damage in the rhesus**

monkey (Macaca mulatta). *USAF ARL Technical Report*, 1969(Dec), Vol. 69-18, 20 p.—Developed apparatus and training techniques to prepare 6 rhesus monkeys for a study of the immediate effects of retinal damage upon visual acuity. Ss were trained to perform a discrimination task involving punishment and avoidance procedures. Stimuli were 2 Landolt rings with the gap-openings oriented to either the right or to the left. 2 response levers were available. Initial training was an avoidance-punishment program but this was not successful. Control was obtained by putting the Ss on a positive reinforcement program with food reward. Once stimulus control was obtained, punishment was introduced and positive reinforcement was gradually eliminated. Using these procedures Ss were trained to a level of 90-100% correct responses in the avoidance-punishment program with stimuli requiring 20/100 visual acuity. Ss were then placed in a head restraint apparatus and viewed the stimuli through tubes. This technique and supporting apparatus allowed the rapid presentation of stimuli to either the left or right eye. The criterion of 90-100% correct responses was maintained under these conditions.—*USAF ARL*.

4311. **Gambaryan, L. S.** (Lab. of Neurobionics, Erevan, USSR) **K morfo-funktsional'noi arkhitekture uslovnogo dvigatel'nogo refleksa.** [On the morphofunctional architecture of the motor conditioned response.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 290-299.—Presents the results of studies on dogs and cats. When dorsal columns were cut or removed over a few spinal segments, previously established motor CRs remained unaffected. Impulses, elicited by exciting afferent fibers of spinal origin in the extremities, continued on to the sensorimotor cortex when all spinal pathways were sectioned except those of the ventrolateral tract. Bilateral transection of the medial lemniscus did not end the ability to execute CRs. Lesion of the medial lemniscus did not interfere with the transmission of impulses to the sensorimotor cortex, elicited by stimulation of the nerves arising in the hindleg muscles. Pyramidal section at the level of the medulla oblongata resulted in only slight disturbance of motor function. Retention of the CRs was in evidence, with only deficiency in the force of the CRs within the 1st postoperative days. Bilateral extirpation of globus pallidus resulted in adynamia and indifference to external stimuli. CRs were retained 12-20 days after extirpation. Neither partial nor total extirpation of the cerebellum interfered with the acquisition and execution of classic defensive CRs. (English summary) (19 ref.)—*I. D. London*.

4312. **Graham, Ernest S., Farrer, Donald N., Mark, Roger G., & Fields, Thomas A.** (Holloman Air Force Base, 6571st Aeromedical Research Lab., Alamogordo, N. M.) **Behavioral assessment of visual functioning immediately after exposure of the eye to a laser.** *USAF ARL Technical Report*, 1970(Mar), No. 70-9, 15 p.—Describes a behavioral program which permits assessment of visual functioning in rhesus monkeys immediately following laser-induced foveal impairment. 6 Ss were trained on a visual discrimination problem involving Landolt rings. Ss received stimuli via viewing tubes to either the right or left eye on a random basis. An equal number of stimuli were presented to each eye. Midway through the behavioral program the right eye was exposed to a neodymium laser. Postexposure

behavioral testing began immediately thereafter. The behavioral data predicted the occurrence of foveal impairment as verified by fundus photographs taken approximately 1 hr. after exposure.—*USAF ARL*.

4313. **Khudorozheva, A. T.** (Pavlov Inst. of Physiology, Leningrad, USSR) **Osobennosti vosstanovleniya dvigatel'noi funktsii posle deafferentsatsii u sobak v ontogeneze.** [Features of the restoration of motor functions after deafferentiation in dogs in ontogenesis.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 308-320.—7 1-3.5 mo. old puppies were Ss in a study of the mechanism involved in compensatory adaptability at different periods of postnatal ontogenesis when the hindleg had been deafferentiated by unilateral section of the posterior roots (L_5-S_2) proximally from the spinal ganglia. The operation led to functional changes in the CNS. CR motor-defensive reactions were utilized with simultaneous recordings of the movements of the deafferentiated and intact limbs. Serving as another criterion of the character of the operatively induced impairment of the deafferentiated limb and also of the speed and degree of its functional restoration were the rhythmic motor reactions of the deafferentiated limb due to stimulation of the intact limb, utilizing current with different rhythms of application. Showing the functional deficiency of the deafferentiated limb was its earlier inclusion in CR motor activity and the appearance of rhythmic activity in synchrony with the rhythm of stimulation of the intact limb (observed only in the range of slow rhythms). Quickening of the rhythm led to impairment of the rhythmic performance of the deafferentiated limb. Cessation of deafferentiated limb motor activity when CSs and UCSs were acting occurred earlier for those Ss which underwent operation before 3 mo. of age. The stability and degree of functional readjustment in the younger group are held to be connected with the high plasticity of the nervous processes, thanks to which, along with partial restoration of sensitivity of the deafferentiated limb, a gradual decline of its reactivity to stimulation was observed. (22 ref.)—*I. D. London*.

4314. **Khudorozheva, A. T.** (Pavlov Inst. of Physiology, Leningrad, USSR) **Rol' afferentnoi impul'satsii v reflektornoi deyatel'nosti u sobak v ontogeneze.** [Role of afferent impulsation in the reflex activity of dogs in ontogenesis.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 297-307.—10 1-3 mo. old puppies, with unilateral section of the posterior roots (L_5-S_2) proximally from the spinal ganglia, were Ss in a study to establish the dynamics of restoration of the locomotor and autonomic functions of the affected left hindleg. The deafferentiated hindleg exhibited (a) movements in synchrony with breathing, (b) a tendency toward straightening, and (c) the cross-extensor reflex. Age-specific differences occurred in the appearance and subsequent disappearance of these changes, lasting 1-3 mo. for the younger Ss and 4-6 mo. for the older Ss. Fuller restoration occurred in the former than in the latter group. In 5-6 mo. the compensatory process in the older group reached a level of restoration which stabilized with the development of irreversible structural changes in the posterior horns of the spinal cord. Autonomic changes were reflected in the presence of differences in temperature between the deafferentiated and intact limbs, being $.5-2^\circ\text{C}$ higher in the former for 30-40 postoperative days. A decline of temperature to the level of the intact limb paralleled the gradual

restoration of locomotor functions. (22 ref.)—*I. D. London.*

4315. Obratsova, G. A. (Pavlov Inst. of Physiology, Leningrad, USSR) *Izmeneniya uslovnoreflektornoi deyatel'nosti v rezul'tate udaleniya v rannem vozraste zritel'nykh retseptorov.* [Changes in conditioned-response activity as the result of removal of the visual receptors at an early age.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 255-264.—18 rabbits, enucleated at 3-5 days of age, were Ss in a study to determine the changes in subsequent CR activity, and UCR motor activity in the manifestations of CR activity in the blinded Ss. Beginning from the 3rd 5th mo. either a sharp decrease in mobility or an increase in motor activity appeared. Both types of changes bore a stable character and were retained a long time. Changes in general behavior were also reflected in CR activity. In slow inactive Ss shaking CRs were formed with difficulty and CR activity was distinguished by its low level. In active Ss, together with the rapid elaboration of CRs, their high level was observed along with all elements of "analytico-synthetic activity" inherent in intact Ss of the same age. It is suggested that these individual differences are connected with differences in the typological properties of the nervous system which undergo sharp intensification in cases of enucleation. (21 ref.)—*I. D. London.*

4316. Randall, Walter & Parsons, Virginia. (U. Iowa) **Thyroidectomy produces abnormal grooming behavior in cats.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 268-269.—Cats with midbrain lesions exhibit an abnormal dissociation between appetitive and consummatory grooming behaviors and some signs of hypothyroidism. To determine if a hypothyroid state causes the abnormal dissociation, 6 adult male cats were thyroidectomized and their behavior monitored. The thyroidectomized Ss exhibited the same abnormal dissociation in grooming behavior as did 14 Ss with midbrain lesions. However, certain considerations, including the latency and time course of the thyroidectomized-induced changes, suggest that the hypothyroid state is not directly involved, but rather brings about other endocrine and metabolic changes that are involved in the production of the behavioral abnormality.—*Journal abstract.*

4317. Schultz, Ronald & Norberg, Marty. (San Jose State Coll.) **Effects of visual loss on toad, *Bufo boreas*, activity.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 987-990. 15 blinded Western toads, *Bufo boreas*, exhibited significantly less closed-field locomotor activity than 15 with normal vision. It was postulated that this decrease in activity was due to the S's lack of an optimum arousal level.—*Journal abstract.*

Brain Lesions

4318. Jonason, Kim R. & Enloe, Linda J. (State U. New York, Upstate Medical Center, Syracuse) **Alterations in social behavior following septal and amygdaloid lesions in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 286-301.—Subjected 144 male hooded Long-Evans rats, which had previously been tested for social cohesiveness in the open field, to either septal, amygdaloid, or control lesions, and then retested for social attraction. Septal lesions produced dramatic and persistent increases in social cohesiveness, while amygdaloid lesions equally

dramatically reduced social cohesiveness. When an S which had sustained a septal lesion was paired with an amygdalotomized S, their social attraction scores were almost identical to those of paired control-operated Ss. Pairs consisting of septal and control Ss displayed slightly elevated cohesiveness scores compared with paired control Ss, while pairs consisting of amygdaloid and control Ss displayed substantially reduced cohesiveness scores. (23 ref.)—*Journal abstract.*

4319. Kelsey, John E. & Grossman, Sebastian P. (Chicago) **Nonperseverative disruption of behavioral inhibition following septal lesions in rats.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 302-311.—Examined the effect of septal lesions in 2 experiments with 12 and 16 male Sprague-Dawley rats. Lesioned Ss did not inhibit responding as well as controls on a modified DRL schedule unless an exteroceptive cue indicating the termination of the required interresponse delay was provided. However, the lesioned Ss did not inhibit behavior efficiently in a discriminated free-operant avoidance paradigm when responding prior to the presentation of such a cue was not punished. Since Ss received no operant training prior to the introduction of the final response contingencies, the disinhibitory deficits are concluded to be due to an inability to inhibit punished behavior in the absence of an exteroceptive cue and/or to a general change in incentive motivation. (18 ref.)—*Journal abstract.*

4320. Trafton, Clinton L. & Marques, Paul R. (Arizona) **Effects of septal area and cingulate cortex lesions on opiate addiction behavior in rats.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 277-285.—60 Sprague-Dawley albino rats were given bilateral lesions in the septal area or cingulate cortex and then subjected to a regimen previously shown to produce drug addiction in animals. The addiction was indexed by a learned preference for a bitter morphine HCl solution. Ss were tested for relapse following a 2-wk withdrawal of drugs. Bilateral anterior cingulate cortex lesions resulted in a decrement in both the acquisition and retention (relapse) of drug-oriented behavior. Bilateral septal lesions produced no changes in addiction behavior. Further tests with 20 Ss indicated that the results apparently were not due to any effects of cingulate cortex lesions on reactions to the bitter taste of morphine HCl. (16 ref.)—*Journal abstract.*

Brain Hypothalamic & Hippocampal Lesions

4321. Gromova, F. A. (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Funktsional'naya sistema i khimicheskaya geterogennost' voskhodyashchikh vliyaniy gipotalamusa na kory golovnogo mozga.** [Functional system and chemical heterogeneity of ascending hypothalamic influences on the cerebral cortex.] In V. V. Barm (Ed.), *Sovremennaya organizatsiya fiziologicheskikh funktsii*. (See PA Vol. 44:4609) 302-310.—Studied the effect of stimulation and coagulation of various regions of the hypothalamus upon spontaneous and evoked cortical activity with unanesthetized cats and rabbits as Ss. High-frequency (40-300 cps) stimulation of most hypothalamic regions elicited the arousal reaction and decreased the response evoked by photostimulation in the visual cortex. Low-frequency (3-6 cps) stimulation of the same hypothalamic structures elicited the appearance of slow waves and increased the response evoked by photostimulation

Hypothalamic destruction was followed by EEG synchronization, whose degree varied with the hypothalamic structure involved. The serotonergic nature of the ascending influences of the medial structures of the anterior and middle hypothalamic regions on the cortex was established. The chemical heterogeneity of the hypothalamus is discussed in the light of Anokhin's views concerning the biological specificity of the ascending influences of the hypothalamus on the cortex. (English summary) (28 ref.)—*I. D. London.*

4322. Singh, Devendra. (U. Texas) **Sex differences in obesity and food-directed activity in normal and hyperphagic rats.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 306-308.—Compared 23 age-matched male and female Holtzman albino rats with lesions in the ventromedial hypothalamic area for food consumption as a function of fixed-ratio schedule and palatability of food. 12 sham-operated Ss served as controls. Results show marked sex differences in obesity: female lesioned Ss gained significantly more body weight than did male lesioned Ss. However, sex differences in hyperphagia were evident only when regular food was available and could be obtained at lower ratio schedules. Finally, unlike normal rats, no sex differences were evident for sucrose consumption in lesioned Ss.—*Journal abstract.*

4323. Spies, Gordon. (Indiana State U.) **Hypothalamic hyperphagia: Loss of weight through voluntary exercise.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 257.—Housed 6 hypothalamic hyperphagic female Long-Evans hooded rats in activity cages for periods ranging from 14-28 days. 5 Ss lost weight during the period, and rate of gain of the 6th was sharply attenuated. On return to their home cages, Ss' weight gain returned to above-normal levels. It is suggested that in a free environment the static phase of hypothalamic hyperphagia might not be attained and that it is an artifact of the manner in which the Ss are housed.—*Journal abstract.*

4324. Wampler, Richard S. (Kansas State U.) **Regulatory deficits in rats following unilateral lesions of the lateral hypothalamus.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 190-199.—Investigated deficits in regulatory behaviors following unilateral lesions of the lateral hypothalamus (LH) using 30 hooded and 8 albino female rats. Ss with unilateral damage to LH were aphagic and adipsic briefly, showed deficits in ability to respond to glucoprivation, and drank little water when food deprived. Ss showed normal drinking following hypertonic saline injections. A 2nd group of 8 Ss had similar LH damage and additional damage to the region of the fornix ahead of the ventromedial nucleus. Although this group showed some deficits in regulatory behaviors, Ss did not differ significantly from 5 Ss with minimal brain damage. Results suggest that 1 LH area cannot maintain regulatory behaviors, but damage to other areas can block the effect of unilateral LH lesions.—*Journal abstract.*

BRAIN STIMULATION

4325. Bureš, J. & Burešová, O. (Inst. of Physiology, Prague, Czechoslovakia) **Primenenie rasprostranyayushcheisya depressii v tselyakh izucheniya funktsional'noi organizatsii tsentral'noi nervnoi sistemy.** [The use of spreading depression for purposes of studying the functional organization of the central

nervous system.] In S. P. Narikashvili (Ed.), "Korkovaya regulyatsiya deyatelnosti podkorkovykh obrazovaniy golovnoy mozga." (See PA, Vol. 46:Issue 2) 116-131.—Unanesthetized curarized rats were used to study the remote effects of Leao's spreading depression on (a) spontaneous and evoked EEG activity, and (b) single neuronal activity in structures not directly invaded by spreading depression. During cortical spreading depression, the ipsilateral thalamus, hypothalamus, and caudate nucleus were severely depressed while the reticular formation was activated. The hippocampus was influenced intermediately. Striatal spreading depression reduced thalamic activity, but influenced very little the neocortex and the reticular formation. Striatal spreading depression interrupted the pyramidal and thalamocortical pathways. Thalamic spreading depression produced deafferentation of the cerebral cortex and decreased cortical, striatal, and hypothalamic activity without much affecting the reticular formation and hippocampus. It is concluded that long-distance connections between nerve centers are predominantly excitatory, while inhibitory mechanisms are mainly local in character (recurrent inhibition). Spreading depression may be used as a method of "inhibitory neuronography" to establish the character and intensity of the mean tonic influence exerted by a depressed area on the other intact centers. (English summary) (2 p. ref.)—*I. D. London.*

4326. Ito, M. & Olds, J. (California Inst. of Technology, Div. of Biology) **Unit activity during self-stimulation behavior.** *Journal of Neurophysiology*, 1971(Mar), Vol. 34(2), 263-273.—Measured the effect of self-stimulation on the neuronal activity in albino rats, in terms of the firing rate during stimulation periods as compared to that during nonstimulation intervals. In the cingulate region there was facilitation and driving, and in the hippocampus there was inhibition. It is concluded that axons or collaterals of the fibers whose stimulation was rewarded project to the anterior cingulate region and there exercise a profound influence on the hippocampal activity.—*G. Westheimer.*

4327. Van Der Meulen, J. P. & Ghez, C. (Western Reserve U., Medical School) **The effects of stimulation of the cerebral cortex on alpha and gamma motor units in cat hindlimb.** *Archives Italiennes de Biologie*, 1970(Dec), Vol. 108(4), 538-563.—Stimulation of the pericruciate area in cats under pentobarbital-chloralose anesthesia produced responses in motor units of nerves to hindlimb flexors that were of equal latency on the 2 sides; gamma responses had lower thresholds and longer latencies than alpha units. Lesion studies demonstrated that no 1 corticospinal system is responsible. Only gamma responses remained after hemisection of the cord on the side of the recording, suggesting that propriospinal fibers provide a differential input to these units.—*W. A. Wilson.*

Chemical Stimulation

4328. Burešová, Olga; Bureš, Jan. & Rustová, Milena. (Czechoslovak Academy of Sciences, Inst. of Physiology, Prague) **Conditions for interhemispheric transfer of initially lateralized visual engrams in hooded rats.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 200-205.—After 5 days of monocular overtraining of a horizontal-vertical discrimination in male hooded rats, 1 hemicortex was functionally eliminated by cortical spreading depression

(CSD). Retention tested with the hemisphere ipsilateral or contralateral to the trained eye revealed 0 or 90% savings, respectively. Binocular experience (retraining to criteria of 3/3 or 12/13 trials) between the monocular overtraining and retention testing under unilateral CSD did not change the above relationship. However, monocular overtraining followed by retraining with the untrained eye to the given criteria or to the 12/13 criterion 5 times improved the secondary trace to 46, 55, or 72% savings, respectively. It is proposed that interocular transfer starts with transcommissural readout which initiates a transcommissural write-in process rapidly improving the duplicate trace in the untrained hemisphere. (16 ref.)—*Journal abstract.*

4329. Shumilina, A. I. (Inst. of Normal & Pathological Physiology, Moscow, USSR) *Dinamika izmenenii vyzvannykh potentsialov na svet v kore i podkorkovykh obrazovaniyakh pri aplikatsii kholinergicheskikh i adrenergicheskikh veshchestv na koru golovnogo mozga.* [Dynamics of changes in evoked potentials in response to light in the cortex and subcortical structures when cholinergic and adrenergic agents are applied to the cerebral cortex.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 258-269.—8 awake rabbits with chronically implanted electrodes were Ss in the study which employed acetylcholine and adrenaline as cholin- and adrenergic agents, respectively. Results show that the direct action of adrenaline on the cerebral cortex produced entirely different changes in evoked potentials to light flashes than acetylcholine, beginning from local short-term facilitation of both phases of the primary response and the complete suppression of the late slow wave at the point of application of adrenaline—evidence for the different neurochemical nature of the mechanisms of generation of these components. These and other data show that in the same cortical point the synaptic organizations, participating in the generation of evoked potentials in response to a light flash, may be considered as involving both cholin- and adreno-reactive structures which selectively promote a corticofugal influence upon appropriate subcortical structures and transcallosal structures in the cortex of the contralateral hemisphere. (English summary) *J D London.*

Electrical Stimulation

4330. Flynn, John P., Edwards, Stephen B., & Bandler, Richard J. (Yale U., Medical School) *Changes in sensory and motor systems during centrally elicited attack.* *Behavioral Science*, 1971(Jan), Vol. 16(1), 1-19. Hypothesized that sensory and motor systems are readied to act in specific ways under the influence of electrical stimulation of the brain that induces attack behavior. In a number of experiments with cats, more lunges were directed towards a mouse presented to the eye contralateral to the side of the hypothalamus by stimulated. The visual system was also gated by hypothalamic stimulation. A bite ensued in some instances after section of the trigeminal nerve, but not in others. After the successful Ss were blindfolded they no longer bit. The tactile system around the mouth and lips was similarly influenced by hypothalamic stimulation. Reflexes became functional under the influence of stimulation. It is concluded that in the case of attack

behavior, the organism's sensory and motor systems are primed to bring about patterned reflexes, which constitute at least in part the overt behavior when suitable stimuli are present in the environment.—*Journal abstract.*

4331. Frederickson, C. J. & Hobson, J. A. (Harvard Medical School, Boston, Mass.) *Electrical stimulation of the brain stem and subsequent sleep.* *Archives Italiennes de Biologie*, 1970(Dec), Vol. 108(4), 564-576.—Compared the effects of 3 hr. of stimulation in or near the nucleus reticularis pontis (in which EEG desynchronization was maintained) and 3 hr. of sleep deprivation without such stimulation in cats. Latency to slow-wave sleep, and total amount of slow wave sleep and waking were unaffected, but periods of uninterrupted slow-wave sleep were longer and more frequent after stimulation. Stimulation produced a lower latency to paradoxical sleep and an increase in total amount. The results are considered to be evidence against the passive reticular deactivation theory of sleep.—*W. A. Wilson.*

4332. Gadzhieva, N. A. (Academy of Sciences of the Azerbaidzhan SSR, Baku, USSR) *Vliyaniye kory bol'shikh polushariy na vyzvannyye potentsialy v razlichnykh strukturakh zritel'nogo analizatora.* [Influence of the cerebral cortex on evoked potentials in different structures of the visual analyzer.] In S. P. Nankashvili (Ed.), "Korkovaya regulatsiya deyatelnosti podkorkovykh obrazovaniy golovnogo mozga." (See PA, Vol. 46:Issue 2) 289-305.—In chronic experiments on rabbits, recordings were made of the electroretinogram (ERG) and the evoked potentials of the cortex lateral geniculate body, and superior colliculus. Rhythmic electrical stimulation of the visual cortex and the sensorimotor cortex resulted in a pronounced depression of responses in the lateral geniculate body and superior colliculus, evoked by light flashes. The b wave in the ERG was also depressed, but at higher intensities of cortical stimulation than for the responses of the lateral geniculate body and superior colliculus. Lateral geniculate body evoked potentials were the most sensitive to cortical stimulation, since they were depressed at the lowest intensity of stimulation. In all cases, the degree of depression of evoked potentials was more marked and complete at the higher levels of the afferent pathway than at the lower levels, and occurred with lesser intensity of cortical stimulation. Both the positive and negative phases of the responses were depressed, with reduction of the latter being the more prominent. The facilitative influence of cortical stimulation on lateral geniculate body and superior colliculus evoked potentials and on the ERG was observed only after cessation of cortical stimulation. The influence from the visual cortex was greater than that from the sensorimotor cortex. During prolonged stimulation of the sensorimotor cortex a progressive "escape" of subcortical responses was observed. The influence of the visual cortex and sensorimotor cortex continued after aminazine (chlorpromazine) and amylal depression of the activity of the adreno- and cholinoreactive substrates of the reticular formation. The influence from the visual cortex was enhanced while that from the sensorimotor cortex remained unchanged or decreased. The data suggest the existence of corticofugal influence via the corticohypothalamic pathways and the brainstem reticular formation. (English summary) (59 ref.) *J D London.*

control of tonic vibration reflex. *Journal of Neurophysiology*, 1971(Mar), Vol. 34(2), 302-309.—Repetitive electrical stimulation of the lower pontine reticular formation and the lateral vestibular nucleus augmented the tonic vibration reflex in the anesthetized or decerebrate cat triceps muscle bilaterally, while stimulation of the medial part of the medullary reticular formation facilitated it.—*G. Westheimer.*

4334. **Golden, George H. & Lubar, Joel F.** (U. Tennessee) **Effect of septal and fimbrial stimulation on auditory and visual cortical evoked potentials in the cat.** *Experimental Neurology*, 1971(Mar), Vol. 30(3), 389-402.—Recorded cortical responses from the ectosylvian and marginal gyri, respectively, with both acutely and chronically implanted electrodes in 11 adult cats. After all recordings were completed, lesions were made in the septum in 3 Ss and both auditory and visual cortical evoked potentials (CEPs) were again studied. Depending on the location within the septum, septal stimulation in acute preparations either attenuated or facilitated both auditory and visual CEPs; stimulation of the fimbria had a facilitatory effect. With chronically implanted electrodes, septal stimulation led to decreases and fimbrial stimulation to increases in evoked response amplitudes. Certain effects were reversed after placement of the lesion: (a) auditory and visual CEPs attenuated by septal stimulation were facilitated, and (b) fimbrial stimulation resulted in the attenuation of CEPs. Findings implicate the septum and fimbria in processing sensory information and give evidence that a uniprocess concept of septal functioning is no longer adequate. (19 ref.)—*Journal abstract.*

4335. **MacLean, P. D., Reeves, A. G., & Yokota, T.** (National Inst. of Mental Health, Bethesda, Md.) **Reaktsii neironov gippokampa pri vnutrikletочноi registratsii u bodrstvuyushchikh obez'yan (Saimiri sciureus) i problema obuslovlivaniya na urovne staroi kory.** [Intracellular recording of the reactions of hippocampal neurons in awake monkeys (Saimiri sciureus) and the problem of evocation at the archicortical level.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 358-363.—Intracellular recordings of 75 hippocampal neurons and extracellular recordings of 82 hippocampal neurons in 13 awake squirrel monkeys were made. Electrical stimulation was applied to the septal and olfactory pathways, which may be viewed as representative of inputs from intero- and exteroceptive systems. Stimulation of the septum and olfactory bulbs was found to be effective in causing graded excitation of hippocampal neurons with the significant difference that only in response to septal stimulation did depolarizing postsynaptic potential lead to the emergence of cellular discharges. (English summary)—*I. D. London.*

4336. **Makarenko, Yu. A.** (1st Medical Inst., Moscow, USSR) **Osobennosti tsentral'nykh mekhanizmov vegetativnykh reaktsii pri samorazdrazhenii.** [Features of the central mechanisms of the autonomic reactions in self-stimulation.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 52-58.—6 dogs with electrodes implanted in different points of the hypothalamus were Ss in a study to determine whether (a) positive and negative reactions are specifically expressed in the autonomic processes, and (b) a correlation exists between the autonomic (peripheral) and central processes. Electrical stimulation of the positive structures induced

parasympathetic reactions (bradycardia, salivation, increased gastric motility, etc.)—effects observed simultaneously or in different combinations. Reverse reactions appeared after stimulation of negative zones. The autonomic responses exhibited a sympathetic character (tachycardia). The EKG and other autonomic indices reflected the quality and level of motivation, with stimulation of positive zones bringing about a partial decrease in motivation and of negative zones presumably an increase. The character of the autonomic effects emerging from self-stimulation makes it appear that action on the positive zones of the brain simulates various "fragments of natural reinforcement." (English summary)—*I. D. London.*

4337. **Phillips, A. G., Morgan, C. W., & Mogenson, G. J.** (U. British Columbia, Vancouver, Canada) **Changes in self-stimulation preference as a function of incentive of alternative rewards.** *Canadian Journal of Psychology*, 1970(Aug), Vol. 24(4), 289-297.—Tested 24 male Wistar rats on a 23-hr food and water deprivation schedule for preference between lever pressing for electrical stimulation of the lateral hypothalamus and liquid rewards, which varied in taste and caloric content. Preference for self-stimulation diminished as the alternative liquid became more palatable: with a saccharine-glucose solution as the alternative, Ss showed an equal preference for hypothalamic stimulation and the liquid reward. In longer 6-hr tests, Ss deprived of water for 24 and 48 hr. initially showed a preference for self-stimulation over water but eventually satisfied their water deficit by pressing for water. Neglect of physiological needs during self-stimulation appears to be more a function of the alternatives available and the length of the test session than intrinsic properties of the brain stimulation. (French summary) (15 ref.)—*Journal abstract.*

ELECTRICAL ACTIVITY

4338. **Daniel, Jozef.** (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Effect of various degrees of mental load on activation level.** *Studia Psychologica*, 1970, Vol. 12(4), 266-270.—Various degrees of mental load consisting of reading Stroop's subtests and panel monitoring were followed simultaneously with activation level by basic GSR being recorded in 35 Ss (15 undergraduates and 20 operators). An analysis of GSR curves failed to reveal any significant differences between various degrees of load despite a marked variability of activity in individual Ss. Results are in agreement with literary data. GSR curves seem to be suitable, before all else, for a qualitative analysis. (Czech & Russian summaries)—*Journal abstract.*

4339. **Fadeev, Yu. A.** (1st Medical Inst., Moscow, USSR) **Teoriya funktsional'noi sistemy kak osnova dlya izucheniya mekhanizmov zamykaniya uslovnogo refleksa.** [The theory of the functional system as basis for the study of the mechanisms of conditioned response closure.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 404-411.—In 16 urethanized cats, extracellular recordings were made of the reactions of 43 cortical neurons (26 in the visual projection and 17 in the somatosensory areas) to a CS (light flash) and a UCS (pain), applied in a definite sequence. Data indicate that neuronal responses to photic and nociceptive stimuli

ongoing wave processes of the EEG in subcortical and cortical sites during natural sleep and sodium-pentobarbital-induced anesthesia, is reported and compared with previous similar studies on man where electrodes had been introduced for purposes of either diagnosis or treatment. 4346. Buchsbaum, Monte; Silverman, Julian; Henkin, Robert L., & Pfefferbaum, Adolf. (National Inst. of Mental Health, Bethesda, Md.) **Contrast effects on the auditory evoked response and its relation to psychophysical judgments.** *Perception & Psychophysics*, 1971(Apr), Vol. 9(4), 379-384.—Used an auditory average evoked response (AER) procedure to search for a physiological counterpart of the contrast effect—the tendency for an S's judgment of the intensity of a stimulus to be modified by the intensity of prior stimulation. Ss were 10 male and 10 female 18-22 yr. old paid normal volunteers. When a tone was preceded by a softer tone, its AER amplitude increased; conversely, when a tone followed a louder tone, amplitude decreased. Irregular intervals between tones decreased the AER contrast effect, as did increasing the interval between tones. Significant correlations found between individual scores on the AER contrast procedure and performance on a battery of psychophysical tasks are discussed. (34 ref.)—*Journal abstract.*

4347. Giannitrapani, Duilio. (Michael Reese Psychosomatic & Psychiatric Inst., Chicago, Ill) **Scanning mechanisms and the EEG.** *Electroencephalography & Clinical Neurophysiology*, 1971(Feb), Vol. 30(2), 139-146.—Examined EEG recordings of 32 11-13 yr. old right-handed males under 8 conditions. Findings indicate that beta activity increases as long as a condition exists in which the stimulus, whether internal or external, requires structuring activity on the part of the organism. It is suggested that there is a hierarchy of scanning mechanisms beginning with alpha activity scanning for any stimulation. Its function ceases or subsides in the presence of a broad range of percepts, whether internal or external. At this point in the perceptual cycle, faster scanning mechanisms occur, such as beta activity in the temporal areas, scanning for structure. This activity subsides just as alpha activity does when the conditions for its existence are no longer present. Beta activity disappears when the stimulus has acquired the necessary structure. The existence of faster mechanisms to mediate even more complex processes is discussed. (French summary) (15 ref.)—*Journal summary.*

Amplitude was less when stimuli were

alternated between the 2 senses. The alpha index and integrated EEG were closely correlated. As alpha index rose, cardiac frequency declined.—*R. W. Husband.*

4351. Ludlam, William M., Cohen, Stanley, & Ludlam, Diana P. (Optometric Center of New York, N.Y.) **The visual evoked response: A new tool in vision research.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Jul), Vol. 47(7), 505-519.—The minute electrical discharges which occur in the visual cortex upon brief stimulation of the eye by light can be monitored by topical scalp electrodes and, aided by computer summation techniques, their waveform can be extracted and displayed for study. Various factors, both external and internal to the human S, have been shown to influence the character of a given response. The visual evoked response (VER) has already been employed in laboratory investigations of such varied visual factors as amblyopia, color vision, intensity-time relationships, metaccontrast, dark adaptation, and foveal characteristics. A relationship between the contrast of borders in the retinal image and the character of a specific temporal portion of the VER has been recently reported by M. R. Harter and C. T. White. This discovery may make possible the development of an objective, nonverbal clinical test for refractive status. (74 ref.)—*Journal abstract.*

4352. O'Steen, W. Keith & Anderson, Kenneth V. (Emory U.) **Photically evoked responses in the visual system of rats exposed to continuous light.** *Experimental Neurology*, 1971(Mar), Vol. 30(3), 525-534.—Studied the effect of light on the photoreceptors of 8 adult albino rats exposed to constant illumination and a control group of 9 Ss exposed to cyclic light. The cells in the retina selectively degenerated after exposure to continuous, low intensity, fluorescent illumination, while cyclic light had no effect. Damage could be detected during the 1st 4 days and, after 30 days of exposure, normal receptors were completely absent. The pigment cell layer and the innermost layers of the retina were not damaged. The characteristics of photically evoked potentials in the optic tract, lateral geniculate nucleus, and visual cortex of the experimental Ss were examined. Evoked responses after 4 days of light varied according to the recording site and were typically of low amplitude and had long latencies of onset. Only responses of low amplitude and with long latencies were recorded after 14 days, and no photically evoked potentials could be recorded from the optic tract and lateral geniculate nucleus. Similar responses were recorded after 30 days, although, more commonly, no potentials could be evoked by flash stimuli. It is concluded that the limited retinal degeneration described provides a model for examining visual function in the absence of photoreceptor cells in the retina, but without apparent damage to other cellular components of the system.—*Journal abstract.*

4353. Sato, Kensuke, et al. (Nagasaki U., Medical School, Japan) **Cerebral visual evoked potentials in relation to EEG.** *Electroencephalography & Clinical Neurophysiology*, 1971(Feb), Vol. 30(2), 123-138.—Compared rhythmic algebraic summations of visual evoked potentials (VEPs) to single flash stimuli with averaged evoked responses elicited by rhythmic flash stimuli of the same frequencies as those of the summations in 12 human adults. Each of the main components in the average VEP to single flash was increased by summation at intervals corresponding to delta, theta, and alpha frequencies, whereas they were decreased by that at

intervals corresponding to beta frequencies. By summation and stimulation at a frequency corresponding to the alpha frequency range, deflections other than the 2nd surface negative (N_2) and 3rd positive (P_3) deflections in the VEP were fused or synchronised respectively to the N_2 and P_3 deflections to build up an enhanced surface negative-positive diphasic (alpha rhythm-like) configuration. By further increase in the frequencies of the summation and stimulations, the diphasic pattern deteriorated to form a small amplitude fast pattern. At frequencies higher than 12/sec, occlusive (negative interactive) effects between adjoining flashes of light in the photic stimulation were noted. New findings obtained from the contour maps created by drawing equipotential lines for both the rhythmically driven and summed VEPs in relation to the frequency of the stimulation and summation are outlined. (French summary) (42 ref.).—*Journal summary*.

4354. Volokhov, A. A. & Pisareva, N. L. (Inst. of the Brain, Moscow, USSR) **Evolutsiya vyzvannykh otvetov kryshi srednego mozga na svetovye razdrazheniya u ptits v rannem ontogeneze.** [Evolution of evoked responses in the roof of the midbrain to photic stimulation in birds in early ontogenesis.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 127-133.—Evoked responses to single flashes were recorded in 15-21 day old chick embryos and in 1-30 day old chickens from the dorsal surface of tectum opticum. The evoked response appeared at the 18th incubational day as a negative or a negative-positive wave, in which the amplitude of the negative component exceeded by far the amplitude of the positive wave. In the process of pre- and postnatal ontogenesis definite changes in the main parameters of the evoked response were shown to occur. The latent period of the evoked response and the duration of the chief negative component were demonstrated to undergo the most distinct and regular changes. In the process of individual development, changes were observed in the configuration of the evoked response of tectum opticum. This change consisted of a decomposition of the negative wave into 2 teeth. However, contrary to the case in mammals, the evoked response in birds remained negative-positive without initial positiveness throughout the whole process of development. (English summary) (24 ref.).—*J. D. London*.

4355. White, Carroll T. & Bonelli, Leonard. (U.S. Naval Electronics Lab. Center, San Diego, Calif.) **Binocular summation in the evoked potential as a function of image quality.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Apr), Vol. 47(4), 304-309.—Obtained evoked cortical potentials under monocular and binocular viewing conditions, with image quality and flash intensity as experimental variables, using 3 adult males as Ss. Results show that the degree of binocular summation obtained was directly related to the quality of the image presented to the 2 eyes. A complex interaction was indicated between sharpness of focus and flash intensity, with the higher degree of binocular summation being obtained with high flash intensities when defocused patterns were used. Results suggest that the most unequivocal results will be obtained with the use of low to medium flash brightnesses.—*Journal abstract*.

4356. Yoshii, N., Miyamoto, K., Shimokochi, M., & Hayase, S. (Osaka U., Medical School, Japan) **Izuchenie elektroentsefalograficheskikh izmenenii spetsificheskikh dlya opredelennogo tipa povedeniya,**

i neuronal'nykh mekhanizmov uslovnoreflektornogo povedeniya. [Study of electroencephalographic changes, specific for a definite type of behavior, and the neuronal mechanism of conditioned response behavior.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 319-338. Ss were 5 dogs with implanted cortical and subcortical electrodes. Behavior-specific localization of EEG changes prior to CR formation (alimentary instrumental reflex, defensive classical CR, avoidance instrumental reflex) was demonstrated by applying low-frequency electrical stimulation to intracerebral structures and analyzing the EEG responses continuously. The sensorimotor cortex proved indispensable for conditioning motor reflexes. In alimentary bar-pressing EEG changes in response to the CS prior to the CR usually appeared in the cortex and less often in the subcortical structures. However, extensive areas in the cortical and subcortical structures were involved in the defensive CR and in avoidance bar-pressing. The intracerebral stimulus became effective in inducing marked responses in the mesencephalic reticular formation, caudate nucleus, and hippocampus when it was properly paired with the CS (food). The cortical and subcortical areas, where EEG activity was changed prior to the CR by the positive CS, were also influenced by procedures inducing internal inhibition (experimental extinction, delayed conditioning, aftereffect of the negative CS). Conditioned limb movement was induced by the conditioned intracerebral stimulation during sleep, though the EMG was very small and the process of differentiation was disturbed. Despite the small peripheral CR, the central CR preceding the peripheral response was conspicuously observed in the frontal cortex during sleep. (English summary) (16 ref.)—*J. D. London*.

SENSORY PHYSIOLOGY

4357. Boernstein, Walter S. (New York U. Research Center for Mental Health) **Optic perception and optic imageries in man: Their roots and relations studied from the viewpoint of biology.** *International Journal of Neurology*, 1967, Vol. 6(2), 147-181.—Based on W. S. Boernstein's theory of specific sensorimotor sense-synergies in perceptual processes and E. M. von Hornbostel's theory of bright-dark perception correlations between sensory and allied motor functions are demonstrated as the basis of the ability to perceive bright-dark sensory stimuli and to experience allied emotions. The additive effect of nonoptic processes on the optic system is described as confirming the Hornbostel-Boernstein theory. The physiological mechanisms underlying the bright-dark process as the root of all perception are considered. The generally accepted theory that stability, constancy, figure-ground organization, and spatial perception are characteristic of all kinds of perception is disputed. Experimental proof is provided that perception may still occur without any 1 of these properties. It is concluded that an understanding of the basic facts of perception in man is possible only by tracing them back to their development during phylogenesis. (Spanish, French, & German summaries) (77 ref.).—*Journal summary*.

4358. Bradley, Robert M. & Mistretta, Charlotte M. (U. Oxford, Nuffield Inst for Medical Research, England) **Intravascular taste in rats as demonstrated by conditioned aversion to sodium saccharin.** *Journal of Comparative & Physiological Psychology*,

1971(May), Vol. 75(2), 186-189.—Injected 128 naive male Sprague-Dawley rats in the tail vein with 1 ml. of sodium saccharin. Ss were exposed to gamma radiation and, 24 hr. later, were given a sodium saccharin vs. water-preference test. As a result of the treatment Ss were aversive to the oral sodium saccharin. Iv injection of sodium chloride followed by radiation produced no aversion to sodium saccharin. Results indicate that rats perceive intravascular sodium saccharin as a saccharin taste, suggesting that there are receptor sites in the tongue which are sensitive to changes in blood constitution, and which may act to monitor the internal chemical environment.—*Journal abstract.*

4359. Pfaff, D. W. & Gregory, E. (Rockefeller U.) **Olfactory coding in olfactory bulb and medial forebrain bundle of normal and castrated male rats.** *Journal of Neurophysiology*, 1971(Mar), Vol. 34(2), 208-216.—Single units were recorded from castrated and normal male rats. Stimuli were urine odors obtained from estrous and ovariectomized female, and normal, castrated, and frightened male rats. Detailed analysis showed that proportions of responding units and differential responses were essentially the same in castrated as in normal male rats.—*G. Westheimer.*

4360. Snyakin, P. G. (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Retseptornye i éffektornye proyavleniya v deyatelnosti analizatorov.** [Receptor and effector effects in analyzer activity.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 58-65.—Adduces materials bearing directly on (a) the problem of self-regulation in the activity of the perceptual organs, and (b) the characteristic traits of their reactions when efferent influences are taken into account. Effector influences on the receptors of any analyzer are very well expressed in the functional lability of the receptor elements, which may be active or inactive depending on quantitative and qualitative changes in stimulation. Optimal receptor sensitivity may be maintained through the influence of CRs and UCRs. Thus, if the S is warned against future cooling, the number of cold points in the skin increases; whereas a warning of future warming brings on an opposite reaction. The accuracy of receptor adjustment to the situation is an important component of analyzer function. Receptors are, accordingly, not passive apparatus, perceiving environmental changes, but are active elements within the general analyzer mechanism—elements consisting of separate units which undergo sequential inclusion and exclusion, mobilization and demobilization in response to changes in the environment. Feedback receptor mechanisms play an undoubted role in self-regulation of the receptor function. (English summary) (25 ref.)—*I. D. London.*

4361. Worden, F. G. (Massachusetts Inst. of Technology, Brookline) **Hearing and the neural detection of acoustic patterns.** *Behavioral Science*, 1971(Jan), Vol. 16(1), 20-30.—Discusses the neurophysiology of perception in terms of hearing and its role in adaptive behavior. The complexity which characterizes sounds of biological significance is contrasted with the emphasis on simple stimuli in the historical development of hearing theories and auditory neurophysiology. The auditory pathway is compared with the visual pathway for the purpose of deriving relationships between its information-processing task and its neurophysiological organization. 2 concepts of the acoustic message are contrasted in relation to the question of how sound inputs

are able to influence behavior. (48 ref.)—*Journal abstract.*

BIOCHEMISTRY

(Hungarian Academy of Sciences, Budapest) **Glutaminsav antagonistázás, illetve adagolás hatásai különböző malatartási folyamatokra.** [Behavioral influences of glutamic acid antagonization and administration respectively.] *Pszichológiai Tanulmányok*, 1968, No. 11, 11-30.—Produced deficiency of glutamic acid in rats by administering 1 of the antimetabolites of glutamic acid, glutamic acid ethylester. Deviations in behavior were observed. The influence of glutamic acid on the deviations of these Ss and on the behavior of untreated Ss was assessed. The experiments involved chronic and acute EEG, conditioning, maze-running, and observation of orientation. Selective elimination of glutamic acid from the metabolism of the nervous system has been found to produce differences in EEG, learning, and behavior. In the course of parenteral administration of glutamic acid, the symptoms characteristic of its absence were eliminated. A stimulating effect on normal Ss could be observed in regard to their learning achievement and motor activity. (Russian summary) (48 ref.)—*English summary.*

4364. Kleban, Morton H., et al. (Philadelphia Geriatric Center, Gerontological Research Inst., Pa.) **Neurochemical changes in brains of albino rats resulting from avoidance learning.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 3-13.—Observed the effects of avoidance training on the brain chemistry of trained rats. 36 Wistar female albino rats were run in an automated straight-runway maze. 12 Ss received limited avoidance training followed immediately by extinction training for avoidance response. 12 other Ss received limited avoidance training only, and 12 Ss acted as nontrained controls. Following training, each S's brain was removed, and chemical analyses for RNA, protein, and total nitrogen were performed. Significant increases in cerebrum, brainstem, and cerebellum RNA were found for both trained groups. Such differences in RNA were strongly present in the brainstem and cerebrum but were nonsignificant for the cerebellum. Brain protein showed significant increases as a result of the interaction of cerebellum with avoidance training. Total nitrogen levels were unaltered. 2 significant correlations obtained between neurochemistry and behavior: a 0-order correlation between brainstem RNA and extinction behavior and a multiple correlation among brainstem RNA, cerebral protein, and extinction behavior. Hormones

4366. Evans, J. L., MacLean, A. W., Ismail, A. A., & Love, D. (U. Edinburgh, Sleep Lab., Scotland) **Con-**

centrations of plasma testosterone in normal men during sleep. *Nature*, 1971(Jan), Vol. 229(5282), 261-262.—Examined the relationship between sleep and concentration of plasma testosterone by taking samples from 5 adult male Ss during sleep. All Ss showed evidence of an overall increase in plasma testosterone during sleep. "Peaks of testosterone occurred in conjunction with or adjacent to periods of REM sleep . . . Arousal and sudden shifts towards arousal were also often associated with an increase in plasma testosterone." It is felt that this relationship "suggests a link between the neurophysiological state underlying REM sleep and the mechanism regulating the production of testosterone."—S. Appelle.

4367. Levine, Seymour. (Stanford U., Medical School) **Stress and behavior.** *Scientific American*, 1971(Jan), Vol. 224(1), 26-31. Summarizes several studies investigating possible roles of the pituitary-adrenal system in the regulation of behavior. ACTH and adrenal hormones affect learning, extinction, sensory functioning, and time judgments. High levels of ACTH are associated with resistance to extinction of appetitive and avoidance responses; low ACTH levels retard acquisition of CERs. ACTH also inhibits habituation and facilitates timing performance. Low adrenal hormone levels are associated with increases in ability to detect signals, although integration of signals is impaired. Low hormone levels depress detection ability. Administration of glucocorticoids facilitates time judgment. While the mechanism regulating hormonal influences on behavior are unknown, it is possible that organs of the brain respond selectively to pituitary-adrenal hormones.—P. Tolin.

4368. McClintock, Martha K. (Harvard U.) **Menstrual synchrony and suppression.** *Nature*, 1971(Jan), Vol. 229(5282), 244-245. Investigated the influence of social groupings on the menstrual cycle. 135 female residents of a college dormitory were studied to determine similarity in the date of menstrual onset among roommates and closest friends. Data show a significant increase in synchronization of onset dates, and suggest that the "significant factor in synchrony . . . is that the individuals of the group spend time together. Whether the mechanism underlying this phenomenon is pheromonal, mediated by awareness or some other process is a question which still remains open for speculation and investigation." Variations in menstrual cycles as a function of the time spent with males is also discussed.—S. Appelle.

4369. Randall, Walter. (U Iowa) **The behavior of clouds correlates with thyroid activity in cats.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 270-271. Reports finding 3-5 mo rhythms in a lesion-induced abnormal grooming behavior and thyroid activity of cats. An analysis of the climatological data for the same period revealed similar rhythms in sunshine. The sunshine peaks preceded the thyroid activity peaks and a cross-correlation was significant with a temporal lag of 1 mo.—*Journal abstract.*

4370. Robertson, Richard T. & Whalen, Richard E. (California, Irvine) **Recent mating experience and olfactory preferences in androgenized female rats.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 266-267. Reports that 10 neonatally androgenized female Sprague-Dawley rats displayed a greater behavioral preference for the odor of sexually receptive female rats than did 8 controls. This preference was not seen under

conditions of low sexual arousal but was evident after a brief mating session. Results are discussed in regard to the "masculinizing" effects of early androgen treatment.—*Journal abstract.*

4371. Traugott, N. N., et al. **Insulin kak psikhofarmakologicheskoe sredstvo.** [Insulin as a psychopharmacological agent.] In N. N. Traugott, et al., "Ocherki psikhofarmakologii chekoveka." (See PA, Vol. 46, Issue 3) 229-286.—The reported research covers materials on: (a) the clinical picture of insulin-induced hypoglycemia, (b) termination of insulin-induced hypoglycemia and the clinical picture of post hypoglycemic states, (c) UCR activity and autonomic functions, (d) CR activity (changes in earlier conditioned CRs during the development of hypoglycemic state of the CR closure function of the cerebral cortex), (e) sensory functions, (f) the motor function, (g) cerebral electrical activity, and (h) atypical reactions. In the process of a developing insulin-induced hypoglycemia, a redistribution of the activity of the deep structures of the brain is observed. In the 1st phase—the initial, reticular syndrome—signs of increased activity in the posterior hypothalamus and reticular formation are observed. After the activity of these structures falls off, a phase emerges marked by the dominant activity of the thalamic nonspecific systems. Dominance on the part of the anterior hypothalamus then follows. These phases develop against a background of gradually growing and deepening depression of cortical activity. (J. p. ref.)—D. London.

Drug Effects—Human

4372. Blackwell, B. & Ayd, Frank J. (Cincinnati) **Problems in the evaluation of a new antidepressant drug in prison volunteers.** *Journal of Clinical Pharmacology & New Drugs*, 1971(Jan), Vol. 11(1), 19-23. Prison volunteers were Ss in a double-blind comparison of imipramine, placebo, and dimethacrin (the new antidepressant). Problems in study design and data interpretation included the difficulty of matching on suspected variables that could reflectively increase or decrease toxicity, favorable treatment set effects, and concern about symptom reporting and cross-contamination of complaints due to proximity of drug and placebo-treated Ss. Dimethacrin had less adverse effects on toxicity than imipramine, as judged by measures of weight loss and pulse rate and by comparison of dose counts and constipation. Dimethacrin appears to have fewer sedative and more stimulant actions than imipramine.—P. J. Federman.

4373. Caldwell, D. F., Myers, S. A., Damasio, E. F., & Merriam, P. E. (Lafayette Clinic, Div. of Psychosomatic Psychiatry & Psychology, Detroit, Mich.) **Auditory and visual threshold effects of marijuana in man.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 759-759.—Measures auditory and visual thresholds before and after smoking marijuana for 20 experienced and 20 graduates. Marijuana was administered to 10 experienced graduates. Marijuana had no effect on expected a "high" reaction. No effect on expected visual acuity, whereas 10 of 20 experienced graduates differentiated between marijuana and control Ss.—*Journal abstract.*

4374. Caldwell, D. F., Myers, S. A., Damasio, E. F., & Merriam, P. E. (Lafayette Clinic, Detroit, Mich.) **Auditory and visual threshold effects of marijuana in man.** *Addendum Perceptual & Motor Skills*

1969(Dec), Vol. 29(3), 922. Reports that the marihuana used in a previous study (see PA, Vol. 46: Issue 3) by the authors was found to be considerably reduced in potency and to contain 1.2% Δ^9 THC. Implications of these findings on the results of the experiment are discussed. —P. Hertzberg.

4375. Chapman, Loring F. (U. California, Medical School, Davis) **Experimental induction of hangover.** *Quarterly Journal of Studies on Alcohol Supplement*, 1970(May), No. 5, 67-86.—Briefly discusses the literature on the symptomatology, pathophysiological mechanisms, and the possible role of congeners in the etiology of hangover. In experimental party settings 91 21-35 yr. old moderate drinkers (in groups of 4-10), drank 1-1.75 ml of alcohol per kg as bourbon, or vodka diluted with water. The amount of food and drink taken prior to, during, and after alcohol ingestion and dilution and amount of beverage consumed were controlled. Behavioral tests (subtraction series, digit span, speech defect, and Romberg sign) were completed before and 75 min. after beginning to drink. Hangover severity was assessed subjectively on a rating scale and a checklist of symptoms. Blood alcohol levels (by Breathalyzer) 75 min. after beginning to drink, ranged from .06-.08% after 1 ml/kg of alcohol; from .10-.12% after 1.25 ml/kg; from .08-.15% after 1.5 ml/kg; and from .10-.18% after 1.75 ml/kg. No significant differences between the groups receiving vodka or bourbon were observed on the behavioral tests. Only 1 of 10 who had drunk 1 ml/kg and 2 of 10 who had drunk 1.25 ml/kg reported hangover. At these levels no difference between vodka and bourbon could be discerned with regard to capacity for inducing hangover. Hangover was reported by 33 of 60 who had drunk 1.50 ml. kg and 6 of 11 who had drunk 1.75 ml. kg. Of the 30 vodka drinkers and the 30 bourbon drinkers who had drunk 1.5 ml. kg, 13 and 20, respectively, reported definite hangover and 1 and 10 reported severe hangover. Reasons for the differential effects of the 2 beverages are discussed (55 ref.)—*Journal abstract*.

4376. Itil, Turan M. (U. Missouri, Medical School, St. Louis) **Digital computer "sleep prints" and psychopharmacology.** *Biological Psychiatry*, 1969(Jan), Vol. 1(1), 91-95.—The graphic form of the digital computer-classified sleep EEG shows the total profile of the all-night sleep process. Since these profiles seem to be characteristic for each individual and remain relatively stable under standard conditions, they have been called "sleep prints." A study of the all-night sleep records of 7 normal volunteers indicated that sleep prints are, however, easily altered by endogenous or exogenous factors that affect the sleep process. In the sleep prints of chronic schizophrenics, fewer very deep sleep stages, high variability of the sleep stages, and irregular cyclic variation of the periods were found. Psychotropic drugs induced marked changes in sleep prints and these changes were more significant than the alterations of the length of REM periods in discriminating psychotropic drugs. (18 ref.)—*Journal summary*.

4377. Karlin, Edward S., Hayes, William N., Teger, Allen I., & Pruitt, Dean G. (State U. New York, Buffalo) **Effects of alcoholic beverages differing in congener content on psychomotor tasks and risk taking.** *Quarterly Journal of Studies on Alcohol Supplement*, 1970(May), No. 5, 101-114. In a double-blind study, 18 21-30 yr. old male students drank tap water or 4 doses of .4 ml/kg of alcohol at hourly intervals, as bourbon or vodka. Psychomotor tests were given before and 1 and about 5 hr. after drinking began. Differences between

blood alcohol levels after both beverages (each containing 43% alcohol) were negligible at 1 and at 5 hr. Simple and complex RT tasks showed differences at 1 hr. after drinking between the water and the beverages conditions but not between the 2 beverages. On a mirror-drawing task the improvement which occurred between the predrinking and alcohol session at 1 hr. was greatest after water and least after bourbon ($p < .05$). Mean difference scores between initial and the 5-hr sessions in the RT and the mirror-drawing tasks showed the same trend: improvement was greatest after water and least after bourbon. The immediate effects of alcoholic beverages upon RT seem to be determined by alcohol, while the congener effects are minimal; after the alcohol is metabolized the congeners seem to have a deleterious effect which is maximized when decision-making is involved rather than simple "reflexive" responding. In Exp. II, 18 male students were given 4 doses of alcohol at hourly intervals, each containing .2 ml/kg of alcohol. They were assigned randomly to 1 of 3 beverages: synthetic bourbon, synthetic vodka, both containing 4 times the level of congeners in commercial beverages, or congener-free synthetic alcohol. Kogan and Wallach's 12-item choice-dilemma questionnaire was administered after drinking (mean blood alcohol level of .08%) and to another sober group of 18. The alcohol-affected Ss, on the average, took greater risks than did the sober ones. The only significant difference in performance was that between the sober and the bourbon-drinking groups. Those given bourbon took significantly more risks than those given vodka and tended to take more risk than those given synthetic alcohol. The pattern of differences in risk taking between the alcohol-affected and sober groups was similar to that found in previous research on young and old groups. Mechanisms which may account for greater risk taking after drinking seem similar to those in young people.

4378. League, Richard & Kulig, Sharon G. (U. Florida, J. Hillis Miller Teaching Hosp.) **Smoking and biolinguistic function.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 763-764.—Toxic agents in the blood of the heavy smoker lead to a condition of anoxia that predisposes the smoker to heart attack. The possible inhibitory effect of such anoxia upon the biolinguistic innerlanguage mechanisms of the brain was explored. Semantic spaces of heavy smokers were tested and compared with those of a matched sample of non-smokers. 5 classes of concepts were employed: (a) random, (b) environmental, (c) machisma, (d) body image, and (e) smoker oriented. Polarity responses resembling a chronic form of semantic satiation uniform throughout all concept groups were discovered in the semantic spaces of heavy smokers ($p < .025$).—*Author abstract*.

4379. Lobb, Harold & Kaplan, Jack. (U. Western Ontario, London, Canada) **Protection of GSR conditioning by dextroamphetamine.** *Canadian Journal of Psychology*, 1970(Feb), Vol. 24(1), 15-26.—Administered d-amphetamine (.175 mg/kg) or placebo capsules to 64 normal human adults on 2 successive days in a factorially designed study of GSR acquisition and extinction. Ss performed a phi-phenomenon task during sessions with tone and electric shock as the conditioning stimuli. The drug prevented habituation of conditioned GSRs during acquisition trials, and when given next day it prevented extinction. However, the capacity of this

dosage to offset GSR habituation to the tone in a control group was relatively weak, and no influence was discernible on GSRs to shock, levels of skin resistance, or phi-phenomenon response. (French summary) (15 ref.)—*Journal abstract.*

4380. **Murphree, Henry B., Schultz, Robert E., & Jusko, Allan G.** (Rutgers State U., Medical School) **Effects of high congener intake by human subjects on the EEG.** *Quarterly Journal of Studies on Alcohol Supplement*, 1970(May), No. 5, 50-61.—Briefly reviews previously reported studies of the effects of alcoholic beverages on the EEG. Some preliminary and tentative findings resulting from a new technique of time-serial frequency analysis of the EEG are also reported. Base-line EEG recordings from 3 scalp areas of both hemispheres were made in 10 21-40 yr. old healthy, light to moderate drinkers, after which they drank randomly either bourbon or vodka in amounts providing .8 g/kg body weight of alcohol, superbourbon providing .1 or .2 g/kg alcohol, and 4 or 8 times as much congeners in the same proportions as in bourbon, or orange juice placebo. Recordings were repeated at hourly intervals for 6 hr. In some Ss who had large amplitude alpha before alcohol ingestion bourbon produced a fast (beta) activity in the frontal areas (between 16-28 cycles with peaks at 23/sec). This activity was not seen in the parietal or the occipital areas. No reciprocity occurred between alpha-band frequencies and "fast" activity in the frontal areas. A qualitatively unique but not uniform effect was noted after the superbourbon. After the lower dose of superbourbon (yielding a blood alcohol level of about 15 mg/100 ml) the spectra were initially almost indistinguishable from base-line recordings: occipitals showed moderate alpha, parietals reflected this in muted form, and the frontals presented no characteristic peak frequency activity. During succeeding recordings the alpha amplitude diminished and prominent activity appeared in the parietals, peaking at 8.5/sec. The increased variability of alpha associated with drowsiness trends is similar to that found with other beverages but the 8.5/sec activity in the parietals is a new finding, similar to the effect of barbiturates.—*Journal abstract.*

4381. **O'Hanlon, James F.** (Human Factors Research, Inc., Santa Barbara, Calif.) **Adrenaline's effects on human vigilance: Continuous versus pulsatile infusions.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 765-766.—In an earlier study a relationship was shown between the level of circulating adrenaline and the human ability for maintaining vigilance. This study was designed to determine whether that relationship is causal. In Exp. I, 4 men performed a visual monitoring task while receiving a graded series of continuous adrenaline infusions; in Exp. II, 6 men performed the same task while receiving a series of pulsatile adrenaline infusions. Corresponding infusions in the 2 series delivered equivalent doses of adrenaline and produced similar adrenaline excretion rates. Continuous adrenaline infusion had little effect on signal detection performance but pulsatile adrenaline infusion improved it significantly.—*Author abstract.*

4382. **Traugott, N. N., et al.** **Aminazin, ili khlorpromazin.** [Aminazine or chlorpromazine.] In N. N. Traugott, et al., "Ocherki psikhofarmakologii cheloveka." (See PA, Vol. 46:Issue 3) 9-74.—The reported research covers materials on: (a) the clinical picture of typical reaction to aminazine administration (states of emotional indifference, motor rigidity, drow-

ness, and aminazine sleep), (b) UCR activity and autonomic functions, (c) CR activity (influence of aminazine on earlier elaborated CRs, state of the cortical closure function), (d) sensory functions (absolute auditory sensitivity, absolute threshold as a function of stimulus duration, differential thresholds for frequency and intensity, adaptational capacity of the auditory apparatus, comprehensibility of speech, discrimination of tonal and speech signals from noise), (e) the motor function, (f) cerebral electrical activity (spontaneous activity, evoked potentials, rhythmic assimilation of light flashes, i.e., driving response), and (g) clinical and experimental characteristics of atypical reactions to aminazine administration (states of affective excitation, deep sleep, trace exaltation; factors promoting the development of atypical reactions). The data demonstrate that the tranquilizing action of aminazine is due to the complex redistribution of activity in the deep structures of the brain. (6 p. ref.)—*I. D. London.*

4383. **Traugott, N. N., et al.** **Amital-natril, ili barbamil.** [Sodium amytal or barbamyl.] In N. N. Traugott, et al., "Ocherki psikhofarmakologii cheloveka." (See PA, Vol. 46:Issue 3) 75-151.—The reported research covers materials on: (a) the clinical picture of sodium amytal (SA) action (euphorizing, weak soporific effect and quieting effects; acute motor and speech disinhibition, emotional release, state of affective easing, prolonged and relatively deep sleep), (b) UCR activity and autonomic functions, (c) CR activity (influence of SA on earlier elaborated CRs, state of the cortical closure function, absolute sensitivity, absolute threshold as a function of stimulus duration, differential thresholds for frequency and intensity, adaptational capacity of the auditory apparatus, speech comprehension, discrimination of tonal and speech signals from noise), (d) the motor function (action of SA in the absence of lesion of the motor systems, action of SA in stuporous states), and (e) electrical activity of the brain (changes in spontaneous electrical activity, reactions to afferent stimuli, effects of direct stimulation of the deep structures, spontaneous activity, desynchronization in response to afferent stimuli, evoked potentials, rhythmic assimilation of light flashes, i.e., driving response). The data show that the activity of the nonspecific nuclei of the thalamus and the caudate nuclei is sharply increased under the influence of SA. At the same time, the activity of the associative nuclei of the thalamus, brainstem reticular formation, and posterior hypothalamus is depressed. The structures of the anterior hypothalamus are not depressed by SA. (3 p. ref.)—*I. D. London.*

4384. **Traugott, N. N., et al.** **Amizil, ili benaktizin.** [Amyzil or benactyzine.] In N. N. Traugott, et al., "Ocherki psikhofarmakologii cheloveka." (See PA, Vol. 46:Issue 3) 183-199. The reported research covers materials on: (a) the clinical picture of amyzil action, (b) UCR activity and autonomic functions, (c) CR activity, (d) sensory functions, (e) the motor function, and (f) cerebral electrical activity. Only the 2nd phase of amyzil action may be viewed as a manifestation of its cholinolytic effect, both central and, to a lesser degree, peripheral. The last phase in all its manifestations corresponds to a picture of very great excitation of the sympathoadrenal system: feelings of anxiety and internal disturbance, acute tachycardia, elevation of arterial pressure, etc. (48 ref.)—*I. D. London.*

4385. **Traugott, N. N., et al.** **Bemegrid, ili megimid.** [Bemegride or megimide.] In N. N. Traugott, et al., "Ocherki psikhofarmakologii cheloveka." (See PA, Vol.

46: Issue 3) 200-228.—The reported research covers materials on: (a) the clinical picture of the antidepressant effect of a single injection of bemegride, (b) UCR activity and autonomic functions, (c) CR activity, (d) sensory functions, and (e) cerebral electrical activity (spontaneous activity, desynchronization, rhythmic assimilation, i.e., driving response, and evoked potentials). Bemegride is shown to have a marked antidepressant action. It improves mood, heightens sociability and motor activity, and eliminates asthenia and apathy. To a lesser degree the drug has an effect on anxiety and depressive forms of delusion. It sometimes intensifies anxiety. It is most effective in typical depression and in astheno-depressive syndromes, observed in the depressive phase of manic-depressive psychosis and in somatogenic psychosis. Bemegride is less effective in depressive-paranoid and anxiety-depressive syndromes and has no influence on depressive states arising in schizophrenia. The effect of single injections of bemegride is prolonged and is reproduced with repeated injections. (2 p. ref.)—*I. D. London.*

4386. Traugott, N. N., et al. **Ocherki psikhofarmakologii cheloveka.** [Essays on the psychopharmacology of man.] Leningrad, USSR: Nauka, 1968. 326 p.—Presents the results of many years of clinical and experimental research on the mechanisms underlying the action of various psychopharmacological drugs on the human brain. The general characteristics of the drugs are described along with contemporary conceptions concerning the mechanisms of their action.—*I. D. London.*

4387. Traugott, N. N., et al. **Tofranil, ili melipramin.** [Tofranil or melipramine.] In N. N. Traugott, et al., "Ocherki psikhofarmakologii cheloveka." (See PA, Vol 46 Issue 3) 152-182.—The reported research covers materials on: (a) the clinical picture of tofranil action, (b) changes in nervous activity and cerebral electrical activity (for the phases of adynamia and sleepiness, affective changes, and increased irritability and anxiety, UCR activity and autonomic functions, CR activity, sensory functions, the motor function, cerebral electrical activity), (c) some physiological mechanisms determining the clinical picture of the 2nd phase of tofranil action, and (d) the effect of single administration of tofranil as a function of the psychopathological syndrome. Data show that single administration of therapeutic doses of tofranil produces a nonuniform phasic effect. First sleepiness arises, followed by a period of improvement of mood or by a state of increased irritability and anxiety. The physiological mechanisms for each of these effects are different. (3 p. ref.)—*I. D. London.*

4388. Wilson, Arthur S., Barboriak, Joseph J., & Kass, Warren A. (Veterans Administration Center, Wood, Wis.) **Effects of alcoholic beverages and congeners on psychomotor skills in old and young subjects.** *Quarterly Journal of Studies on Alcohol Supplement*, 1970(May), No. 5, 115-129.—2 groups of 30 volunteers each (60-85 yr. old and 21-35 yr. of age) were given 3 psychomotor tests before and .5 hr. after drinking vodka, bourbon (both containing .75 g/kg of alcohol) or water. Beverages were presented randomly and each S served as his own control. In all 3 of the following tests young Ss performed better than did old Ss after water, while alcohol impaired the performance of the young more than that of the old. On the Digit Symbol test vodka in comparison with water significantly decreased speed and accuracy in both groups. In the young bourbon reduced the numbers of symbols attempted and correct but

impaired only accuracy in the old. On the Hand Steadiness test the performance of the 2 groups was similar after alcohol. The old group performed better after bourbon or vodka than after water while the young performed better after water than after bourbon or vodka. On the Body Sway test the young swayed less than the old after alcohol. The old swayed less after bourbon or vodka than after water, while the young swayed less after water than after bourbon or vodka. The hypothesis that bourbon, but in congeners, would have a more detrimental effect than would vodka was not clearly demonstrated. Vodka impaired performance of the old group in number of symbols attempted and in body sways while bourbon did not. Bourbon, however, reduced hand steadiness in the old group, while vodka did not. The differential effects of alcohol and congeners on the CNS are discussed.—*Journal abstract.*

Drug Effects—Animal

4389. Alpers, Hilma S. & Himwich, Harold E. (Galesburg State Research Hosp., Hudichum Psychiatric Research Lab., Ill.) **An in vitro study of the effects of tricyclic antidepressant drugs on the accumulation of C¹⁴-serotonin by rabbit brain.** *Biological Psychiatry*, 1969(Jan), Vol. 1(1), 81-85.—Investigated the effects of psychotherapeutic agents imipramine, desipramine, and amitriptyline on the accumulation of serotonin by brain tissue. The method involved the determination of accumulation of radioactivity for each of the drugs in rabbit brainstem slices incubated 30 min. at 37°C in 5 ml. Krebs bicarbonate medium containing .25 nmole C¹⁴-serotonin. Results show that (a) brainstem slices concentrated radioactive serotonin 3-4 times above the initial concentration of amine in the medium in which the slices were incubated, (b) all 3 of the drugs interfered with this accumulation of radioactivity in a dose dependent fashion, and (c) imipramine was more effective than desipramine in antagonizing the accumulation of serotonin.—*P. McMillan.*

4390. Altman, Jack L. & Appel, James B. (U. Chicago) **Effects of LSD on fixed-interval responding in the rat.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 757-758. Rats were trained on a fixed-interval (FI) 5-min schedule of reinforcement, and then injected with various doses of LSD. High doses of LSD (.04-.32 mg/kg) tended to decrease the overall response rate and to disrupt the FI temporal discrimination. The effects appeared to vary directly with the dose, the greatest suppression and disruption of the discrimination occurring with the highest doses. *Author abstract.*

4391. Aprison, M. H. & Hingtgen, J. N. (Indiana U., Medical Center, Indianapolis) **Brain acetylcholine and excitation in avoidance behavior.** *Biological Psychiatry*, 1969(Jan), Vol. 1(1), 87-89. Reports studies of the effect on the duration of behavioral excitation in animals following administration of iproniazid plus tetrabenazine. Adult male albino Wistar albino rats were stabilized on a Sidman shock-avoidance schedule. Ss were subcutaneously administered 50 mg/kg iproniazid phosphate 16-18 hr. before the session and 2 mg/kg tetrabenazine 30-60 min. after the start of the session. If no behavioral excitation occurred following tetrabenazine injection, these Ss were killed at times comparable to excited Ss on a predetermined basis. The brains were removed and dissected and acetylcholine (ACh) concentrations determined for 3

4399. Findley, Jack D. & Robinson, William W. (Johns Hopkins U., Medical School) **Preference for self-infusion of seconal over librium in primates.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 753-754. 2 rhesus monkeys were exposed to a forced-choice procedure which provided opportunity for self-infusion of 2 drugs. After addiction to librium, Ss were given a choice between librium and seconal. The initial preference for librium was gradually supplanted by a preference for seconal. The data generally support the notion of a greater addiction liability for seconal and suggest the possibility of other drug preference studies. *Author abstract.*

4400. Göpfert, E. & Hashke, W. (Inst. of Physiology, Leipzig, E. Germany) **Osobennosti reaktsii tsentral'noi nervnoi sistemy pod uretanovym, pentobarbitalovym i khloraloznym narkozom u krolikov.** [Features of the reaction of the nervous system under urethane, pentobarbital and chloralose anesthesia in rabbits.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:609) 244-250. —Rabbits were used to study the effects of 1 g/kg urethane, 50 mg/kg pentobarbital (SPB), and 80 mg/kg chloralose in the light of Anokhin's view of anesthetics as "selective filters" of afferent impulses arriving in the CNS. Reticular formation and hippocampal stimulation thresholds, the electrocorticogram, respiratory changes, and phytically evoked potentials were recorded. Urethane, without definite effects on the reticular formation, depressed the excitability of hippocampal neurons. SPB depressed mainly reticular formation excitability. The influence of chloralose was not clear. While hippocampal stimulation thresholds were different for chloralose, the effect on the reticular formation was the same as for SPB. It is suggested that fine analysis of sensory evoked potentials should be helpful in future research. (English summary) (15 ref.)—*I. D. London.*

4401. Hendley, Edith D. & Snyder, Solomon H. (Johns Hopkins U., Medical School) **Correlation between psychotropic potency of psychotomimetic methoxyamphetamines and their inhibition of ³H-normetanephrine uptake in rat cerebral cortex.** *Nature*, 1971(Jan), Vol. 229(5282), 264-266. Describes "a close correlation between the psychotic potency of a series of methoxyamphetamines and their ability to inhibit the accumulation of normetanephrine by brain slices" in male Sprague-Dawley rats. This correlation suggests "that the sites of normetanephrine uptake may be related in some way to the locus of action of these drugs." It is suggested that the postsynaptic receptors for norepinephrine in the brain might be a good candidate for such a site. (26 ref.)—*S. Appelle*

4402. Jeter, Ronald D. & Hurst, Charles M. (Holloman Air Force Base, 6571st Aeromedical Research Lab., Alamogordo, N.M.) **Effects of staphylococcal enterotoxin B on complex operant behavior in monkeys.** *USAF ARL Technical Report*, 1970(Sep), No. 70-14, 25 p.—Tested 4 female rhesus macaques (*Macaca mulatta*) following gastric infusion of 20 µg/kg of staphylococcal enterotoxin B. Ss demonstrated significant performance decrements on shock avoidance schedules judged high activity, high concentration, and on positive reinforcement schedules judged medium activity, high concentration, and low activity, medium concentration. Results obtained under a con-

trolled atmosphere of 10,000-ft simulated altitude and 100% oxygen, indicate individual toxicological effects on behavior with avoidance schedules showing a stress level difference USAF ARL

4403. Johanson, Chris F. (U. Chicago) **The choice of cocaine by rhesus monkeys as a function of dosage.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 751-752. If animals are allowed to self-administer psychomotor stimulants, the higher the dosage, the lower the rate of self-administration. In the present study, rhesus monkeys were given a choice between a high and low dose of cocaine (5 and 1 mg/kg). The higher dose normally generated lower rates of self-administration. However, in the choice situation with trials separated by time, the higher dose was markedly preferred. Such results may indicate that rate is an inadequate measure of reinforcing efficacy because drugs have other properties as well. A similar situation has been found with reinforcing ICS. *Author abstract.*

4404. Kilbey, M. Marlyne; Harris, Robert T., & Aigner, Thomas G. (Texas Research Inst. of Mental Sciences, Houston) **Establishment of equivalent external- and internal-stimulus control of an operant behavior and its reversal.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 767-768. 24 rats were Ss in an operant discrimination task. A factorial design tested: (a) type of discriminative stimulus, amphetamine vs. saline or tactile stimulus vs. its absence, (b) an experience factor, 30 days prior exposure to the discriminative stimulus or no prior experience, and (c) duration of training, in 4 experimental and 2 control groups. Experimental Ss were trained to perform a 2-lever multiple DRI 15"-DRI 15" in which the correct lever was indicated by a specific discriminative stimulus. In Exp. I, the percentage of correct lever responses of the experimental Ss in extinction tests was significantly higher than that of the control groups, and showed significant improvement over tests. Experience was a significant factor with the performance of the preexposed amphetamine groups being superior to that of the other experimental groups. In Exp. II, a lever reversal discrimination was instituted with all other conditions remaining constant. The percentage of correct lever responses during extinction was significantly higher for the experimental groups and performance improved over tests. There was no difference in performance for the 2 types of stimuli employed. These data are discussed in terms of equivalence of external and internal stimulus cues and the question of whether internal cued behaviors are more resistant to change than those established using external cues.—*Author abstract.*

4405. Kodluboy, Donald W. & Thompson, Travis. **Adjunctive self-administration of barbiturate solutions.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 749-750. Using the schedule-induced polydipsia technique, the parameter values of the inducing schedule appear to be the main condition determining such adjunctive oral drug self-administration. Rats working for food on a multiple fixed ratio-fixed ratio food reinforcement schedule, concurrently self-administered thiopental sodium, as a function of the fixed ratio schedule values and concentration of the drug solution. The total mg. consumption of thiopental was a negatively accelerating function of the drug solution

406.—In vitro, pyrazol and 4-bromopyrazol are strong inhibitors of alcohol dehydrogenase (ADH) of rat liver. The present study shows that, in vivo, pyrazol and 4-bromopyrazol decreased ethanol oxidation in the rat. The action of various inhibiting doses, and also the influence of the delay between their administration and the ethanol injection were studied. The comparison of the active doses in vivo of pyrazol and 4-bromopyrazol with their inhibition constants of ADH in vitro showed that their action on ethanol oxidation was due to ADH inhibition. The ADH inhibition in vivo caused by pyrazol was also revealed by sleeping time prolongation obtained with 2-phenylethanol. (German, Spanish, & Russian summaries)—*English summary*.

4414. Sterman, M. B., Fairchild, M. D., & Van Twyver, H. B. (U. California, Los Angeles) **Subconvulsive effects of monomethylhydrazine on runway performance in the cat.** *USAF AMRL Technical Report*, 1969(Jun), No. 68-183, 7 p.—Previous neurophysiological and behavioral studies of the toxic propellant 1, 1-dimethylhydrazine have indicated that its subtle low-dose influences can be most effectively evaluated in the cat by reference to trained locomotor performance. To determine similar fundamental information in evaluating monomethylhydrazine (MMH), a related derivative of hydrazine, this same technique was employed. Ss were trained and tested in a special runway apparatus to provide a reliable indication of performance changes over a 6-hr period following the administration of 1, 2, and 4 mg/kg MMH. These low doses significantly altered locomotor performance, both during drug session testing and saline control testing carried out 24 hr. later. Within 30 min. after injection of all 3 doses of MMH, runway performance was depressed. At 2 and 4 mg/kg, this influence was profound and was associated with overt physiological symptoms of toxicity. A total disruption of performance occurred with 4 mg/kg doses when tested 2-5 hr. after administration. Performance was still depressed after 24 hr. following 4 mg/kg, but was actually facilitated at this same point following 1 and 2 mg/kg doses.—*USAF AMRL*.

4415. Stern, Warren C. & Hartmann, Ernest L. (Boston State Hosp., Mass.) **Catecholamines and desynchronized sleep.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 743-744.—Presents behavioral evidence that following desynchronized sleep deprivation in rats the activity of catecholamine systems in the brain are depressed. D-amphetamine produced significantly less stimulation in both general activity levels and continuous avoidance responding following 4-7 days of desynchronized sleep deprivation. Acquisition deficits on active and passive avoidance tasks, which occurred following 4-5 days of desynchronized sleep deprivation, were reversed by drugs which enhance central catecholamine activity—imipramine, pargyline, and L-dopa. These agents did not improve avoidance acquisition in stress control or normal Ss. Results support the view that desynchronized sleep "maintains" central catecholamine systems.—*Author abstract*.

4416. Thor, Donald H. (E. R. Johnstone Training & Research Center, Bordentown, N.J.) **Amphetamine induced fighting during morphine withdrawal.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 245-250.—Male hooded rats received ad lib d-amphetamine sulfate in concentrations of 50 or 200 mcg/ml in their drinking water for 10 days after withdrawal from

morphine (100 mg/kg/day). Lethal and near-lethal fighting occurred among Ss consuming the greater amphetamine concentration. Less intense, ritualistic fighting occurred among Ss consuming the lesser amphetamine concentration. A control group under withdrawal from the same morphine regimen also exhibited nontraumatic fighting. Amphetamine appears to be an effective pharmacological stimulus to violent fighting during a broad segment of the withdrawal syndrome.—*Journal summary*.

4417. Thuret, F., Lamothe, C., & Laborit, H. (Boucaut Hosp., Paris, France) **Action in vivo et in vitro du dichlorhydrate de la morpholino-N-éthylamino-3 méthyl-4 phényl-6 pyridazine (Agr 620) sur la monoamine oxydase des mitochondries du foie et du cerveau de rat.** [In vivo and vitro effect of N-morpholino-3-ethylamino-4-methyl-6-phenylpyridazine (Agr 620) on rat liver and brain mitochondria monoamine oxidase.] *Agressologie*, 1970, Vol. 11(5), 417-420.—Agr 620 in vitro, or injected into the S, did not possess any inhibiting effect on the MAO of isolated brain and liver mitochondrias marked enough to account for its pharmacological activity. (German, Spanish, & Russian summaries)—*English summary*.

4418. Tilson, Hugh A. & Sparber, Sheldon B. (U. Minnesota) **Releasable norepinephrine-³H, injected centrally, as a function of dose of d-amphetamine injected peripherally.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 739-740.—Trace doses of irritated norepinephrine were injected into the lateral ventricles of rats 1 hr. prior to perfusion using push-pull cannulas. While responding on a fixed-ratio schedule of reinforcement for food, they were injected, ip, with varying doses of d-amphetamine sulfate (1, 2.5, and 5 mg/kg), mescaline hydrochloride (10, 15, and 20 mg/kg), or .5 ml NaCl. Both drugs disrupted operant behavior, but only d-amphetamine produced a dose-related increase in radioactivity in the recovered ventricular perfusate. These data support the contention that d-amphetamine alters the disposition of catecholamines in structures bordering the cerebroventricular system.—*Author abstract*.

4419. Vavilova, N. M., Klyavina, M. P., & Toropova, N. V. (Pavlov Inst. of Physiology, Leningrad, USSR) **Vliyaniye aminazina na passivno-oboronitel'noe povedenie u sobak.** [Influence of aminazine on passive-defensive behavior in dogs.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 196-200.—Attempted to determine the effect of 5-5 mg/kg aminazine (chlorpromazine), administered im 40 min. before experimentation, on the passive-defensive behavior (absence of investigatory reaction, suppression of motor activity, refusal to eat in a new setting) of 5 adult dogs (the passive-defensive reflex was inherited in 2 Ss, and was experimentally initiated by electrotraumatization when young in 3 Ss). Aminazine weakened the passive-defensive reflex and promoted the appearance of the alimentary reaction. This was distinctly the case in the electrotraumatized Ss. When aminazine was administered in both the morning and the evening, motor activity was inhibited, especially in the evening. Aminazine, as an inhibitor of the nervous apparatus involved in tension and reactions to pain, "as a liberated the 'biologically positive reactions'—as a result of which the investigatory reflex returned, frequent nocturnal awakening disappeared, and the alimentary

results of studies relating heart rate in the rat to learning, motivation, arousal, etc. may be secondary effects of changed behavior patterns such as an increase or decrease in grooming. (French summary) (20 ref.)—*Journal abstract.*

4427. Vogt, J. J., et al. (Centre National Recherches Scientifiques, Centre d'Etudes Bioclimatiques, Strasbourg, France) **Estimation des charges de travail et des charges de chaleur en situation réelle de travail: Principes et applications d'une nouvelle méthodologie.** [Estimates of work and heat loads in a real working situation: Principles and applications of a new method.] *Travail Humain*, 1970(Jan), Vol. 33(1-2), 125-139.—A continuous telemetric heart rate recording was carried on in a regulated room, allowing a quantitative measure of heat stress and metabolism. Discussed are such applications as place of work, redesign of working environment, physical fitness testing, and allocation of manpower.—R. W. Husband.

ENVIRONMENT & STRESS

4428. Bell, R. W., Miller, C. E., Ord, J. M., & Roisten, Carolyn. (Northern Illinois U.) **Effects of population density and living space upon neuroanatomy, neurochemistry, and behavior in the C57Bl/10 mouse.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 258-263.—Assigned 156 male C57Bl/10 mice to live in groups of 1, 4, 8, 16, or 32 Ss. For all group sizes Ss were housed either in cages of a constant size, so that group size and crowding correlated, or were housed in cages with floor space varied proportional to the group size. Closed-maze exploration decreased with increased group size, irrespective of crowding, while wheel activity was an interactive effect of group size and degree of crowding. Reduced concentrations of brain protein and nucleic acids accompanied living in larger groups, whether crowded or not, but rate of intracellular synthesis of RNA and protein by DNA was more dependent upon the size of the living space. (15 ref.)—*Journal abstract.*

4429. Fröberg, Jan, et al. (Karolinska Hosp., Lab. for Clinical Stress Research, Stockholm, Sweden) **Conditions of work: Psychological and endocrine stress reactions.** *Archives of Environmental Health*, 1970(Dec), Vol. 21, 789-797.—Briefly discusses psychosocial stressors in modern working life and measurement of their psychophysiological effects, and presents 3 stress studies. In Study I, officers and soldiers were exposed to a stressful 75-hr vigil. Significant stress reactions occurred with respect to erythrocyte sedimentation rate, protein-bound iodine, serum iron level, EKG pattern, behavior, and catecholamine excretion. Pronounced circadian rhythms and significant psychophysiological correlations were demonstrated. In Study II, the remuneration of salaried invoicing clerks was abruptly changed to piece-wages. Ss exhibited a sharp rise in performance but also an increase in discomfort ratings and catecholamine excretion. In Study III, office clerks were moved to and from various types of offices. In general, moving from a conventional office to an office landscape was accompanied by an increase in fatigue ratings and catecholamine excretion. The implications of these findings for environmental health are briefly discussed.—*Journal abstract.*

4430. Golubeva, E. L. (All-Union Research Inst. of Obstetrics & Gynecology, Moscow, USSR) **Tsentral'nye mekhanizmy funktsional'noi sistemy rozhdeniya.**

[Central mechanisms of the natal functional system.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 133-142.—Attempted to determine the structures of the CNS which are the first to react to modifications of the gaseous composition of the blood and which form corresponding behavior in postnatal ontogenesis. Awake kittens with electrodes implanted in the cortex and subcortical structures were Ss in experiments employing asphyxia. During the 1st postnatal days asphyxia produced an activation reaction in the form of a stress-rhythm (4/sec) in the reticular nuclei of the pons and mesencephalon, in the sensory cortex, and in the structures of the limbic system. At 15-30 days of age the hypothalamic nuclei and the thalamic parafascicular complex were also involved in the reaction. A protracted afteraction was shown to exist as well as a rapid elaboration of CRs to the entire experimental situation. In the birth process a functional system exists, assuring not only the emergence of the 1st inspiration of the child and the beginning of rhythmic respiration, but also a definite complex of motor activity and cardiovascular reactions. It is this system which may be characterized as a natal functional system. (English summary) (36 ref.)—I. D. London.

4431. Gumma, Mitchel R. & South, Frank E. (U. Missouri) **Hypothermia and behavioural thermoregulation by the hamster (*Mesocricetus auratus*).** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 504-511.—Investigated changes of environmental temperature preferences in adult male hamsters after 1 hr. hypothermia at 10 or 0° C. Immediately after cold treatment Ss exhibited a preference for 6, 12, and 18° C environment before returning to the normally preferred 26° C. Duration of this downshift was significantly longer following 10° C than that following 0° C. It is suggested that the lability in thermoregulation is the result of some physiological readjustment.—*Journal summary.*

4432. Krauklis, I. A. **Vegetativnye komponenty reaktivnoi trevogi pri situatsionnykh nevrozakh.** [Autonomic components of the anxiety reaction in situational neuroses.] In Kh. A. Maurinyan (Ed.), "Voprosy biologii." (See PA, Vol. 45:7735) 173-179.—12 dogs were used to study the autonomic components of the anxiety reactions under conditions of a developing "difficult state" of the nervous system and consequent situational neurosis. Mechanographic polygraphic photokymograms recorded several autonomic and somatic indices during formation of CR anxiety and tension reactions. Among the former indices were the sphygmogram, tachoscillogram of the general carotid artery, and the gastric contraction curve. A deep and prolonged "difficult state," turning into a situational neurosis, was in most cases accompanied by a passive form of the anxiety reaction or by the so-called passive-defensive reaction which is a characteristic form of behavior for dogs with a weak type of nervous system. The effector functional structure of the passive form of the anxiety and tension reactions were characterized by the absence of active behavioral reactions and the presence of violent autonomic reactions (great increase in respiratory rate, the emergence in the pneumogram of 2nd and 3rd order waves and of periodic stomach contractions in synchrony with these waves, and massive salivary excretion and flow from the oral cavity).—I. D. London.

4433. Malz, S. (Central Emek Hosp., Afula, Israel) **Psychological aspects of premature separation of the placenta.** *Harefuah*, 1970(Oct), Vol. 79(8), 339-

341.—In order to evaluate the possible effect of psychological trauma as a cause of accidental hemorrhage, the period of the "Six Day War," during which many women were emotionally and personally involved, was studied. The survey included 2408 births from 16 hospitals during June 1967, compared with 2920 births from the same hospitals, and the same month, in 1966. The incidence of prematurity, perinatal mortality, and toxemia was compared. The rate of accidental hemorrhage in June 1967, compared with the same month in 1966, was 1.7:1. However, this result cannot be statistically significant, because of the small number of cases compared with the relatively large number of births. The histories of 5 cases are presented. It is suggested that in cases of psychic stress the utero-placental junction and its arteriolar compartment are affected. This is a highly vulnerable area in pregnancy, which may react to psychic trauma by spasm of prolonged duration, resulting in vasorhexis and bleeding, leading to placental separation. This theory of triggering by psychic trauma has yet to be proven.—*English abstract.*

4434. Milyagin, Ya. A., Lebedeva, A. G., Kazakova, N. M., & Korchagina, A. A. (Medical Inst., Smolensk, USSR) Znachenie ekologicheskikh faktorov v razviti vrozhdennykh form integrativnoi deyatel'nosti mozga. [Significance of ecological factors in the development of inborn forms of integrative activity of the brain.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 154-160. Discusses experimental data on heterochronicity in the morphophysiological development of some functions of the organism due to ecological factors. In the rabbit the functional systems, ensuring respiration and sucking, are the most developed at parturition. The system for locomotion and that for ear movement seem to be delayed. In chicks the maturation of motoneurons in the shoulder segment of the spinal cord is almost complete at hatching, but that in the lumbar segment is incomplete. Heterochronicity in the morphophysiological development of the organism is a general biological principle of development which arises in phylogenesis and assures the unity of the organism and environment at each stage of its individual development. (English summary) (18 ref.)—*J. D. London.*

GENETICS

4435. Guttman, Ruth. (Hebrew U., Jerusalem, Israel) Parent-offspring correlations in the judgment of visual number. *Human Heredity*, 1970, Vol. 20(1), 57-65.—The estimation of 6 or fewer objects ("subitizing") is considered to be a form of judgment which differs in speed and accuracy from the "estimation" of 7 objects or more. 120 complete families (father, mother, and 1 or more children) and a further 100 families lacking either father or mother estimated 100 families of marbles or balls shown to them in the numbers of marbles or balls shown to them in transparent bags. Results indicate that there exist at least 2 phenotypes of judgment of numerosity: (a) subitizing of 6 marbles and 5 ping-pong balls, with high heritabilities, and (b) estimation of 34 small 15 small and 15 large marbles, with 0 to low heritabilities, in the same population tested at the same time. The heritability estimates are based on parent-offspring correlations corrected for assortative mating. Assortative mating was found for the 5 and 6 objects only. Father:son, mother:son, father:daughter, mother:daughter correlations were almost identical and gave no indication of

differential maternal or paternal influences on estimation. Analyses of phenotypic distributions, mapping from different types of matings, based on under- and correct estimation, indicate that estimating 2 sets of less than 7 objects (subitizing) may be inherited on a polygenic basis while estimating sets of 15 or 34 objects shows low to no genotypic control.—*Journal abstract.*

4436. McLearn, Gerald E. L. (Columbia Univ., Behavioral Genetics) Behavioral genetics. *Behavioral Science*, 1971 (Jan), Vol. 16(1), 64-81.—Review developments in the field of behavioral genetics since 1950. Research on human beings has largely involved application of quantitative genetic models to continuously varying traits of intelligence and personality. Results have shown that heredity contributes importantly to variation of these behavioral traits, and that different subcategories of these traits are influenced by heredity in different degrees. Single genes have been shown to determine a number of conditions of mental retardation. The behavioral correlates of chromosome anomalies appear variously to involve specific cognitive and personality functions as well as the gross mental retardation that characterizes some of these conditions. Research on infrahuman animals has shown heredity influence in a wide variety of traits including activity level, alcohol preference, learning, memory, and aggression. Conditions of mental retardation involving amino acidurias have been described in man, and a body of knowledge is coalescing concerning chemical, genetic, chemical, and hormonal as the pathways of genetic influence of animal behavior. Developmental, behavioral genetics and behavioral processes that may be of crucial importance to population genetics are noted.—*Journal abstract.*

4437. Smart, J. L. (1, Manchester, England) Total-and-error behaviour of inbred and F₂ hybrid mice. *Animal Behaviour*, 1970, Vol. 18(1), 147-153. Rats of bar pressing under CRF, partial reinforcement (PRF), and DRL conditions were compared in mice of 2 and F₂ hybrid generation. In all cases pure strains had the highest rate under CRF, the hybrids were most vigorous under PRF and the other pure strains performed better under DRL. Overall, a relatively relevant behavior the hybrid showed intermediate performance either inbred parent strain.—*Journal abstract.*

4438. Smirnov, G. D. (Inst. of Animal Physiology, Morphology & Physiology, Moscow, USSR) Nekotorye aspekty morfologicheskikh izmenenii nervnykh tsentrov v evolyutsii zhivotnykh. Some aspects of morpho-functional changes of nervous centers in animal evolution. In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 160-170. Discusses, in the light of the evolutionary development of the nervous system, the interdependence between functional systems in providing the basic functions of the organism: ensuring the functions of feeding and breathing, ensuring the functions of locomotion and the development of the nervous system. Thus, in the course of the development of the nervous system, the interdependence of functional systems is increasing, and the complexity of the nervous system is increasing. The development of the synaptic connections and the development of the internal organization of the nervous system. A new approach based on the study of the development of the functional CNS and the total dependence of the character of organization of the nervous system upon the character of

their activities in the light of their phylo- and ontogenetic development. (English summary) (30 ref.)—*I. D. London.*

4439. Streng, John. (U. Texas) **The generality of learning differences among inbred mouse strains.** *Journal of Psychology*, 1971(May), Vol. 78(1), 3-9.—Investigated the learning behavior of 10 mice of each sex of 4 inbred mouse strains (A, BALB/c, C57BL/6 and DBA/2) in a wheel-turn avoidance and a maze situation. Several phases of learning were studied and a variety of measures were taken in an attempt to determine whether learning abilities are inherited rather specifically or whether some general learning capacity is transmitted. Significant differences in learning between strains were observed; the rates of learning also were different for several learning measures. The strain rank-order was a clear function of the particular learning situation (appetitive vs. aversive) and also of the particular measure employed. It is concluded that learning ability in the mouse is inherited as a set of independent and rather specific capacities.—*Journal summary.*

PERSONALITY CORRELATES

4440. Häseth, Kjell; Shagass, Charles, & Straumanis, John J. **Perceptual and personality correlates of EEG and evoked response measures.** *Biological Psychiatry*, 1969(Jan), Vol. 1(1), 49-60.—Recorded somatosensory (SSER) and visual evoked responses (VER) and EEG in 40 healthy undergraduates, and related the data to tests of extroversion, neuroticism, intelligence (including the MPI, Eysenck Personality Inventory, and Raven Standard Progressive Matrices of 1958), simple visual perception (letter recognition, line difference discrimination), complex visual perception (closure flexibility, closure speed), and lifted weight discrimination. Results failed to confirm predictions that high evoked response (ER) amplitude would be associated with greater extroversion and poorer perceptual performance. Data did indicate that ER-EEG amplitude concordance, in the sense that both were either high or low, was greater when performance on the simple visual perceptual and weight discrimination tasks was superior. Above average performance on these tasks was also associated with intermediate degrees of EEG frequency dispersion. Trends suggesting that ER-EEG amplitude concordance may differ with respect to the personality, and intelligence tests were also noted. ER-EEG concordance and frequency dispersion appear to be indicators of central regulatory mechanisms with functional correlates in the perceptual sphere. (15 ref.)—*Journal abstract.*

4441. Slaughter, Mary. (U. Illinois) **An analysis of the relationship between somatotype and personality traits of college women.** *Research Quarterly*, 1970(Dec), Vol. 41(4), 569-575.—Compares the results of selected personality traits with the somatotypes of 157 college women with the conviction that biological factors significantly influence human behavior. Somatotypes were determined by the use of somatotype ratings as established by W. H. Sheldon. The personality profiles were determined by 2 personality measuring instruments: (a) the 16 PF, and (b) the CPI. Of the 23 hypotheses which were arbitrarily derived from Sheldon's work on physique and temperament of men, only 1 proved to be tenable. This hypothesis stated that the component of mesomorphy is significantly correlated with the 2nd order Factor I of the 16 PF (low anxiety). (20 ref.)—*Journal abstract.*

NUTRITION & GASTROINTESTINAL PROCESSES

4442. Booth, D. A. (U. Sussex, Lab. of Experimental Psychology, Brighton, England) **An expression of body weight regulation in feeding behavior.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 293.—In an experiment with 6 female hooded rats and 12 faster-growing male albino rats, it was found that the variability of body weight at the time an S started a meal was less than its variability at the end of a meal. It is therefore possible that regulatory signals correlated with body weight more tightly control the duration of intermeal intervals (decay of satiety) than the amount eaten during a meal (initiation of satiety). Ss were tested in a reversed light/dark cycle and given powdered maintenance food for a 3-wk period.—*Journal abstract.*

4443. Borer, Katarina T. (Scripps Inst. of Oceanography, LaJolla, Calif.) **Control of food intake in Octopus briareus Robson.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 171-185.—Studied the role of environmental factors on the control of food intake in 6 experiments with 2 male and 9 female Octopus briareus Robson. Water temperature and crab density were found to exert the most pronounced effect. Food intake doubled with a temperature rise of 10° C and with doubling of crab density. Food intake was unaffected by overeating. Undereating small-size crabs had a weak augmenting effect. Higher percentage of offered crabs was eaten and body weight loss progressively decreased with increasing food deprivations. 2 wk. before egg laying, and subsequently, females reduced their food intake by 50%. Octopus daily food intake appears as a fluctuating visual-acceptance threshold affected by intensity of crab stimulus, food deprivation, and water temperature. (40 ref.)—*Journal abstract.*

4444. Sudakov, K. V. (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Roľ karkovo-podkorkovykh mekhanizmov pishchevoi motivatsii v funktsional'noi sisteme pitaniya.** [Role of the cortical-subcortical mechanisms of alimentary motivation in the functional system of nutrition.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (In PA, Vol. 44:4609) 397-404.—It was shown that the neurophysiological mechanism involved in alimentary motivation is based on the ascending activating influences of the hypothalamic alimentary centers on cortical structures. The influence was clearly manifested in Ss (cats) anesthetized with urethane. The ascending activating influences of the hypothalamic alimentary centers in hungry animals may involve also the mesencephalic reticular formation and the medial thalamic structures. The selective activation of other subcortical structures through influences from the hypothalamic alimentary centers is viewed as demonstrating the existence of a specific ascending activating system to ensure alimentary motivation. (English summary) (18 ref.)—*I. D. London.*

4445. Szantay, I. & Szirmai, E. (Radioisotope Lab., Cluj, Romania) **Incorporation de la ³⁵S-méthionine dans les protéines du foie chez le rat stressé par immobilisation.** [³⁵S-methionine incorporation in liver proteins on the rat under stress induced by restraint.] *Agressologie*, 1970, Vol. 11(5), 427-430.—The administration of ³⁵S-methionine causes the incorporation into proteins not only of the amino acid itself, but also of a definite amount of ³⁵S-cysteine, which depends on the transmethylation reaction in which methionine plays an

important part. To demonstrate the participation of methionine in the mechanism of the general adaptation syndrome in the rat under stress induced by restraint, the degree of incorporation of the 2 sulfur radio amino acids (^{35}S -methionine and ^{35}S -cysteine) was measured in liver proteins after administration of ^{35}S -methionine. In comparison with controls, an increase was noted in the amount of radiocysteine incorporated in liver proteins. These results confirm an earlier hypothesis, i.e., the process of transmethylation, in which methionine plays an important part, is activated in the event of increased demands on the organism. (German, Spanish, & Russian summaries)—*English summary*.

ANIMAL PSYCHOLOGY

COMPARATIVE PSYCHOLOGY

4446. Ambrose, Anthony. (Ed.) (Centre for Advanced Study in the Developmental Sciences, Oxford, England) **Stimulation in early infancy.** London, England: Academic Press, 1969. xvi, 289 p. \$12. Presents proceedings of a conference on the functions of stimulation in early postnatal development, including studies by various authors of both animal and human Ss. Animal studies include rodent-handling experiments and their implications for research with human infants, the mode of action of early stimulation on the developing CNS, the role of genotypic factors in influencing the nature of the long-term effects, and imprinting and the development of preferences. Human studies concern early conditioning, the role of stimulation in early cognitive development, and the effects of mother-infant interaction in establishing the child's behavioral dispositions.

4447. Davenport, John W. (U. Wisconsin, Regional Primate Center) **Species generality of within-subjects reward magnitude effects.** *Canadian Journal of Psychology*, 1970(Feb), Vol. 24(1), 1-7. 12 female pigtail, stump-tail, and squirrel monkeys and 4 female Holtzman albino rats were given acquisition, extinction, and reacquisition training in a discrete-trials 2-lever spatial discrimination situation. In acquisition the left and right levers were associated with 5- and 1-pellet rewards, respectively, and in reacquisition, response to either lever produced 5-pellet reward. The 4 species showed similar patterns of preference for the 5-pellet lever on 2-lever choice trials and differential responding on 1-lever forced trials in acquisition, and similar within-Ss extinction effects which were at variance with the typical crossover of large- and small-reward extinction curves in between-groups reward magnitude studies with rats. Species differences appeared in over-all relative rate of extinction, with the macaques showing the fastest extinction, and in the degree to which historical effects of acquisition conditions appeared and persisted in reacquisition. (French summary) *Journal abstract*.

4448. Garai, László. (Hungarian Academy of Sciences, Inst. of Philosophy, Budapest) **A specifikusan emberi alapszükséglet illogenezisének vázlatja.** [Outline of the phylogenesis of the specifically human basic need.] *Pszichológiai Tanulmányok*, 1968, No. 11, 63-82. —In every living organism 4 basic tendencies of dynamic tension may be found: food-taking, regeneration, aversion, and multiplication. They involve the

input and discharge of various substances: the building up and breaking down of the organism's structural program, but do not in themselves constitute needs. They become needs insofar as they function as motivations for mentally controlled behavior. In such cases, however, they are not aimed solely at the realization of the above tendencies, but also at performing the activity pattern representative of a certain tendency and at performing the objective functions required by the activity. Based on the data of A. N. Leontiev, phylogenesis of the activity structure is reviewed. It is noted that on the higher evolutionary levels, not only the new structure-forming factors but also objects required for their realization become objects of need in animals. This accounts for the evolution of the stage-specific basic need, the dynamic structure of which is determined by the activity pattern of the species, while the class of objects to be acquired at that stage will be delimited by the functions the objects in question play in the activity pattern. In the 4th stage of phylogenesis, the specifically human basic need develops. It is determined by the specific activity of man, i.e., by the pattern of his tool-making activity, and by the specific functions these objects are called upon to perform, i.e., production. English summary

4449. Luckard, Robert B. (U. Washington) **Reflections on the fall of comparative psychology: Is there a message for us all?** *American Psychologist*, 1971(Feb), Vol. 26(2), 168-179. Traces the development of comparative psychology from Darwin's *The Descent of Man* and summarizes widely held premises of the field in the 1950s. The growth of behavioral biology is outlined. 2 principles are distinguished: (a) the principle of phylogenetic relatedness ("behavioral homologies increase in frequency and detail among different animal species as proximity to a common ancestral species increases") and (b) the principle of ecological convergence ("similar behaviors among unrelated forms result from similar selection pressures"). In the light of findings from behavioral biology the premises of comparative psychology are reexamined and found to be false. Implications for comparative psychology, animal laboratories, animal learning, developmental psychology, and human psychology are discussed. It is concluded that comparative psychology clung to a culture of traditions even as they became discredited, and that the time has come for a unification with the natural sciences. (22 ref.) —S. Anapp.

4450. Schachter, Stanley. (Columbia U.) **Some extraordinary facts about obese humans and rats.** *American Psychologist*, 1971(Feb), Vol. 26(2), 129-144. Examined similarities between experimental findings with obese human Ss and exsated hyperphagic rats with obese human Ss and exsated hyperphagic rats. In comparison to normals, obese Ss: (a) eat more of a good- and less of a bad-tasting food; (b) eat fewer meals/day, eat more meal and eat more rapidly; (c) react more emotionally; (d) eat more when food is easy to procure and less when it is difficult; (e) do not regulate food consumption when preloaded with solids, but do when preloaded with liquids; and (f) are less active. N. Mrosovsky's theory that the ventromedial hypothalamus is functionally quiescent in obese Ss is discussed. The function of the hypothalamus is examined. It is hypothesized that obese Ss are stimulus-bound. Experiments reveal that obese Ss: (a) do better on recall tests, (b) respond faster with fewer errors on complex R1 tasks, (c) are more distractible, and (d) work harder for

food when food cues are prominent. Reexamining the activity levels of Ss, it was found that beyond a given stimulus intensity, Ss are more reactive than normals. Difficulties with the comparison and formulation are noted. (38 ref.)—S. Knapp.

4451. Schulze Schenking, M. (U. Münster, Zoological Inst., W. Germany) **Untersuchungen zur visuellen Lerngeschwindigkeit und Lernkapazität bei Bienen, Hummeln und Ameisen.** [Discrimination learning of different color- and form patterns in honeybees, bumblebees and ants.] *Zeitschrift für Tierpsychologie*, 1970(Jul), Vol. 27(5), 513-552.—Honeybees and bumblebees were trained to enter the front hole of a hexagonal area. At the 2 oblique rear walls visual patterns were displayed. Ss found a sugar solution behind the positive pattern which they reached through a small hole in the pattern itself. Colors (yellow vs. blue) were learned faster than patterns. Generalization to a light green vs. a dark green color stimulus were observed: Learning a 2nd pair of colors took longer than a learning task consisting of a striped pattern vs. a black square after a color learning task had been completed. It took the bumblebees 3 times as long to learn the striped pattern vs. the black square combination than the honeybees, but the bumblebees had not learned the green stimuli before, but only afterwards. Even a 4th stimulus combination, a cross vs. a circle, was learned. Ss were able to discriminate all 4 pattern combinations at a time, although the immediate color transfer mentioned above made it somewhat difficult for the honeybees. Memory of the learned tasks lasted for several days (76 ref.)—K. E. Grossmann.

NATURAL OBSERVATION

4452. LaResche, Robert E. & Sladen, William J. (Kenai Moose Research Center, Dept. of Fish & Game, Soldotna, Alaska) **Establishment of pair and breeding site bonds by young known-age Adelle penguins (*Pygoscelis adeliae*).** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 517-526.—From field observations, behavioral data were obtained from 2700 birds over 5 yr., including the observation of 422 breedings by 341 birds from 370 marked nests and flipper banded mates. Early wandering by young Adelles is at first wide and narrows toward the time of 1st breeding. Site of 1st breeding (at the age of 5 yr. in males, 4 yr. in females) is likely to be near the site of hatching. 44% of young breeders change mates and 50% nest site vs. 10% of established breeders who change mates, and 22% who change nest site. Breeding incidence in successive years is significantly lower in young breeders than in adult breeders. Young birds change mate and site during a single breeding season as well as between seasons. The normal population age for faithfulness to site or mate is older than 7 yr.—*Journal summary*.

EARLY EXPERIENCE

4453. Hopf, Sigrid. (Max Planck Inst. für Psychiatrie, München, W. Germany) **Report on a hand-reared squirrel monkey (*Saimiri sciureus*).** *Zeitschrift für Tierpsychologie*, 1970(Jul), Vol. 27(5), 610-621.—The male S was hand-reared from its 19th day until its death at its 61st day. Feeding problems are discussed. Behav-

ioral development continued after physical development had stopped. Adoption attempts failed: there was friendly but not close interaction with lack of maternal behavior. The infant directed infantile behavior patterns toward a substitute: nipple-searching, body investigation, quick approach and clinging when frightened, genital display before climbing on the substitute, and avoidance of soiling the substitute during elimination. Thumb-sucking, which did not occur during normal rearing conditions, was observed. Many social and expressive behavior patterns toward the substitute and toward solid food, which was generally not eaten, were observed.—K. E. Grossman.

4454. Rubel, Edwin W. (U. California, Irvine) **Effects of early experience on fear behaviour of *Coturnix coturnix*.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 427-433. 30 quail poult were exposed to a moving, flashing, and clicking orange cylinder at 5-9 and 10-14 hr. after hatching. Only exposure at 5-9 hr. was effective in reducing distress calls and flight responses. No following or approach behavior was observed in any group. Results also suggest that there is a systematic hierarchy of behavioral responses to novel stimuli in this species. A testable hypothesis was presented which suggests a mutually exclusive set of responses with probabilities of occurrence dependent on the amount of novelty in the stimulus complex of the organism. This hypothesis is amenable to direct experimental testing since both stimulus parameters, novelty, and response parameters, activity and distress calls, can be readily quantified. (21 ref.)—*Journal summary*.

4455. Schulman, A. H., Hale, E. B., & Graves, H. B. (Virginia Polytechnic Inst.) **Visual stimulus characteristics for initial approach response in chicks (*Gallus domesticus*).** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 461-466.—Dark-reared isolated 18-hr-old chickens were presented with alternately approaching and retreating red stimulus discs of 7 sizes between 5-71 cm. diameter. Initially Ss moved toward approaching stimuli rather than followed retreating ones. Response latency and proportion of responding Ss revealed a size preference between 10-20 cm. Results contradict stimulus intensity theory but suggest an optimal range corresponding to biologically appropriate social objects.—*Journal summary*.

4456. Strobel, Michael G., Freedman, Sidney L., & Macdonald, Glenn E. (U. Montreal, Quebec, Canada) **Social facilitation of feeding in newly hatched chickens as a function of imprinting.** *Canadian Journal of Psychology*, 1970(Aug), Vol. 24(4), 207-215.—Describes 3 experiments with cornish × white ruck or white comet × New Hampshire red newly hatched chicks. In Exp. I, it was demonstrated that 12 Ss fed communally gained more weight during a test period than 12 Ss fed in isolation. This effect seemed more pronounced in Ss reared communally. Exp. II showed that 30 communally reared Ss ate very much more, as measured by weight gain, than 30 isolated Ss, but if communal experience was started after Day 3 of life this effect was not observed. However, communally reared Ss that were placed in isolation after Day 3 continued to gain weight at the same rate as those remaining in community. In Exp. III, with 24 Ss, it was found that brief exposures to an artificial imprinting stimulus in the 1st 3 days of life also had a marked facilitating effect on eating in a communal test situation. (French summary)—*Journal abstract*.

INSTINCTS

4457. Bates, Brian C. (U. Oregon) **Territorial behavior in primates: A review of recent field studies.** *Primates*, 1970(Sep), Vol. 11(3), 271-284.—Primate field studies of the last decade have reported much information of relevance for understanding primate territoriality. Material considering the primate use of home range and core areas, intertroop vocalizations, and the relevance of these concepts for the analysis of territorial behavior is reviewed. Several reports of field studies of territorial behavior are included. The data suggests that there are territory-related spacing mechanisms operating in some primate species. However, territorial relations between primate groups are far from universal even among those species which do establish territories; the significance of territoriality will have to be understood as 1 of a number of ecological adaptations. (40 ref.)—*Journal abstract.*

4458. Makarova, A. R. (Pavlov Inst. of Physiology, Leningrad, USSR) **Issledovaniya nekotorykh fiziologicheskikh reaktivnykh novorozhdenykh losей.** [Studies of some physiological reactions of neonate elk.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 241-245.—For 4 elk (up to 20 days of age) an increase in gas exchange, pulse and respiratory rates occurred after sucking milk. After 30 min. these reverted to initial levels. The reactions to odors of indifferent objects were different from the reactions to odors of edible objects. The motor reaction to shade over the head, an inborn property of lambs and kids, was not observed in neonate elk. The study supports the view that research on inborn reactions in the early stages of postnatal life makes it possible to understand the development of UCR reactions and the formation of the natural CRs which determine the adaptation of the animal to the conditions of its surrounding environment.—*I. D. London.*

4459. Núñez, Josué A. (U. Buenos Aires, Faculty of Agriculture & Veterinary, Argentina) **The relationship between sugar flow and foraging and recruiting behaviour of honey bees (*Apis mellifera* L.).** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 527-538.—Attempted to create an experimental arrangement in which an entire hive could be kept under carefully controlled food-flow conditions. Single foragers from this hive were then conditioned to feed at a recording automatic feeder with an adjustable food flow. This feeder was located so that the conditioned bee's behavior could be continuously observed at both the feeder and the hive. The behavior of several such conditioned bees was observed over an extended period of time and under a programmed regime of food flows. It is suggested that the duration and order in which foraging and recruiting behavior occur depends on the relative rewarding of the food source, as measured on the relative rewarding of the food source, as measured by food flow. It is proposed as a hypothesis that the time spent by a bee at a food source or at the hive in each foraging cycle results from a balance between 2 tendencies to stay and to go.—*Journal summary.*

4460. Nyby, John; Thiessen, D. D., & Wallace, Patricia. (U. Texas) **Social inhibition of territorial marking in the Mongolian gerbil (*Meriones unguiculatus*).** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 310-312.—Tested 14 male gerbils for marking frequency in a residents' territory over a number of days. Experimental Ss were allowed contact with 11 male and female residents immediately after each marking trial;

controls were not. Ss exposed to residents eventually decreased their marking to about 25% of control males; however, marking was reestablished in novel territories. Olfactory cues from residents or other intruding males depressed marking. Visual and auditory cues were ineffective. Moreover, odors from the residents' colony were avoided in a Y-tube preference test. Autopsies revealed no evidence for androgen inhibition or stress effects. Evidently, gerbils are territorial and defend their claims primarily by olfactory intimidation.—*Journal abstract.*

4461. Reventlow, Iven. (Copenhagen U., Denmark) **Konfliktforskning: Dyrepsykologisk set.** [Conflict research: Viewed from animal psychology.] *Nordisk Psykologi*, 1969, Vol. 21(5), 335-346.—Following observations of conflict between 2 rutting male sticklebacks (*Gasterosteus aculeatus* L.), a description is given of how the territory of a stickleback can be said to be delimited by various "borders," which, taken separately, obviously do not depend on quite the same factors. Conversely, other observations showed that a certain connection existed between the various "borders" so that if 1 factor of particular significance for 1 certain "border" was altered so that the "border" concerned was displaced, then other "borders" also changed their position after a while. In the stickleback experiments it turned out to be preferable to abstain from a simple causal description of how the individual behavior appeared in an inter-individual conflict and, instead, a probabilistic model is used. The epistemological consequences of such a view are briefly discussed. The probabilistic model was consequently employed for the description of observations concerning how advocates make attempts to reach agreement. Also it has been attempted by use of the model to describe the choice of reaction in foreign affairs. In both cases it has been mentioned how the model could be used to throw new light on these issues.—*English summary.*

4462. Willey, Robert B. & Willey, Ruth L. (U. Illinois, Chicago Circle) **The behavioural ecology of desert grasshoppers: I. Presumed sex-role reversal in flight displays of *Trimerotropis agrestis*.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 473-477.—Using a sound spectrograph in field observations, it was found that both males and females produced distinct acoustic signals (crepitations) during spontaneous and socially induced flight. When disturbed they flew silently. Signaling patterns of this subspecies did not differ in kind from those of other oedipodines.—*Journal summary.*

MOTIVATION & EMOTION

4463. Bolotina, O. P., Rokotova, N. A., Troshikhina, Yu. G., & Nurgaleeva, F. M. (Pavlov Inst. of Physiology, Leningrad, USSR) **Ob orientirovochno-issledovatel'skoi deyatel'nosti u nizishkikh obez'yan.** [On orienting-investigatory activity in the lower simians.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Jeb) Vol. 12, 36-43.—43 lower simians (4 species) of different ages were Ss in a study to (a) elucidate the character of the orienting-investigatory reaction to different nonedible objects, and (b) attempt the formation of CRs on the basis of this reaction. The orienting-investigatory reaction was shown to be closely connected with other UCRs: alimentary, defensive, playful, etc. The latter determined the character of its manifestation. The expression, stability, and intensity of the orienting-

investigatory reaction were, to a considerable degree, a function of the age-specific features of the Ss. The most expressed and steady reaction was observed in adolescent and young sexually mature Ss, in which it bore the character of play. In these Ss it was possible to elaborate stable motor CRs on the basis of the orienting-investigatory reaction. The reaction extinguished much faster than the alimentary. The orienting-investigatory reaction appears to be constantly directed toward securing the adaptive behavior of the animal.—*J. D. London.*

4464. Campbell, Howard W. (Florida State Museum, Gainesville) **Prey selection in naive *Elaphe obsoleta* (Squamata: serpentes): A reappraisal.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 300-301.—Exposed 14 naive hatchling *Elaphe obsoleta* to extracts prepared from prey eaten by young (lizard, frog) and adults (mouse, bird, rat). A preference was shown for the frog (*Hyla*) extract, a favorite food of young of this species. Young will also accept adult prey species provided they are cut into small pieces. This suggests that prey size is an important determinant of the feeding response in this species.—*Journal abstract.*

4465. Cone, Donna M. & Cone, A. L. (Lynchburg Coll.) **Cage activity in cottontail rabbits.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 259-260.—Measured cage activity of 2 American cottontail rabbits twice daily (morning and night) under 6 levels of ambient illumination (dark, less than 1, 2.5, 5, 25, and 50 ft-c). Analysis of variance indicates that the Ss were significantly more active at night than in the morning under all levels of illumination. In addition, the Illumination \times Time of Day interaction was significant. Increasing levels of illumination produced decreasing cage activity at night, but did not significantly affect cage activity in the morning. Results are discussed as providing further generalization of earlier findings with nocturnal Virginia opossum and diurnal California antelope ground squirrels.—*Journal abstract.*

4466. Hsiao, Sigmund. (U. Arizona) **Feeding-drinking interaction: Intake of salted food and saline solutions by rats.** *Canadian Journal of Psychology*, 1970(Feb), Vol. 24(1), 8-14.—Deprived 16 naive female Wistar albino rats of both food and water for 24 hr. and then received 25 combinations of 5 food conditions (no food, 0, .9, 1.8, or 2.7 gm. of NaCl/100 gm plain food) and 5 liquid conditions (no liquid, plain water, .9, 1.8, or 2.7% saline solutions). Each combination of food and liquid was presented for 2 hr. to measure intake of food and liquid. This was followed by a 22-hr recovery period of plain food and water until the next deprivation day began. All Ss were given all 25 conditions in sequences designed to balance possible residual effects. Results indicate: (a) as NaCl concentration in food increased, the amount of intake of water and various saline solutions increased; (b) the rate of increase was greatest for water; (c) when food was presented, water and less-concentrated saline solutions were drunk more, but when there was no food, .9 and 1.8% saline solutions were drunk more than water; (d) food intake was reduced by NaCl content in liquid; and (e) food intake was independent of NaCl concentration in food. Results are discussed in terms of the colligative property of NaCl and the capacity of the rat to concentrate urine. (French summary) (28 ref.)—*Journal abstract.*

4467. Hudgens, Gerald A. **Stress and the adrenocortical response: Enriched past experience re-**

duces the stress response. *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Aug), No. 23-70, 7 p.—Male Wistar rats from 37 1st litters were either handled or not handled on Days 1-15 following birth. In adulthood Ss were exposed for 3 min. to a large open field for 1, 2, 3 or 4 days. 15 min. after the last exposure Ss were sacrificed and free plasma corticosterone was assayed. Handled Ss showed a significantly lower adrenocortical response to the open field than nonhandled Ss. This finding supports the previously reported open-field findings by G. A. Hudgens (see PA, Vol. 46:Issue 3) from these same Ss, which showed that early handled Ss react less emotionally when exposed to a novel environment. The mothers were rebred to rear 2nd and 3rd litters which were not handled in infancy. These litters received 4 days of open-field testing before being sacrificed. No differences were obtained on the corticosterone measure as a function of the mothers' 1st litters being handled or nonhandled. Some methodological difficulties are discussed.—*Journal abstract.*

4468. Hudgens, Gerald A. **Stress and emotional behavior: Enriched past experience reduces emotional response to stress in first and second litter rats.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Aug), No. 22-70, 7 p.—Male Wistar rats from 37 1st litters were either handled or not handled on Days 1-15 following birth. Starting on Day 50 Ss were tested in the open field for 1, 2, 3, or 4 days. Activity and defecation scores were obtained. Handled Ss were less active on Day 1 and more active on Day 4 than nonhandled Ss. The mothers were rebred to rear 2nd and 3rd litters which were not handled in infancy, but which were tested for 4 days in the open field, starting on Day 50. 2nd-litter offspring of mothers whose 1st litter was handled were more active on Day 1 and defecated less over the 4 days of testing than offspring of mothers whose litters were not handled. The effects were similar but considerably reduced for the 3rd-litter offspring. It is concluded that handling a rat mother's 1st litter affects the behavior of her subsequent offspring. Results obtained from 1st-litter Ss fit the traditional emotionality interpretation for the effects of handling, but the results obtained from 2nd-litter Ss suggest that exploratory behavior as well as emotionality may be affected.—*Journal abstract.*

4469. Hutchinson, R. R., Renfrew, J. W., & Young, G. A. (Western Michigan U.) **Effects of long-term shock and associated stimuli on aggressive and manual responses.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 141-166.—Exposed 8 squirrel monkeys to response-independent, fixed-frequency shock that produced biting attack upon a pneumatic hose. Attacks decreased within and across sessions at low intensities and high frequencies of shock, but increased within and across sessions at higher intensities and lower shock frequencies. Stimuli paired with shock, when presented alone, came to produce biting, and stimuli correlated with shock parameters that produced increases in responding within sessions produced similar increases when presented alone. Further experiments with 1, 4, 6, 4, and 2 squirrel monkeys, respectively, showed that continuing exposure to shock also produced lever pressing or chain pulling, with longer shock exposure again producing higher response rates. Whereas biting generally decreased throughout the intershock interval, manual responding generally in-

creased as shock time approached, but immediately before shock was often suppressed. Following shock, biting attack predominated over manual behavior. Results suggest a possible explanation for the extreme resistance of avoidance behavior to extinction, and may also partially explain the persistence of responding during schedules of response-produced shock. Relationships of the present findings to naturalistic observations of relations between fleeing, freezing, and fighting performances are discussed. (65 ref.)—*Journal abstract.*

4470. Ibuka, Nobuo. (Tokyo U. of Education, Japan) **The relationship between visual exploratory behavior and spontaneous activity in rhesus monkeys (*Macaca mulatta*).** *Primates*, 1970(Sep), Vol. 11(3), 201-214.—10 rhesus monkeys underwent a visual exploration test with steady or flickering light as a stimulus. The frequency and cumulative time of peeping or observing responses was measured for each stimulus. Results show that the relative effectiveness of steady or flickering light as an incentive could not be found differentially; the visual stimulus, however, whether steady or flickering light, elicited more peeping responses than the slit without any light, i.e., the operant condition. These peeping responses were rapidly satiated not only within a session, but also between sessions as well as between days. Independent measures of spontaneous activity, obtained concurrently with visual exploration, show that spontaneous activity was relatively stable regardless of ongoing peeping behavior. It was found that 2 measures of frequency and duration on peeping behavior were highly correlated.—*Journal abstract.*

4471. LaBarba, Richard C. & White, Jerry L. (U. South Florida) **Litter size variations and emotional reactivity in BALB/c mice.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 254-257.—Measured emotional reactivity in 36 large- and 36 small-litter BALB/c mice. Each S was tested for 3 consecutive days in an automated open field where 3 dependent measures were obtained: activity level, quadrants traversed, and defecation. Ss reared in large litters exhibited significantly greater emotional reactivity than Ss reared in small litters. Effects were consistent across all 3 indices of emotionality. Results strongly implicate litter size variations as a confounding variable in developmental research with rodents, and may weaken those studies which have failed to control for this variable.—*Journal abstract.*

4472. Myer, James S. (Johns Hopkins U.) **Experience and the stability of mouse killing by rats.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 264-268.—Tested groups of Long-Evans hooded rats for mouse killing with varying intervals between series of tests. The proportion of Ss that killed on the initial test series did not vary with age from 50-200 days. Every S that killed more than 3 mice eventually reached a criterion of killing on 10 successive days, and every S that reached criterion killed consistently when retested after intervals of up to 150 days. Some Ss that did not kill when tested initially did kill when retested, and the proportion of nonkillers which later killed was greater the longer the interval between tests. (17 ref.)—*Journal abstract.*

4473. Niemi, R. Ronald & Thompson, W. R. (U. Manitoba, Winnipeg, Canada) **Effect of age and test situation on reinstatement of fear.** *Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 442-451.—Compared

young with adult rats for reinstatement of fear. Ss were 72 hooded rats, 25 or 70 days old, randomly assigned to each of 3 treatments in groups of 12. Ss received 30 shocks in a black compartment; or this treatment plus single reinstatement shocks at 3 weekly intervals; or reinstatement shocks alone. 1 wk. after the last reinstatement, fear was measured by observing time spent in the shock compartment vs. time in an accessible (nonshock) white compartment. Groups of Ss were tested for active or passive avoidance by placing them 1st either in the shock or in the safe compartment. A reinstatement of fear effect occurred, but only for those Ss treated with original shock plus reinstatement, and then tested in the passive avoidance situation. Although all adults displayed greater fear under all conditions of treatment and test, both adult and young Ss were affected in the same way by these conditions. Results suggest that reinstatement is a somewhat fragile phenomenon and that its importance in the retention of prior experience does not vary with age. (French summary)—*Journal abstract.*

4474. Padilla, A. M. (State University Coll. New York, Potsdam) **Note on frustration theory and the partial reinforcement effect following a few acquisition trials.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 81-82.—Proposes that frustration theory is unable to explain PREs following limited acquisition training. It is suggested that attempts to explain these findings may have implications for conditioning theories in general, and that more attention should be given to the early acquisition process.—*Journal abstract.*

4475. Poley, Wayne; Yeudall, L. T., & Royce, J. R. (U. Alberta, Edmonton, Canada) **Factor analyses of alcohol and water consumption in laboratory mice.** *Canadian Journal of Psychology*, 1970(Feb), Vol. 24(1), 34-41.—Tested 99 mice from 9 different genotypes for 10 consecutive days in a 2-choice situation with drinking tubes containing water and dilute ethanol. Separate recordings of alcohol and water consumption were taken according to the light cycle, at 9:30 AM and 9:30 PM on each day. The 20 measures of alcohol and water consumption were factor analyzed separately by alpha analysis with varimax rotation. 2 factors with eigenvalues greater than 1 were obtained for alcohol and 3 for water consumption. Factors differed strikingly depending on the fluid involved. Water-consumption factors reflected the nocturnal-diurnal activity cycle. Alcohol-consumption factors were related to changes over days but not to the activity cycle. (French summary)—*Journal abstract.*

4476. Rachlin, Howard. (State U. New York, Stony Brook) **On the tautology of the matching law.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 249-251.—The generalized matching law, that organisms divide their time between alternatives in proportion to the value of the reinforcement consequent on the choice, is derivable from the assumption that an organism choosing between alternatives is under no constraints except those the contingencies of reinforcement impose. Hence, the law is not subject to empirical test. Its value lies in its simple codification of assumptions underlying choice experiments.—*Journal abstract.*

4477. Senini, Adriano. (Catholic U., Inst. of Psychology, Milan, Italy) **Il confinamento nello "startling-box" come fattore di frustrazione.** [Confinement in the startling box as a factor in frustration.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1970(Sep), Vol. 31(5), 450-456.—Reports support both a drive and a cognitive hypothesis of frustration.—L. L'Abate.

4478. Streng, John. (U. Texas) **Open-field behavior in four inbred mouse strains.** *Canadian Journal of Psychology*, 1971(Feb), Vol. 25(1), 62-68.—Describes an objective, detailed analysis of the open-field behavior of 4 inbred strains of mice: A, BALB/C, C57BL/6, and DBA/2. During a 20-min period, 400 observations were made of the behavior of an S and scored into categories such as rearing, locomotion, grooming, sniffing at objects, freezing, etc. Significant differences between Ss of different strains were observed with regard to frequency of categories. The changes in frequency over time were strain-dependent for some behaviors. Some acts (e.g., rearing and grooming) occurred more frequently with the passage of time, whereas others changed little or decreased in frequency (e.g., sniffing at objects). The very infrequent occurrence of freezing behavior could not account for the large differences in activity between strains. (French summary)—*Journal abstract*.

4479. Szabó, Imre. (Medical U., Pécs, Hungary) **A megrezzenési (startle) reakció mértékének összefüggése az éhség-drive szintjével patkányoknál.** [Correlation of the intensity of startle reaction with the level of hunger drive in rats.] *Pszichológiai Tanulmányok*, 1968, No. 11, 31-44.—Recorded intensity of acoustic startle reaction in 20 fed rats and in 20 rats kept without food for 24, 48, and 72 hr. The intensity of the reaction was found to correlate negatively with the period of food deprivation (downward trend, $p < .02$). At the same time, repeated experiments have shown that the reaction in Ss deprived of food only for 17-21 hr. is somewhat greater than in fed controls ($p < .10$). Findings refute views based on the experiments of J. S. Brown, H. I. Kalish, and I. E. Farber and that of J. W. Meryman, respectively, who maintain that the intensity of the startle reaction is positively correlated with the arousal level of the motivational system. (Russian summary) (18 ref.)—*English summary*.

4480. Wilton, R. N. & Clements, R. O. (U. Texas) **Observing responses and informative stimuli.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 199-204.—Trained 3 adult homing pigeons on a trial procedure. A trial began with the illumination of a pecking key by a white light. After a fixed interval, a key peck could turn the key to 1 of 2 equiprobable colors and produce a delayed trial outcome—an equiprobable occurrence of either reinforcement or nonreinforcement. After a trial, the key turned dark and the trial ended. The response could be made into an observing response by correlating the key colors with the outcomes. Response rates in the fixed interval then increased to a level greater than when the colors and outcomes were uncorrelated. In another phase, the response produced only the colors. The trial outcomes occurred some sec. after the fixed interval without a response being required. Correlating the colors with the outcomes again increased response rates. In a 2nd experiment with 4 adult homing pigeons, a further condition was added in which reinforcement was the outcome on every trial. Response rates were lower than when there were equiprobable reinforcement and nonreinforcement outcomes with correlated colors, and about the same as when there were equiprobable outcomes with uncorrelated colors. Results suggest that stimuli providing information about the probability of reinforcement are themselves reinforcing.—*Journal abstract*.

LEARNING

4481. Booth, D. A. & Simson, P. C. (U. Sussex, Lab.

of Experimental Psychology, Brighton, England) **Food preferences acquired by association with variations in amino acid nutrition.** *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 135-145.—Protein-deprived rats were given, on 1 day, a balanced mixture of amino acids followed by access to protein-free food having a distinctive odor. On another day, an imbalanced (histidine-free) amino acid mixture was given just before food having another odor. Afterwards Ss preferred the balance-paired odor to the imbalance-paired odor. The preference was acquired whether the duration of odor presentation, or the amount of odorized food taken, was kept constant on the 2 conditioning days. Retention of the preference seemed unattenuated after 4 wk. An attraction to the balance-paired odor (relative to odors paired with a water load) contributed to the acquired preference. There was also a relative aversion to unfamiliar odors when they had been paired with imbalance. Such acquired chemosensory control of preferences, together with an anorexigenic effect of imbalanced amino acid mixtures, can account for characteristics of feeding behavior under conditions in which the diet is deficient in an essential amino acid. (16 ref.)—*Journal abstract*.

4482. Goulet, L. R. (U. Illinois) **Basic issues in reversal-shift behavior: A reply to Kendler and Kendler.** *Psychological Bulletin*, 1971(Apr), Vol. 75(4), 286-289.—Discusses selected nonmediational factors which affect performance on reversal-shift tasks. The factors highlighted are those associated with the logical operation of reversing and the role of implicit associative responses in discrimination-shift tasks involving conceptually related materials. It is concluded that the reversal-shift vs. $\frac{1}{2}$ -reversal-shift is not appropriate for use in assessing the unitary effects of mediation or in a test of a mediational model of development. The joint operation of mediational and nonmediational factors in the execution of the reversal shift are also discussed. (15 ref.)—*Journal abstract*.

4483. Grossmann, Klaus E. (U. Freiburg, Zoological Inst., W. Germany) **Erlernen von Farbreizen an der Futterquelle durch Honigbienen während des Anflugs und während des Saugens.** [Learning of color stimuli at a feeding-site by honeybees during approach, landing and sucking.] *Zeitschrift für Tierpsychologie*, 1970(Jul), Vol. 27(5), 553-562.—Honeybees landed on a transparent cone which was illuminated from beneath with orange light. Upon sucking a 40% sugar solution, the light changed from orange to blue. During choice tests Ss landed on orange cones 75% of the time and approached orange 60% of the time. Control Ss landed and sucked on orange cones. During tests they landed on orange 90% and approached orange 80% of the time. In Exp. II, Ss landed on yellow pieces of cardboard. After landing they were passively carried to a blue one. During tests they landed on yellow 67% and approached yellow 60%. Control Ss landed and sucked on yellow after being passively carried from one to another yellow cardboard. During tests they landed on yellow 100% and approached yellow 90% of the time. When the color during the sucking phase varied from the color present during the landing phase it tended to interfere with learning the color present during approach behavior; the latter color, however, dominated even if there was a delay of 3-10 sec. between landing and reinforcement.—*English abstract*.

4484. Kendler, Howard H. & Kendler, Tracy S. (U. California, Santa Barbara) **Definitely, our last word!**

Psychological Bulletin, 1971(Apr), Vol. 75(4), 290-293.—Argues that the suggestion of L. R. Goulet (see PA, Vol. 46:Issue 3) that 2 rule-based nonmediational mechanisms (doing-the-opposite and frequency cues) can account for developmental changes obtained in reversal vs. $\frac{1}{2}$ -reversal discrimination-shift experiments suffers from several limitations: (a) means of differentiation of mediated and nonmediated mechanisms is not specified; (b) the doing-the-opposite hypothesis fails to account for several reversal-shift phenomena; (c) the data offered in support of the doing-the-opposite hypothesis possess methodological, informational, and logical insufficiencies; and (d) the frequency theory of verbal discrimination as it applies to ontogenetic changes in reversal-shift behavior is not sufficiently developed to be evaluated. It is concluded that although other formulations may prove to be more valid, at present the coordinated single-unit and mediational stimulus-response formulation most adequately integrates the phenomena associated with developmental changes in reversal-shift behavior.—*Journal abstract*.

4485. Miller, N. E. (Rockefeller U., New York, N.Y.) *Dvigatel'noe obuchenie, vistseral'noe obuchenie i gomeostaz*. [Motor learning, visceral learning and homeostasis.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 363-372.—Citing the data of experiments with rats, discusses (a) the ways in which behavioral and physiological mechanisms for maintaining homeostasis, affecting the water balance of the organism, are interrelated, and (b) how both skeletal and visceral responses can be modified by instrumental learning. Thus, direct thermal and chemical stimulation of the brain has been shown to elicit not only the physiological response of secreting the antidiuretic hormone which causes the animal to save water by forming a more concentrated urine, but also the behavioral response of working for and drinking water. It is proposed that, in every case where the homeostatic mechanism acts through the CNS, a deviation from homeostasis functions as a drive and a return toward an optimal level as a reward. When the animals are dehydrated, securing the water that will restore homeostasis serves as a reward to reinforce any responses that immediately precede the drinking of water. In some cases the instrumental learning of visceral responses, reinforced by strong enough rewards, can overcome the innate physiological mechanisms for maintaining water balance and produce at least some deviation from homeostasis. The cited experiments remove 1 of the strongest arguments for a fundamental difference between classical conditioning and instrumental learning. They show that the autonomic nervous system is not inferior to the CNS by being limited to learning by classical conditioning. (English summary) (21 ref.)—*J. D. London*.

4486. Motiff, James P., De Kock, Arlan R., & Davis, Roger T. (U. South Dakota) *Concealment of stimuli during delay in the delayed-response problem*. *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 788-790.—Unless their level of performance on delayed-response problems was very high, 11 rhesus monkeys showed a decrement when the opaque screen of the Wisconsin General Test Apparatus was lowered. This did not occur when the objects were concealed for a comparable period by a small hand screen, suggesting the deficit was due to the signal that lowering the screen meant trial termination.—*Journal abstract*.

Marvin, & Pace, Henry B. (U. Mississippi) *Automatic magazine and bar-press training in the rat*. *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 197-198.

4488. Sonnberg, Andreas & Schmidt-Koenig, Klaus. (U. Göttingen, Zoological Inst., W. Germany) *Zur Auslese qualifizierter Brilleitungen durch Übungsflüge*. [The selection of qualified homing pigeons through exercise flights.] *Zeitschrift für Tierpsychologie*, 1970(Jul), Vol. 27(5), 622-625.—In order to select qualified pigeons for homing experiments all inexperienced Ss were subjected to a sequence of exercise releases. In 4 modified sequences, as in previously used sequences, between 10-20% of the initial number of Ss qualified. The most economical sequence turned out to be one in which the Ss were released, for the 1st $\frac{1}{4}$ of the sequence, in flocks from rapidly increasing distances without change of direction. The releases most difficult for the Ss (i.e., causing high losses) were those between 20 and 70-130 km. in distance. This result represents additional evidence that homing appears to be more difficult from these distances than from shorter or longer distances.—*English abstract*.

Conditioning

4489. Adamec, Robert & Melzack, Ronald. (McGill U., Montreal, Quebec, Canada) *The role of motivation and orientation in sensory preconditioning*. (*Canadian Journal of Psychology*, 1970(Aug), Vol. 24(4) 230-239. Explored the effect of hunger on sensory preconditioning. Ss were 17 male cats. An appetitive task was used to test for sensory preconditioning effects in order to avoid complications arising from differences of drive state during preconditioning and testing for preconditioning. It was found that hunger facilitated the association between paired auditory and visual stimuli, but not between stimuli presented separately and in random order. Examination of the orientation responses of Ss during preconditioning indicate that the auditory stimulus becomes an arousing cue that signals the onset of the visual stimulus. It is suggested that the orientation responses produced as a consequence of this cue function are responsible for the association of the auditory and visual stimuli. (French summary) (19 ref.) *Journal abstract*.

4490. Baru, A. V. (Pavlov Inst. of Physiology, Leningrad, USSR) *Sledovye uslovnye refleksy u krol'kov*. [Trace conditioned responses in rabbits.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 14-21.—15 2-yr old rabbits were Ss in a study of trace motor-alimentary and defensive-shaking CRs with delays ranging from 30 sec to 6 min. These reflexes were evaluated by the magnitude of their latent period and by the distribution of response reactions during the time of the stimulus action and that of the delay. The latter appeared to be the most essential. Reinforcement could be delayed from 30 sec to 3-4 min. for elaborating trace CRs. Correct reckoning of time appeared more distinctly when use was made of alimentary-motor conditioning.—*J. D. London*.

4491. Burdina, V. N., Melikhova, E. F., Krasuskaya, N. A., & Bystrov, V. V. (Pavlov Inst. of Physiology, Leningrad, USSR) *Tipologicheskie osobennosti vyshego nervnogo deyatel'nosti sobak porody russkaya gonchaya*. [Typological features of higher nervous activity in dogs of the Russian hound breed.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(1 Feb), Vol. 12,

44-49.—Presents the results of determinations of the typological features of higher nervous activity in 13 Russian hounds, a relatively new breed of dog. Type of nervous system was determined by inspection of the salivary CRs, utilizing the basic "minor standard" tests. Variations in higher nervous activity were encountered principally in the equilibration and lability of the nervous processes, although with respect to behavior and strength of the basic nervous processes, the breed tends definitely toward the homogeneous.—*I. D. London.*

4492. Chebykin, D. A. (Pavlov Inst. of Physiology, Leningrad, USSR) **Raspredelenie intensivnosti dvigatel'nykh reaktsii kak vozmozhnyi pokazatel' pri sravnitel'nom izuchenii sledovykh uslovnykh pishchevykh reflektsov.** [Distribution of intensity of motor reactions as a potential index in the comparative study of trace alimentary conditioned responses.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 178-185.—5 unrestrained dogs were Ss in a study to substantiate the applicability of the distribution law of reaction intensity to motor-alimentary CRs, using as indices of CR activity (a) latent periods of general and local motor reactions (approach and bar-pressing for food, respectively), (b) the rate of bar-pressing during the delay prior to reinforcement, and (c) the distribution of time spent holding the pedal down. Increase in bar-pressing and in the duration thereof as reinforcement time neared reflected the intensity of local motor reaction in the presence of a trace reflex. The distribution of duration of single bar-pressings/min during the delay prior to reinforcement was the most effective index of the trace motor reflexes under study. This index is basic; that for reaction latencies is supplementary.—*I. D. London.*

4494. Fedorov, V. K. (Pavlov Inst. of Physiology, Leningrad, USSR) **K voprosu o starcheskikh izmeneniyakh v uslovno-reflektornoi deyatel'nosti myshei.** [On senile changes in conditioned-response activity in mice.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 292-296.—Presents the results of a study of the divergencies observed in the CR activity of old and young mice. Motor-alimentary CRs to a bell and light were used. In the case of old Ss, CR activity was characterized by greater variability, a sharp decline of magnitude, and more marked dependence on experimental conditions. It is suggested that, at the basis of the observed decline of CR activity, there are: (a) a growth of inertness of the nervous processes, manifested in the slow establishment of the optimal functional level of the nerve cells; and (b) a narrowing of the range of optimal alimentary excitability. In order to procure a higher level of CRs in old Ss, it was necessary to increase the intervals between stimuli and the time between experimental sessions.—*I. D. London.*

4495. Kettlewell, Neil M. & Papsdorf, James D. (U. Montana) **A role for cutaneous afferents in classical conditioning in rabbits.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 239-247.—Severe attenuation of cutaneous afferent activity from the orbital region of the eye during training prevented development of the classically conditioned nictitating membrane response in New Zealand white

rabbits. Afferent activity levels were controlled by corneal applications of a local anesthetic (.5% tetracaine hydrochloride), varying UCS locus, and by exerting mechanical tension on the eyelids. To determine if learning or performance was affected by such "deafferentation," 3 groups were trained under low levels of afferent activity for 3, 6, or 15 days. When subsequently given additional training under higher levels of afferent input, Ss performed no better than did naive Ss. Results indicate that the reduction in cutaneous afferent activity had prevented learning. (27 ref.)—*Journal abstract.*

4496. Khudorozheva, A. T. (Pavlov Inst. of Physiology, Leningrad, USSR) **K voprosu o razviti differentsirovannogo i ugastatel'nogo tormozheniya u sobak v ontogeneze.** [On development of differential and extinctive inhibition in dogs in ontogenesis.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 321-329.—16 17 day to 6 mo. old puppies were Ss in a study of the mechanism involved in the transformation of diffuse generalized forms of reflex reactions into rapid, precise motor acts, utilizing positive and negative defensive CRs to auditory stimuli. The ability to develop differential and extinctive inhibition was shown to grow with age. Differentiation became more stable with age and after 3 mo. it became possible to form absolute differentiation. In the process of elaborating both kinds of inhibition in the motor and autonomic components of the CR reaction, dissociation appeared, expressed with special sharpness in the younger puppies. Differential and extinctive inhibition were earlier elaborated in the motor components and later in the autonomic component. Earlier primitive forms of motor and autonomic reactions appeared in the process of extinguishing the CR in puppies up to the age of 3 mo. Restoration of a CR against this background led to their elimination. (17 ref.)—*I. D. London.*

4497. Kobakova, E. M. (Pavlov Inst. of Physiology, Leningrad, USSR) **Formirovanie zapazdyvayushchikh uslovnykh reflektsov v ontogeneze u sobak.** [Formation of delayed conditioned responses in ontogenesis in dogs.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 219-229.—25 puppies (starting at the age of 2-3 wk.) and 4 adult dogs were Ss in a study which employed delayed (20 sec. to 3 min.) secretory-alimentary and acidic-defensive CRs to a tone over a 6-7 mo. period. Formation of the processes of internal inhibition in the early period of growth (1.5-4 mo.) proceeded with difficulty and was entirely unstable. In the beginning inhibition developed in the motor and afterwards in the secretory components of the delayed CRs. The formation of CRs in 3-5 mo. old puppies was accompanied by the development of sleep inhibition. The degree and duration of this inhibition were functions of the age and individual features of the Ss. By the 5th-6th mo. sleep inhibition either decreased or diminished and the delayed CRs displayed the character of those in adults. The dynamics of formation and the speed of formation of the alimentary and acidic-defensive CRs proceeded similarly and within the same periods of growth.—*I. D. London.*

4498. Kornorski, J. (Nencki Inst. of Experimental Biology, Warsaw, Poland) **Znachenie kharaktera uslovnykh razdrashitelei v raznykh formakh differentsirovki.** [Significance of the character of conditioned stimuli in various forms of differentiation.] In V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh

funktsii." (See PA, Vol. 44:4609) 338-343.—Experiments with dogs showed that 2 forms of training exist for differentiation: (a) "food-no food," and (b) "go left-go right." In "food-no food" differentiation, where 1 auditory CS was positive and another one was negative, the nature of the stimuli played a decisive role. In "go left-go right" differentiation, where 1 auditory CS elicited 1 instrumental response and the other one a 2nd response, the training was based on the orienting responses produced by each of these stimuli. As a result, when the stimuli were presented from different places, training for this differentiation was easy; when the stimuli were presented from the same place, it was extremely difficult, even if the qualitative difference between the stimuli was great. It is suggested that (a) direct potential connections do not exist between the auditory analyzer and the kinesthetic analyzer, and (b) the motor response, elicited by each CS, must, therefore, be mediated by an appropriate orienting response. (English summary)—I. D. London.

4499. Krasuskaya, N. A. & Firsov, L. A. (Pavlov Inst. of Physiology, Leningrad, USSR) *Issledovanie otsrochennykh reakttsii i korotko-otstavlennykh uslovnykh refleksov u nizshikh obez'yan v techenie polovogo tsikla.* [Study of delayed reactions and briefly lagging conditioned responses in lower simians in the course of the sexual cycle.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 71-76.—Sexually mature female baboons were Ss in a study to evaluate, over a 4-wk period, slightly lagging motor CRs and delayed reactions—the latter also when superimposed upon the action of pharmacological agents possessing a sedative or excitatory character. Delayed reactions in Ss underwent regular changes in connection with the sexual cycle, while the motor CRs were distinguished by stability. Extended dosage of bromines facilitated the percentage increase of correct choices in the execution of delayed reactions in the beginning and final phases of the sexual cycle. Subcutaneous injections of a 10% solution of 1.2 ml. sodium benzoic caffeine exerted no noticeable influence on the state of delayed and briefly lagging CRs, studied during the course of the sexual cycle.—I. D. London.

4500. Levinthal, Charles F. & Papsdorf, James D. (U. Michigan) *The classically conditioned nictitating membrane response: The CS-US interval function with one trial per day.* *Psychonomic Science*, 1970(Dec), Vol. 21(5), 286-297.—Determined acquisition rates for the classically conditioned nictitating membrane response of the rabbit, using 1 paired presentation of tone and shock/day for 12 days, in 24 male New Zealand rabbits trained at a CS-UCS interval of either 250 or 1250 msec. Although both groups displayed substantial conditioning, the 1250-msec group was significantly superior to the 250-msec group, in marked contrast to the usual findings of experiments dealing with the CS-UCS interval parameter. Results are interpreted primarily in terms of the role of the orienting response in CR acquisition.—*Journal abstract.*

4501. Lukina, E. V. (Pavlov Inst. of Physiology, Leningrad, USSR) *K voprosu o razviti uslovno-reflektornoï deyatel'nosti vorob'inykh ptits v ontogeneze.* [On the development of conditioned-response in finches in ontogenesis.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 234-240.—Canaries were used to study alimentary and defensive conditioning in ontogenesis. This was possible

from the 6th-10th postincubational day. The CRs, however, were unstable and disappeared by the next day. The 1st half of the period as nestlings was characterized by (a) the gradual development of the motor coordinations of the alimentary reflex, and (b) an extension of the range of its unconditioned stimulation as a result of the functional inclusion of new analyzer systems. The 2nd half was characterized by a diminution of this range as a result of (a) the formation of CR-alimentary connections with the parents, and (b) the sharp extension of the range of stimuli eliciting the unconditioned passive-defensive reaction of "freezing," which in time was replaced by active flight from the nest. During the period when freezing may take place, the same UCS elicited 2 reactions: in the beginning a defensive reaction with an alimentary one following immediately.—I. D. London.

4502. Mackintosh, N. J. (Dalhousie U., Halifax, Nova Scotia, Canada) *An analysis of overshadowing and blocking.* *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 118-125.—In classical aversive conditioning experiments, rats do not always learn about all aspects of a compound stimulus predicting shock. A strong stimulus may overshadow a weaker one; and pretraining on 1 component may block learning about a 2nd component. These results have been explained either by appealing to a notion of selective attention, or by assuming that learning about 1 component is a function of prior response strength to the entire compound of which it forms a part. In Exp. I (N = 40 male hooded rats), overshadowing was demonstrated on the 1st trial of conditioning, i.e., before either component had acquired any response strength. In Exp. II (N = 30 male rats), pretraining on 1 component resulted in complete failure to learn about a 2nd component during compound training, but did not prevent additional learning about the 1st component. Both results were interpreted as supporting an attentional analysis of blocking and overshadowing. (17 ref.) *Journal abstract.*

4503. Miczek, Klaus A. & Grossman, Sebastian P. (U. Chicago) *Positive conditioned suppression: Effects of CS duration.* *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 243-247. During a brief CS (15 or 30 sec.) that terminated with the response-independent delivery of banana pellets, operant responding reinforced by other food pellets according to a variable-interval schedule of reinforcement was suppressed in 2 squirrel monkeys. CSs of longer duration (1, 2, and 3 min.) did not reliably affect the rate of operant performance. Brief CSs generated homogeneous response patterns of nearly complete suppression. Increasing the CS duration did not enhance responding, as previously reported, but led to alternate bursting and pausing, which suggested a loss of control by the CS. Results suggest that the magnitude of "positive" or "negative" conditioned suppression reflects the strength of the classical conditioning process. *Journal abstract.*

4504. Millenson, J. R. & Dent, Jill G. (Oxford U., England) *Habituation of conditioned suppression.* *Quarterly Journal of Experimental Psychology*, 1971(Feb), Vol. 23(1), 126-134.—Investigated habituation of CIR using a procedure which eliminated contaminating temporal discriminations. 3 rats were trained to bar press on a random-interval 60-sec schedule of milk reinforcement and variable duration tone-shock pairings. Very little recovery from conditioned suppression was found over

60 sessions of testing and no systematic differences were found after a month's "vacation" from the procedure. Analysis of responding within the CS period showed uniform suppression. Data are discussed in terms of stimulus predictability. (17 ref.)—*Journal abstract.*

4505. Pavlov, B. V. (Pavlov Inst. of Physiology, Leningrad, USSR) **Sledovye pishchevye uslovnye refleksy u golubei.** [Trace alimentary conditioned responses in pigeons.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 96-103.—10 domestic pigeons were used to study the formation and dynamics of alimentary trace reflexes with different lengths of delay (5 sec. to 6 min.) and repeated application of a photic CS. With repeated application of the photic CS, stable alimentary-motor trace CRs with a marked inhibitory phase were formed comparatively quickly (in the course of 2-4 experimental sessions). In small trace delays (5 sec.), motor CRs took place mostly during the time of action of the CS. With increase in the delay to 15 and 30 sec., the relationship between "immediate, immediate-trace, and trace" motor CRs changed in the direction of a decrease in immediate reactions and a growth of trace reactions. In delays of 1, 3, and 6 min. almost all the motor CRs became trace CRs.—*I. D. London.*

4506. Poulos, Constantine X., Sheafor, Patrick J., & Gormezano, I. (U. Iowa) **Classical appetitive conditioning of the rabbit's (*Oryctolagus cuniculus*) jaw-movement response with a single-alternation schedule.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 231-238.—Conducted 3 experiments with a total of 144 male and female albino rabbits to evaluate the implied generality of E. J. Capaldi's aftereffects concept. The effects on single-alternation behavior (SAB) of 1-, 10-, and 20-cc water UCSs, and of the factorial manipulation of 2 levels of CS duration (.5 and 15.05 sec.) on reinforced (R) and nonreinforced (N) trials, were assessed. It was found that SAB: (a) did obtain a classical appetitive conditioning, (b) was an increasing function of UCS magnitude, and (c) was significantly facilitated by increased CS duration on N but not on R trials. It is suggested that the effects of reward on magnitude and duration of goal-box stimuli on SAB in instrumental appetitive-conditioning paradigms may be similarly mediated by classical appetitive CRs.—*Journal abstract.*

4507. Prazdnikova, N. V. (Pavlov Inst. of Physiology, Leningrad, USSR) **K kharakteristike sledovykh uslovnykh reflektsov u ryb.** [On the characteristics of trace conditioned responses in fish.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 134-143.—6 crucian carp with previous experience in conditioning experiments and 5 without such experience were used to study trace motor and electrodefensive CRs, respectively, in order to determine the dynamics of formation of the former (delays in reinforcement: gradually up to 3, 4, 5 min.) and that of the latter (delay of reinforcement: gradually up to 1.5 min.). Trace alimentary CRs with delays of 45-285 sec. could be formed. The character of trace CRs was (a) not changed on disturbance of the experimental stereotype, brought about by a change in order of presentation of the CSs; and (b) not affected even when CSs, evoking immediate CRs, were introduced into the experiment. Trace alimentary CRs in the fish were found to be (a) specific with respect to the kind of CSs used, and (b) specific to the location of the conditioned signal. In a 90-sec delay

the number of trace defensive CRs can reach 99% of all reactions in some fish. With the same delay of reinforcement, the inhibitory phase in trace defensive CRs was considerably shorter than for the alimentary. The reason for this is attributed to the conditions of the experiment.—*I. D. London.*

4508. Quinsey, Vernon L. (Dalhousie U., Halifax, Nova Scotia, Canada) **Conditioned suppression with no CS-US contingency in the rat.** *Canadian Journal of Psychology*, 1971(Feb), Vol. 25(1), 69-82.—Presented CS to rats licking sucrose after 1 of several off-the-baseline Pavlovian defense conditioning procedures. 2 random procedures in which there was no CS-UCS contingency were constructed by programing CS and UCS on independent random schedules which had either a long or a short variable inter-CS interval (VITI). Ss were 48 naive male Sprague-Dawley rats in Exp. I and II and 20 rats from Exp. II in the 3rd experiment. Because the CS took up more of the session in the short VITI procedure, it contained more CS-UCS pairings and produced CS-elicited suppression of licking. Suppression occurred with neither the long VITI group nor with shock alone controls. Conditioning was all-or-none after both classical and random procedures. (French summary)—*Journal abstract.*

4509. Schastnyi, A. I. (Pavlov Inst. of Physiology, Leningrad, USSR) **Fiziologicheskie mekhanizmy dinamiki obrazovaniya slozhnogo povedeniya chelovekoobraznykh obez'yan (shimpanze).** [Physiological mechanisms involved in the formational dynamics of complex behavior in anthropoid apes (chimpanzees).] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 152-162.—3 chimpanzees were Ss in a study which made use of positive and inhibitory motor CRs involving key-fitting to open locked boxes. These reflexes were united into complex sequential chains or functional systems, providing the form for different behavioral acts. A definite level of complexity in the behavioral acts was found to be in correspondence with the complexity of elaborated differentiated inhibition. Functional systems of conditioned connections that had been formed and differentiations elaborated with respect to them developed with gradually growing complexity. Of special interest is the fact that, if a required key were hidden in a pile of other keys, the chimpanzee would engage in an active search through the pile for it in order to insert it in the corresponding lock.—*I. D. London.*

4510. Schastnyi, A. I. (Pavlov Inst. of Physiology, Leningrad, USSR) **Vzaimodeistvie funktsional'nykh sistem mozga u antropoidov.** [Interaction of functional systems in the anthropoid brain.] *Trudy Instituta Fiziologii imeni I. P. Pavlova*, 1968(Feb), Vol. 12, 144-151.—3 chimpanzees were Ss in an investigation, using motor CRs, of the physiological mechanisms involved in the formation and interaction of different cerebral functional systems lying at the basis of complex forms of behavior. The single CRs which were elaborated came to be mutually interconnected and patterned into different systems of conditioned-unconditioned connections proceeding in the form of complex behavioral acts. A certain degree of excitation in 1 of the unconditioned centers could be attained by means of satiation, hunger, etc.—something that was revealed in the functional systems formed of conditioned-unconditioned connections. The interaction of different functional systems was attained by concentrating excitation or inhibition in 1 of them, with the subsequent devel-

opment of induction. The latter promoted the appearance of 1 or another functional system and the electivity of excitatory propagation along formed pathways, thus, securing the adequacy of anthropoid behavior in a complex experimental setting.—I. D. London.

Discrimination

4511. Bowen, Richard W. & Nevin, John A. (Columbia U.) **Discrimination and generalization with an alternative response.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 681-682.—Pigeons could obtain reinforcement for pecking 1 key independently of a discrimination procedure arranged on another key. The availability of this alternative response seemed to alter the functional properties of the discriminated stimuli as evidenced during subsequent generalization tests, but did not affect the usual behavioral characteristics of discrimination acquisition. In particular, the training conditions produced behavioral contrast but postdiscrimination peak shift and inhibitory stimulus control were not observed. These phenomena normally are correlated in the acquisition of stimulus control by simple successive discrimination training. The alternative response can itself come under the control of the stimulus dimension associated with the discriminated response, thus providing an additional behavioral metric for the experimental analysis of discrimination learning.—*Author abstract*.

4512. Dinsmoor, James A., Browne, Michael P., Lawrence, Charles E., & Wasserman, Edward A. (Indiana U.) **A new analysis of Wyckoff's observing response.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 679-680.—When allowed to produce discriminative stimuli for grain-reinforced key-pecking by standing on a pedal, 3 pigeons maintained green illumination of the key (which accompanied a random interval schedule of reinforcement) for a greater portion of the time it was available than they did red (which accompanied extinction.) As a result of this selective sampling, the average frequency of reinforcement was higher in the presence of these stimuli than when S was off the pedal. Therefore, there seems to be no need to hypothesize a factor like "information" to account for the reinforcement of observing behavior.—*Author abstract*.

4513. Gossette, Robert L. (Hofstra U., Comparative Animal Behavior Lab.) **Variation in magnitude of negative transfer on successive discrimination reversal (SDR) tasks across species.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 803-811.—Notes the isolation of the dimensions of successive discrimination reversal (SDR) methodology which make it sensitive to interspecies performance differences that have systematic taxonomical significance. 2 particular dimensions are indicated: inconstancy of reinforcement and the maximum opportunity for the generation of negative transfer. To determine if variation in magnitude of negative transfer is diagnostic of phyletic level, indices were studied across different phyletic levels of birds: 5 White Leghorn chickens, 4 trumpeters, 4 Guinea fowls, 4 White King pigeons, and 3 Himalayan magpies. More "primitive" birds developed greater magnitudes of negative transfer than more "advanced" birds. The relevance of the data to the retention decrement and the differential extinction hypotheses is examined. (16 ref.)—*Journal abstract*.

4514. Hearst, Eliot. (Indiana U.) **Differential transfer of excitatory versus inhibitory pretraining to intradimensional discrimination learning in pigeons.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 206-215.—12 groups of 4 naive female White Carneaux pigeons received different kinds of pretraining. All Ss had to master a successive discrimination between 2 lengths of a vertical line projected on the response key. Ss pretrained with differential reinforcement for responses to the positive stimulus of the forthcoming discrimination (but with no exposures to the negative stimulus) acquired the discrimination much faster than Ss pretrained with extinction for responses to the negative stimulus of the discrimination (but with no exposures to the positive stimulus). The latter group was not consistently superior to single-stimulus or extradimensional control groups. Group differences are interpreted in terms of differential response levels created along the line-length dimension by the various kinds of pretraining. (21 ref.)—*Journal abstract*.

4515. Johnson, Daniel F. & Anderson, William H. (Virginia Polytechnic Inst.) **Generalization gradients around S₂ following errorless discrimination learning.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 298-300. 4 naive White King cock pigeons were shaped by an errorless procedure to discriminate a blank key as S₁ and a key lit by 576 normal modulation as S₂, and then discrimination training continued on a multiple random-interval 1-min extinction schedule before generalization tests were conducted on wavelength and intensity dimensions. Generalization gradients along wavelength were flat at 0 response rate, while intensity generalization gradients were sloped to high response rates at low intensities. Implications for defining generalization of inhibition are drawn.—*Journal abstract*.

4516. Mackintosh, N. J. & Little, Lydia. (Dalhousie U., Halifax, Nova Scotia, Canada) **An analysis of transfer along a continuum.** *Canadian Journal of Psychology*, 1970(Oct), Vol. 24(5), 362-369. 10 white carneaux pigeons trained on an easy wavelength discrimination subsequently performed more accurately on a hard wavelength discrimination than did 10 controls trained on the hard problem from the outset. The effect was not a simple consequence of learning an easy problem, for a 3rd group (N=10), initially trained on the hard wavelength discrimination but with a 2nd relevant dimension added, performed no more accurately than controls. Nor was it due to a greater difference in response strengths to the stimuli of the hard problem, since a 4th group (N=10), initially trained on the reversal of the easy problem, eventually performed more accurately than controls. A 2nd experiment with 20 white carneaux pigeons of the same age, further disconfirmed this 2nd analysis, leaving it probable that the basic result is partly a consequence of the strengthening of attention to the relevant dimension. (French summary) *Journal abstract*.

4517. Matyniak, Kenneth A. & Stettner, Laurence J. (U. Sussex, England) **Reversal learning in birds as a function of amount of overtraining.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 308-309. 40 male adult bobwhite quail were given 80, 240, 400, 640, or 2000 overtraining trials after learning a simultaneous visual-pattern discrimination and were then reversed. Reversal performance after all levels of overtraining either did not differ from or was significantly inferior to that of 8

nonovertrained birds. Failure to obtain an overtraining reversal effect was attributed to the fact that overtraining did not reduce responding to an irrelevant position dimension.—*Journal abstract.*

4518. Stoddard, L. T. & Sidman, Murray. (Massachusetts General Hosp., Boston) **Stimulus control after intradimensional discrimination training.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 147-157.—Trained 4 rhesus monkeys on intradimensional discrimination initially at distant and then at near points on circle-ellipse continuum. The training did not necessarily produce good stimulus control \times test-stimulus differences smaller than the original training values. It is concluded that the original controlling stimulus-response relation did not correspond with the relations being evaluated by the generalization test.—*Journal abstract.*

4519. Swenson, Leland C. (Occidental Coll.) **One versus two discrimination by whiteneked ravens (*Corvus cryptoleucus*) with non-number dimensions varied.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 454-460.—3 Ss were trained to respond to the number concept of 1 (represented by a red circle on white background) for food, while the number concept of 2 (2 red circles) remained unrewarded. Area, pattern, position, extraneous noise, odor, and visual cues were controlled. 1 S suddenly reached 90% correct criterion after 640 trials of chance performance and showed good transfer of stimuli to new colors and shapes. 1 S gradually reached 75% correct in over 1000 trials, as if the S had been responding to area cues. The 3rd S remained at chance level apparently responding to both position preference and area cues. Suppression of responding to partially reward-correlated information may be a necessary condition for acquisition of abstract concepts. (19 ref.)—*Journal summary.*

4520. Telegdy, Gabor A. & Cohen, Jerome S. (U. Windsor, Ontario Canada) **Cue utilization and drive level in albino rats.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 248-253.—Trained 32 male albino rats under either a moderate or high water-deprivation level. Ss did not differ in their acquisition rate of a simultaneous discrimination task in which 2 redundant dimensions were present. Test trials in which only 1 of the dimensions was present revealed that moderately deprived Ss were more able to utilize both cue dimensions than highly deprived Ss. A drive-counterbalancing procedure was used to show that the inverse relationship of drive level and cue utilization was based primarily on training rather than testing deprivation level. Cue-utilization differences between drive levels appear to be learning rather than only a performance effect.—*Journal abstract.*

4521. Ward, Jeannette P. & Yehle, Arthur L. (Memphis State U.) **Cross-modal reversal in the rabbit.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 261-263.—Established a classically conditioned discrimination between 2 rates of intermittent stimulation in the auditory modality for 4 New Zealand albino rabbits and in the visual modality for 4 additional rabbits. Following acquisition in the original modality, both stimulus modality and stimulus contingencies were changed in a cross-modal reversal test. All Ss were subsequently tested in reacquisition of the original discrimination. Results are compared to a previous test of direct cross-modal transfer. It is concluded that results of cross-modal reversal support the earlier finding of cross-modal transfer in the rabbit.—*Journal abstract.*

4522. Williams, Ben A. (Colorado Coll.) **Color alternation learning in the pigeon under fixed-ratio schedules of reinforcement.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 129-140.—Trained 8 White Carneaux pigeons on a nonspatial delayed alternation task in which the correct stimulus was that color not responded to on the preceding trial. Ss required to emit either 15 or 30 pecks to the correct stimulus within a trial learned the task; those required to emit only 1 or 5 pecks did not. Also, alternation was learned more easily after an incorrect than after a correct trial. Later experiments with the same Ss showed that a minimum fixed-ratio was required for successful color alternation to occur, even though no fixed-ratio requirement was necessary when a position cue was available. The mechanism of the fixed-ratio effects derived from the Ss' tendency to repeat their response in the presence of the color reinforced on the last trial. Whereas Ss trained on larger fixed-ratios corrected this error tendency within a trial, Ss trained on smaller fixed ratios did not.—*Journal abstract.*

Avoidance & Escape

4523. Baum, Morrie; Jaffe, Peter G., & Leclerc, Robert. **The effect of a loud buzzer upon the acquisition and extinction of a simple avoidance response in rats.** *Canadian Journal of Psychology*, 1971(Feb), Vol. 25(1), 24-32.—Bishop's U., Lennoxville, Quebec, Canada—Describes 2 experiments to determine the effect of a loud buzzer on avoidance acquisition and extinction in rats. In Exp. I with 66 naive female hooded rats, a 2×3 factorial design was employed, in which the buzzer was introduced as a redundant CS in a simple avoidance situation, with different groups being trained at different CS-UCS intervals. Having the buzzer as CS hastened acquisition and increased resistance-to-extinction of the avoidance response. The effect of CS-UCS interval was also significant, as were many interaction effects. In Exp. II with 44 naive female hooded rats, the buzzer was introduced for the 1st time in extinction, i.e., after the response had been acquired. If the buzzer was introduced as a redundant "CS," it increased resistance-to-extinction. If the buzzer was applied continuously during extinction or only during the ITI, it tended to make the Ss extinguish more quickly. (French summary)—*Journal abstract.*

4524. Bresnahan, Elaine L. & Riccio, David C. (Kent State U.) **Effects of variations in stimulus similarity and response requirement during pre-shock upon subsequent one-way active avoidance learning.** *Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 427-433.—Describes 2 experiments with 48 adult male Holtzman albino rats, which examine further the stimulus and response conditions under which prior fear conditioning facilitates 1-way active avoidance acquisition. Fear in both experiments was established during passive avoidance training by administering a single 2-sec shock following a cross-through response from a white to a black compartment. Subsequent active avoidance acquisition was facilitated in Exp. I even though the response requirements of the 2 tasks were incompatible. In Exp. II reversed stimulus-shock arrangements existed in the 2 learning tasks. Facilitation of avoidance acquisition as a function of the prior task was again obtained. (French summary) (15 ref.)—*Journal abstract.*

4525. Cicala, George A., Masterson, Fred A., & Kubitsky, Grace. (U. Delaware) **Role of initial response rate in avoidance learning by rats.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 226-230.—Measured shuttle responses in the absence of response-contingent reinforcement for different periods of the intershock interval (ISI) with different intensities of signaled and unsignaled shock. In Exp. I with 30 male Wistar rats, a CS was employed. Responding was directly related to shock intensity early in the ISI and inversely related to shock intensity late in the ISI (during the CS). In Exp. II with 30 male Wistar rats, no CS was presented and the same interaction was obtained. Results (a) permit an interpretation of the inverse relation between shock intensity and shuttle-avoidance learning in terms of initial response probability, and (b) suggest that CS introduction increases the shuttle-response probability immediately preceding shock.—*Journal abstract.*

4526. Crawford, M. L. (Baylor Coll. of Medicine, Houston, Tex.) **Shock-avoidance and shock-escape drinking in rats: Rate of licking.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 304-305.—Measured the drinking rates in 6 albino and hooded rats by interresponse times for licking under shock-avoidance or shock-escape contingent licking conditions. Interresponse times were quite comparable under either set of shock-contingent drinking conditions with the modal interlick interval approximately 145 msec. Well-established principles of behavior maintained on fixed ratio schedules would predict such results.—*Journal abstract.*

4527. Gibbon, John. (New York State Psychiatric Inst., New York) **Scalar timing and semi-Markov chains in free-operant avoidance.** *Journal of Mathematical Psychology*, 1971(Feb), Vol. 8(1), 109-138.—Proposes scalar timing as the basic latency mechanism underlying asymptotic free-operant avoidance performance. Timing in free-operant schedules results in a semi-Markov chain, in which transition times may depend on the state to be entered as well as the state occupied. Results for finite chains on asymptotic state occupancy probabilities are summarized, and an explicit solution for the mean 1st passage time matrix is derived. Applications of these results using the scalar property provide a 1st-order description of mean interresponse and intershock time functions for a variety of cued and uncued free-operant schedules. Occasional deviant performances appear to result from the standard scalar timing mechanism with infrequent random breakdowns. (31 ref.)—*Journal abstract.*

4528. Gilbert, R. M. (Alcoholism & Drug Addiction Research Foundation, Toronto, Ontario, Canada) **Signal functions in discriminated avoidance behavior.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 97-108.—Trained 4 male hooded rats to lever press under a discriminated avoidance/escape schedule in which separately signaled safe and escape periods were 100 and 32 sec., respectively. The auditory and not the visual component of the compound warning signal became associated with the discriminative control of lever pressing. Avoidance behavior also came under temporal control, in that the probability of lever pressing increased as the warning period progressed. Timing began with the onset of the warning signal rather than the offset of the safe signal. However, after the warning signal had been progressively eliminated, timing began with the offset of the safe signal. When neither

signal was normally available, the temporal distribution of avoidance behavior changed markedly. Drifts in the temporal distribution of lever pressing occurred throughout the study; these were manipulated for 2 Ss. (43 ref.)—*Journal abstract.*

4529. Halasz, Michael F. & Lindsay, Gary M. (U. Manitoba, Winnipeg, Canada) **Servomechanistic oscillation of a vestibular conditioned response after impulse-like incrementation of US intensity.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 677-678.—In vestibular escape, rats terminated externally initiated aversive tilt-oscillation of the chamber by discrete-trial bar press. Response latency to tilt onset became a stable function of UCS intensity (tilt frequency). Impulse-like (abrupt, brief) changes of UCS intensity elicited transient excursions of this performance measure. The impulsive transients appeared similar to servomechanistic damped oscillations even though the paradigm included no external loop arranged by reinforcement contingencies. The interpretation is that S maintains the total accelerational stimulus at a regulated value by compensating changes in tilt frequency with reciprocal adjustments of response latency, via a feedback pathway inside S.—*Author abstract.*

4530. Henderson, Norman D. (Oberlin Coll.) **Motivation-performance relationships using different shock-avoidance shuttlebox techniques.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 314-315.—Trained 112 naive male Wistar rats on either a running or a barrier-jumping shuttlebox avoidance task over a wide range of shock levels. Performance changed relatively little across shock levels on the running task and was U-shaped on the jumping task. Early escape performance was a strong determinant of avoidance performance at some shock levels. The overriding effects of specific situational factors in the shuttlebox must be considered when the instrument is used for the study of motivation-performance relationships.—*Journal abstract.*

4531. Kadden, Ronald M. (Columbia U.) **Response-dependence and predictability of shock as continuous variables.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 707-708. Probability of shock delivery may be manipulated independently for responses or failures to respond (not-responses). When these probabilities are programed within a temporal system of reinforcement schedule classification, they provide a parametric basis for relating schedules of response-dependent and response-independent shock, and for varying shock predictability. Lever-press responding was studied in 16 rhesus monkeys, using probability schedules on avoidance extinction. It was found that response rates increased as both the relative response-independence and predictability of shock values were increased.—*Author abstract.*

4532. Krasnegor, Norman A., Brady, Joseph V., & Findley, Jack D. (Walter Reed Army Inst. of Research, Washington, D.C.) **Second-order optional avoidance as a function of fixed-ratio requirements.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 181-187.—2 rhesus monkeys responded on a fixed-ratio schedule in Stimulus 1 (blue light) to avoid the onset of Stimulus 2 (green light). Failure to avoid Stimulus 2 required a 2nd fixed-ratio performance to avoid Stimulus 3 (red light) in the presence of which unavoidable shock occurred. Relative frequencies of

avoidance performance in the blue light and in the green light were inversely related to the ratio requirement under each stimulus condition. Both differential response-cost and avoidance-failure probability factors were related to the observed changes.—*Journal abstract.*

4533. Maxian, Paul M. & Igarashi, Makoto. (U. Houston) **Baseline rail-running performance in the squirrel monkey.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 959-965.—Describes an avoidance rail-running test for squirrel monkeys. It permitted measurement of base-line motor performance for study of balance. The effect of several amounts of pretraining on base-line level was investigated, and no differences in base-line level were found. Factors including avoidance acquisition and initial rail-running ability were normally distributed. The stability of rail-running performance was adequate for use as a base-line measure.—*Journal abstract.*

4534. Posluns, Donald & Vanderwolf, C. H. (U. Western Ontario, London, Canada) **Improved avoidance performance following exploratory movement.** *Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 499-504.—Acquisition of 1-way active avoidance is improved by about 40% by (a) exploration in the avoidance apparatus immediately before training; (b) exploration in an irrelevant, empty box immediately before training; (c) a single ECS 24 hr. before training; and (d) a combination of a and c. Exploration in the avoidance apparatus 24 hr. before training did not improve avoidance acquisition. Ss were 69 naive male hooded rats. It is suggested that the effect of exploration on active avoidance performance is due to a "warm-up" of diencephalic-limbic mechanisms concerned with the control of motor activity. (French summary) (17 ref.)—*Journal abstract.*

4535. Powell, Robert W. (U. South Florida) **Free-operant (Sidman) avoidance in field-raised and laboratory-raised wild rats.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 216-225.—Studied avoidance learning in 12 cotton and 8 black rats, 9 of which had been raised in the field and 11 in the laboratory. The majority of the Ss learned to avoid, with the laboratory-raised Ss performing as successfully as a group of 10 albino rats. Feral Ss performed more inconsistently both within and between Ss, with the field-raised Ss differing significantly from the albino Ss in this respect. Both feral species displayed stereotyped UCR to electric shock which appeared to compete with the avoidance response, and had to be suppressed before effective avoidance developed. In most cases, this required intense electric shocks. The albino Ss consistently received a disproportionately large number of shocks early in the session (warm-up), while neither feral species displayed this tendency.—*Journal abstract.*

4536. Pritchatt, Derrick. (U. Leeds, England) **Further studies on the avoidance behaviour of *Periplaneta americana* to electric shock.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 485-492.—Conditioned leg dipping into water in cockroaches at 20 or 60 μ A for 6 or 20 min.; Ss were then tested for retention during extinction. The higher shock intensity resulted in poorer performance during acquisition and extinction. 6 min. of training were insufficient for learning. The attempt to establish light as a secondary reinforcer resulted in deterioration of performance. Reversal learning did not improve over trials. (26 ref.)—*Journal summary.*

4537. Riess, Dave. (Galesburg State Research Hosp. Ill.) **The buzzer as a primary aversive stimulus: II Unavoidable buzzer presentations and conditioned acceleration.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 302-304.—2 experiments explored the effects of a 76-db buzzer on Sidman avoidance. In Exp. I with 3 female Wistar rats with a history of avoidance, it was shown that a variable interval 1 schedule of unavoidable 2-sec buzzer presentations would increase avoidance rates during entire 30-min sessions. In Exp. II with 4 naive female Wistar albino rats, it was shown that conditioned acceleration could be produced when a light CS predicted a 5-sec buzzer UCS. Both these effects were small in magnitude but highly reliable, and both effects attenuated rapidly when the buzzer was removed.—*Journal abstract.*

4538. Rohrbaugh, Michael; Brennan, James F., & Riccio, David C. (Kent State U.) **Control of two-way shuttle avoidance in rats by auditory frequency and intensity.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 324-330.—Following acquisition by 15 male albino Holtzman rats of shuttle-avoidance responding to a tonal CS, 6 Ss were given stimulus generalization tests under each of 3 conditions: (a) variation of frequency, (b) variation of intensity, and (c) concurrent variation of both frequency and intensity. Resulting generalization gradients for the frequency-alone dimension show that response speed was greatest when the training-CS value was presented, with a decrement in response strength occurring to the other stimuli. Variations in the intensity dimension alone revealed a monotonic relationship between response speed and stimulus intensity. Simultaneous variations in both frequency and intensity indicate that both dimensions exerted behavioral control, and that frequency gradients tend to steepen as intensity increased. Results are interpreted with respect to aversively motivated stimulus control and multidimensional stimulus generalization. (28 ref.)—*Journal abstract.*

Reinforcement

4539. Ayres, John J. & Quinsey, Vernon L. (U. Massachusetts.) **Between-groups incentive effects on conditioned suppression.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 294-296.—Rats licking 12% sucrose suppressed to a preaversive CS as much as those licking 8%, but recovered their base-line response rates faster following shocks. It is suggested that an earlier finding by J. R. Vogel and N. L. Spear, of greater suppression under low incentive, could have been due to the use of a recovery time measure of suppression—a measure that confounds CS-elicited suppression with rate of recovery of base-line responding. 60 male albino Sprague-Dawley rats were Ss.—*Journal abstract.*

4540. Davis, Jennifer & Bitterman, M. E. (U. South Florida) **Differential reinforcement of other behavior (DRO): A yoked-control comparison.** *Journal of Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 237-241.—After training to press a lever on a variable interval 30-sec schedule, 1 group of 10 naive hooded rats was shifted to a differential-reinforcement-of-other-behavior (DRO) 10-sec schedule, while a 2nd group was shifted to a noncontingent yoked-control schedule that provided the same frequency and distribution of reinforcement. Then, both groups (Total N = 10) were extensively retrained on the variable-interval schedule.

after which the 1st was shifted to a series of DRO 30-sec sessions alternating daily with variable-interval 30-sec sessions, while the 2nd was treated like the 1st on variable-interval days and yoked with the 1st as before on DRO days. In both phases, response-decrement was more rapid and more marked in the DRO Ss than in the controls. The difference was due largely to sustenance of response in the controls by adventitious reinforcement. All the DRO Ss developed "other" behavior—the same distinctive pattern of waiting at the foodcup—but there was no direct evidence that it contributed in any way to the decrement in lever pressing.—*Journal abstract*

4541. Lolordo, Vincent M. (U. North Carolina, Chapel Hill) Facilitation of food-reinforced responding by a signal for response-independent food. *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 49-55.—5 male White Carneaux pigeons whose key pecking was maintained by 4-sec access to grain on a variable-interval 2-min schedule received Pavlovian differential conditioning trials superimposed upon the instrumental base line. The CSs were changes in the stimulus on the key from white to red, or to a white horizontal line against a dark background. The positive CS was 20 sec. long, and was followed immediately by 8-sec access to grain. The negative CS, also 20 sec. long, was never paired with response-independent food. All Ss responded more rapidly in the presence of the positive CS than in the presence of the negative one. The positive CS produced an increase in response rate over the preconditioned stimulus period. The negative CS had no marked effect upon response rate. When the roles of the positive and negative stimuli were reversed, and the duration of the response-independent reinforcement was reduced to 4 sec., the new positive CS came to facilitate responding, and the new negative CS no longer produced facilitation. A 2nd discrimination reversal produced similar outcomes. When a 3rd reversal was initiated, and the duration of response-independent reinforcement was reduced to 2 sec., the difference between the effects of the positive and negative stimuli diminished. (17 ref.)—*Journal abstract*

4542. Weinstein, Lawrence. (U. Melbourne, Victoria, Australia) Negative incentive contrast effects with saccharin vs. sucrose and partial reinforcement. *Psychonomic Science*, 1970(Dec), Vol. 21(5), 276-278.—30 male hooded rats received 7 sessions of barpress training with sucrose (16 or 4%) and saccharin (.10 or 1.5%) as reward, followed by a shift from 16-4% sucrose and 10-1.5% saccharin. 4 dependent measures indicate that concentrations of sucrose and saccharin that produced equivalent levels of performance produced equivalent negative contrast effects. In Exp II, 18 Ss received 4 sessions of barpress training with (.10 or 1.5%) saccharin under a fixed ratio 7 schedule of reinforcement followed by a shift from .10-1.5%. 4 of the 5 measures indicate negative contrast effects. Confounding inherent in the use of solid food or sucrose does not appear to account for negative incentive contrast effects. —*Journal abstract*

Reinforcement Schedule

4543. Brandon, Paul K. (Mankato State Coll.) A reinforcer-density-change schedule of reinforcement. *Proceedings of the Annual Convention of the*

American Psychological Association, 1971, Vol. 6(Pt. 2), 689-690.—A rat was run on a reinforcement schedule where the consequence of lever pressing was a shift from a specified interval from a low reinforcer density condition to a high reinforcer density. The delivery of reinforcers was not contingent upon behavior. Responding was maintained at a higher rate than under a control condition providing completely noncontingent reinforcement at the same density as that maintained by a higher reinforcer density change condition. It is concluded that positive reinforcement is best defined as an increase in reinforcer density consequent to behavior, resulting in an increased frequency of occurrence of that behavior.—*Author abstract*

4544. Brownstein, Aaron J. (U. North Carolina, Greensboro) Concurrent schedules of response-independent reinforcement: Duration of a reinforcing stimulus. *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 211-214.—Determined presentations of grain to 3 adult White Carneaux pigeons by 2 response-independent schedules. Interpresentation intervals varied with a mean interval of 1.5 min. for each schedule. Both were concurrently operative, but grain was presented by 1 only when the chamber was illuminated with blue light and by the other only during amber illumination. A response on a white key, the only key in the chamber, alternated the stimulus conditions and the effective schedule. Grain presentation durations associated with the illumination conditions were varied from 1.5-4.5 sec. The proportion of the total session time spent in an illumination condition closely approximated the relative grain presentation duration provided in that illumination. For 2 of the Ss, the proportion of the total number of grain presentations obtained in an illumination condition was an increasing function of the presentation duration in that illumination.—*Journal abstract*

4545. De Lange, John. (U.S. Naval Aerospace Medical Research Lab., Pensacola, Fla.) The effects of brief stimuli presented under a multiple schedule of second-order schedules. *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 19-25.—Investigated the effects of briefly presented stimuli paired or not paired with food reinforcement in 4 male adult White King pigeons on a multiple schedule containing 2nd-order schedules. A stimulus paired with food reinforcement was presented on a variable-interval schedule in 1 unit of the multiple schedule and either a stimulus not paired with food reinforcement or no stimuli were scheduled in the other unit. Response rates were highest when behavior was followed by the food-paired stimulus. Presentation of the food-paired stimulus at completion of each 1-min variable-interval component maintained a steady rate of responding between consecutive food presentations. Pausing following food reinforcement was greatest in the 2nd-order schedule not containing the paired stimulus. Reversing the stimulus pairings or by a reversal of the response rates and patterns of responding for each stimulus.—*Journal abstract*

4546. Donaldson, Ralph I. & Schull, Richard I. (U. North Carolina, Greensboro) The effects of prefeeding on a response-initiated DRL schedule of reinforcement. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 695-696.—4 rats were trained on a 2-response DRL schedule. The 1st response turned on a light and the 2nd

response turned off the light. If the time between the responses exceeded 20 sec., the 2nd response produced food. If the time between the responses was less than 20 sec., food was not presented and another initiating response was needed to start the DRL. The mean latency of the terminating response increased slightly for 2 of the Ss during prefeeding sessions. The mean latency of the initiating response increased markedly for all 4 Ss during prefeeding.—*Author abstract.*

4547. Gibbon, John & Eaton, Charles R. (New York State Psychiatric Inst., New York) **Choice between responding and not responding on an appetitive "Sidman-like" schedule.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 713-714.—Studied the choice between responding and not responding in rats in an appetitive schedule analogous to a free-operant avoidance paradigm. The schedule programs reinforcement at a constant time (s) from the preceding reinforcement when no response intervenes. When a response occurs, reinforcement follows at a different constant delay (r). Response probability was a decreasing function of r for a fixed value of s. All Ss showed a bias away from an optimum strategy which would maximize reinforcement density.—*Author abstract.*

4548. Hymowitz, Norman. (Rutgers State U.) **Comparison between FI and VI schedules of punishment: Response suppression.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 709-710.—A 2×2 design was used to compare response suppression in rats following fixed interval (FI) and variable interval (VI) schedules of punishment. A general trend toward greater suppression for FI punishment in Exp. I ($N = 12$ male rats) failed to obtain statistical significance. Exp. II ($N = 12$ male rats), however, revealed significantly more suppression for FI than for VI schedules of punishment. The difference between the 2 studies was attributed to clearer specification of the minimum intershock interval in Exp. II. The data suggest that periodicity of shock may be an important determinant of response suppression.—*Author abstract.*

4549. Jones, Cora L., Schull, Richard L., & Brownstein, Aaron J. **The effect of a variable-interval changeover contingency on concurrent responding.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 693-694.—Previous studies using concurrent variable-interval (VI) schedules have indicated that when a changeover delay is used, the distribution of responses approximates the distribution of reinforcements. In the present experiment with 4 adult white Carneaux pigeons, a VI contingency imposed on the changeover resulted in large discrepancies between these distributions. These results are in agreement with other procedures that impose contingencies on the changeover that separate the main-key behavior from the changeover behavior.—*Author abstract.*

4550. Kop, Pieter F. & Snapper, Arthur G. (Franklin D. Roosevelt Veterans Administration Hosp., Montrose, N.Y.) **Responding and heart rate under temporally defined schedules of signalled electric shock.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 703-704.—Employed a contingency space consisting of the continuous and independent variables of probability of shock given a response during a stimulus and probability

of shock given no response, in the stimulus. Behavioral and cardiac effects in the rhesus monkey were obtained under discriminated avoidance, Pavlovian conditioning avoidance extinction, discriminated punishment, and intermediate cases defined by variations in the 2 probabilities. When the probability of shock given a response was greater than probability of shock given no response, response rate in the stimulus was suppressed.—*Author abstract.*

4551. Lachter, G. D., Cole, B. K., & Schoenfeld, W. N. (Queens Coll., City U. New York) **Response rate under varying frequency of non-contingent reinforcement.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 233-236.—Exposed 2 White Carneaux hen pigeons to a 60-sec random-interval base-line procedure. 6 different exteroceptive stimuli were successively correlated, within a single session, with blocks of 10 reinforcement presentations. Following this training, a noncontingent reinforcement procedure was instated with interreinforcement intervals of 5, 15, 30, 60, 120, and 240 sec. Within a single session, each noncontingent frequency was correlated with 1 of the previously presented discriminative stimuli. After an initial increase in the rate of responding as the result of a high density of noncontingent reinforcements, the rate declined as exposure to each noncontingent frequency was prolonged.—*Journal abstract.*

4552. Marr, M. Jackson. (Georgia Inst. of Technology) **Sequence schedules of reinforcement.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 41-48.—Studied the performance of 3 naive White Carneaux pigeons under a 2nd-order schedule composed of fixed-interval (FI) components, each of which was associated with a different discriminative stimulus, the stimuli occurring in a fixed order. In 1 condition, food presentation followed the completion of the 4th component. This was designated a fixed-ratio sequence schedule. In another condition, responses in the 1st component completed after a fixed time were reinforced. This was designated a FI sequence schedule. Although the stimulus order and maximum reinforcement frequency were identical under the 2 schedules, considerably more responding occurred under the FI sequence schedule in all components. Relatively few food presentations occurred after responding during any but the terminal components of the FI sequence schedule, a feature independent of the parameter values investigated. In addition, while a pattern of increased responding between food presentations prevailed under both schedules, under the FI sequence schedule the rate in the terminal component was frequently less than in the penultimate component. The FI sequence schedule appeared to have several properties of simple FI schedules. (15 ref.) *Journal abstract.*

4553. Meehan, J. T., Sewell, W. R., & Cooper, A. M. (California State Coll., San Bernardino) **Comparison of chained and tandem schedules of reinforcement.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 15-25.—Compared the performance of 6 silver king pigeons on —chained and tandem variable interval-fixed ratio (VI-FR) and VI-DRL schedules of reinforcement. In the FR and VI-DRL schedules, varying the value of the FR or DRL chained schedules, varying the value of the FR or DRL schedule in the final component seemed to have little effect on the rate of responding in the initial component. When a FR schedule was programmed in the final component, consistently higher rates of responding were found in the initial component of the tandem schedules

when compared to the chained schedules. However, when a DRL schedule was programed in the final component the opposite effect was observed, i.e., consistently lower rates of responding were observed in the initial component of the tandem schedule when compared to the chained. Results seemed to indicate that separate factors were controlling performance in the chained and tandem schedules.—*Journal abstract.*

4554. Sette, William F. & Wood, Ronald W. (U. Rochester, School of Medicine & Dentistry) **Stochastic reinforcement of response duration.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 675-676.—3 dogs were exposed to a schedule of reinforcement which determined the probability of reinforcement as a linear function of response duration. The slope of this function was parametrically manipulated and related to measures of central tendency of the distributions of response durations and interresponse times. As the slope of the function decreased, response durations increased, and vice versa. These findings indicate that response durations as well as interresponse times are subject to control by stochastic reinforcement contingencies.—*Author abstract.*

4555. Shanab, Mitri E. & McCuiston, Sharron. (Fresno State Coll.) **Effects of shifts in magnitude and delay of reward upon runway performance in the rat.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 264-266.—42 naive male Sprague-Dawley rats in 6 independent groups were 1st trained in a runway to receive either 1 or 12 pellets after a 0-, 15-, or 30-sec delay (Phase 1). Subsequently (Phase 2), all Ss received 12 pellets under the same delay interval as in Phase 1. Finally (Phase 3), all Ss were delayed 15 sec. before receiving the 12-pellet reward. In Phase 1 performance was a positive function of amount of reward and a negative function of delay of reward. The effects of magnitude and delay of reward were independent of each other. In Phase 2 no elation effects were obtained in the 0-, 15-, or 30-sec delay conditions. A depression, but not an elation, effect was obtained in Phase 3.—*Journal abstract.*

4556. Shimp, Charles P. & Wheatley, Kimbal L. (U. Utah) **Matching to relative reinforcement frequency in multiple schedules with a short component duration.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 205-210.—3 White Carneaux pigeons performed on 2-component multiple variable-interval variable-interval schedules of reinforcement. There were 2 independent variables: component duration and the relative frequency of reinforcement in a component. The component duration, which was always the same in both components, was varied over experimental conditions from 2 180 sec. Over these conditions, the relative frequency of reinforcement in a component was either .2 or .8 ($\pm .03$). As the component duration was shortened, the relative frequency of responding in a component approached a value equal to the relative frequency of reinforcement in that component. When the relative frequency of reinforcement was varied over conditions in which the component duration was fixed at 5 sec., the relative frequency of responding in a component closely approximated the relative frequency of reinforcement in the component. i.e., the familiar matching relationship, obtained previously only with concurrent schedules, was obtained in multiple schedules with a short component duration.—*Journal abstract.*

4557. Shull, Richard L. (U. North Carolina, Greensboro) **Sequential patterns in post-reinforcement pauses on fixed-interval schedules of food.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 221-231.—Responding by 1 of 2 adult male Silver King pigeons was reinforced with food on fixed-interval (FI) schedules of 30-, 60-, and 300-sec duration. A 2nd S was studied under FI durations of 60 and 300 sec. For both Ss, the average postreinforcement pause was $1/2$ the duration of the FI. Autocorrelation coefficients revealed 1st-order sequential dependencies in series of postreinforcement pauses. On the 300-sec FI schedule successive postreinforcement tended to alternate between long and short durations. At the shorter FI durations there was less evidence of alternation sequences. Exp. II with the same Ss was conducted to determine if the time intervals between the 1st response after reinforcement and the next reinforcement (the work periods) were responsible for the alternation patterns in the series of postreinforcement pauses. To evaluate the role of the work period, several procedures were used to modify the work period from that obtained on the FI 300-sec schedule. Adding a schedule to the FI schedule that set the minimum amount of time that could elapse between the 1st response after reinforcement and the next reinforcement eliminated the alternation pattern. Control schedules indicate that the elimination of alternation patterns resulted from constraints on the work period per se and not from confounded changes in the interreinforcement intervals. (22 ref.)—*Journal abstract.*

4558. Snapper, Arthur G., Schoenfeld, William N., & Shimoff, Elliot H. (Franklin D. Roosevelt Veterans Administration Hosp., Montrose, N.Y.) **Varying temporal location and intensity of an added electrical stimulus in a fixed-interval schedule.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 705-706.—After 4 groups of rats were trained on a fixed-interval 3-min schedule of positive reinforcement, a 15-sec mild electric shock was intruded into different segments of the interval. When the shock occurred in the beginning, middle, or 3rd quarter of the interval, each S showed a positively accelerated response rate until shock, followed by a 2nd positively accelerated curve up to the reinforcement. When shock immediately preceded reinforcement, rates early in the interval were decreased. As shock intensity increased, response and reinforcement rate decreased differentially according to the temporal locus of shock.—*Author abstract.*

4559. Squires, Nancy & Fantino, Edmund. (U. California, San Diego) **A model for choice in simple concurrent and concurrent-chains schedules.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 27-38. Responses of 8 adult White Carneaux pigeons in the presence of 2 concurrently available (initial-link) stimuli produced 1 of 2 different (terminal-link) stimuli. Entrance into the mutually exclusive terminal links was arranged by different and independent variable-interval (VI) schedules for each key, while responses during the mutually exclusive terminal-link stimuli produced a single food reinforcement according to identical and independent VI schedules. Ss emitted more initial-link responses on the key with the shorter average interreinforcement interval in the initial link. This difference in initial-link response rates varied directly with the difference between the

average interreinforcement intervals of the initial-link schedules and decreased when the initial-link schedule with the longer average interreinforcement interval was followed by several consecutive food reinforcements on the VI schedule in the terminal link on that key. Results are incompatible with previous formulations of choice behavior with the concurrent-chains procedure. A modified formulation with a multiplier for the overall rate of primary reinforcement obtained on each key provides a better description of choice. The new formulation also applies to behavior in simple (concurrent) choice situations, an advantage not achieved by previous formulations. (18 ref.)—*Journal abstract*.

4560. Tombaugh, T. N. (Carleton U., Ottawa, Ontario, Canada) **A comparison of the effects of immediate reinforcement, constant delay of reinforcement, and partial delay of reinforcement on performance.** *Canadian Journal of Psychology*, 1970(Aug), Vol. 24(4), 276-288.—Investigated the relation between immediate reward, constant delay of reward, and partial delay of reward in 3 experiments with 149 naive female Sprague-Dawley rats. A discrete operant bar-press apparatus was employed. In Exp. I, constant delay produced less resistance to extinction than either immediate reward or partial delay, which were not different from each other. Changing the delay contingencies from training to extinction did not substantially influence performance. Exp. II showed that resistance to extinction was an increasing function of the length of the delay interval (7.5, 15, 30, or 45 sec.) in a partial-delay paradigm, and Exp. III demonstrated that resistance to extinction was a decreasing function of a constant delay interval (15, 30, or 45 sec.). Results are discussed in the context of A. Amsel's frustration theory and E. J. Capaldi's sequential hypothesis. (French summary) (23 ref.)—*Journal abstract*.

4561. Winton, A. S. & Beale, I. L. (U. Auckland, New Zealand) **Peak shift in concurrent schedules.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 73-81.—Exposed 6 experimentally naive White King pigeons to 2 keys, a main key and a changeover key. Initially nondifferential training was given in which pecking the main key was reinforced on a variable-interval (VI) 2-min schedule when the key displayed the 1st stimulus, a black line on a blue background, and was reinforced on an identical but independent VI 2-min schedule when the key displayed a plain blue stimulus. Later, differential training was given in which pecking the main key was reinforced on a VI 2-min schedule when the 1st stimulus was displayed; and was reinforced on a VI 10-min schedule when a 2nd stimulus, a black line of another orientation on a blue background, was displayed. During nondifferential and differential training, each peck on the changeover key changed the stimulus on the main key. Generalization tests were given before and after the differential training. These consisted of presentations on the main key of 7 orientations of the black line on the blue background, including the 1st and 2nd stimuli, with no reinforcements being given. Changeover-key pecks changed the stimuli on the main key. Generalization gradients were obtained using 3 measures: time spent, responses, and response rate in the presence of each test stimulus. Typically, maximum values on these measures occurred to stimuli away from the 1st in a direction opposite the 2nd stimulus, and minimum values occurred to stimuli away from the 1st in a direction opposite the 1st.—*Journal abstract*.

Punishment & Extinction

4562. Alcock, John. (U. Washington) **Punishment levels and the response of black-capped chickadees (*Parus atricapillus*) to three kinds of artificial seeds.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 592-599.—3 groups of chickadees were presented with sunflower seed shells empty, containing salted meal worms, or containing meal worms contaminated with quinine sulphate, over 3 days of trials. Ss initially rejected the emetic quinine worm most, the salted worm nest, the empty shell not at all. After 8 presentations the empty seed was also left untouched. Following a 6-day pause the salted worms were eaten significantly more often than before. The rapid and stable avoidance of the empty and emetic seeds may be attributed to the absence of any food reward. It is the nutritive value of a prey rather than its associated punishing qualities which will determine the degree of protection from predation enjoyed by that prey.—*Journal summary*.

4563. Baum, Morrie. (Bishop's U., Lennoxville, Quebec, Canada) **Extinction of an avoidance response in rats via response prevention (flooding): A test for residual fear.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 203-208.—Trained 80 female hooded rats, in a 2 x 2 factorial design, to avoid either .5 or 1.3 ma. shock in an automated apparatus. Following acquisition, Ss were extinguished with or without response prevention. Results confirm that response prevention is effective in hastening the extinction of an avoidance response. Following extinction, the application of a loud buzzer induced a recovery-from-extinction of the response in all groups, indicating that residual fear was present in all groups and roughly to the same extent. Various theoretical implications are discussed. *Journal abstract*.

4564. Dardano, J. F. (Johns Hopkins U., Medical School) **Control of concurrent avoidance and appetitive behaviors by an indicator of shock proximity.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 167-180. Exposed 2 monkeys to concurrent schedules in which every 5th response on 1 lever had the dual consequences of delivering food and stepping a 20-step light counter upward; responses on a 2nd lever stepped the light downward. By responding appropriately on each lever, a ration of food could be obtained without exposure to a brief shock that occurred when the counter reached the 20th step. Behavioral patterns of light-counter control were analyzed when the Ss were handicapped by several types of discontinuities in the 20-step counter: (a) different sets of 4 consecutive lights inoperative, (b) the upper or lower 10 steps inoperative, and (c) all lights inoperative. Generally, Ss maintained the light in the upper 5 steps of the 20-step light counter if the lights immediately preceding the shock position were functional. However, when these counter positions were inoperative, Ss maintained the counter around the highest operative position. With all positions of the light counter inoperative, no systematic pattern of responding on the food and avoidance levers occurred.—*Journal abstract*.

4565. Dawson, Ronald G. (U. California, School of Biological Sciences, Irvine) **Retrograde amnesia and conditioned emotional response incubation reexamined.** *Psychological Bulletin*, 1971(Apr), Vol. 75(4), 278-285.—Examines the CER incubation hypothesis advanced by A. A. Spevak and M. D. Suboski (see PA. Vol. 43:12407). Spevak and Suboski reviewed the

evidence bearing upon the nature of the retroactive effects of ECS upon learned responses, and proposed an interpretation for the wide variety of retrograde amnesia gradients reported in the literature. They suggested that the "true" retrograde amnesia gradient occupies only several seconds following learning, and that longer retrograde amnesia gradients reflect, not an ECS effect upon memory, but the halting by ECS of the incubation, i.e., change-over time of an experimentally produced CER. The evidence for this interpretation is considered weak. An explanation of the wide variety of retrograde amnesia gradients, in terms of treatment effectiveness, is put forward as a more reasonable alternative. (40 ref.)—*Journal abstract.*

4566. Furumoto, Laurel. (Wellesley Coll.) **Extinction in the pigeon after continuous reinforcement: Effect of number of reinforced responses.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 331-338.—Measured number of responses and time to extinction of 52 adult white Carneaux pigeons after 3, 10, 1000, 3000, 5000, and 10,000 reinforced key-peck responses during conditioning. Each response was reinforced with a .045-gm food pellet. The number of responses in extinction was a monotonically increasing function which became asymptotic beyond 1000 reinforced responses. Number of reinforced responses during conditioning significantly affected the number of responses in extinction ($p < .001$) but not the time to extinction. Results support the findings of previous free-operant bar-press studies with rats. Free-operant animal studies of extinction after continuous reinforcement have consistently produced monotonically increasing functions and have typically employed relatively small amounts of reinforcement. It is suggested that amount of reward may be an important parameter determining the shape of the extinction function in the free-operant studies. (22 ref.)—*Journal abstract.*

4567. Holt, Gary L. & Scharlock, Donald P. (State University Coll. New York, Geneseo) **Correction procedures in extinction of matching behaviors.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 683-684. 3 experiments using 2 pigeons, were designed to assess correction procedure functions in acquisition and extinction of matching behavior. In Exp. I, correction procedure removal from blue and amber center-key conditions during operational extinction produced sustained chance matching. Red center-key conditions, not operational extinction, remained at high base-line values. In Exp. II, removal of incorrect red center-key correction responses slightly increased between-session variability in accuracy on red center-key conditions. In Exp. III, percent correct responses to red center-key conditions became more variable between sessions under base-line and extinction sessions following removal of correction procedure from all conditions. Blue and amber center-key accuracy decreased, maintaining near chance performance.—*Author abstract.*

4568. James, W. T. (U. Georgia) **A methodological study of conditioning and extinction of an avoidance response via social facilitation in dogs.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 275-279. 6 puppies were trained to make a conditioned escape response in a runway by responding with a decoy previously trained to run. A spray of water was used as the UCS with the decoy. 4 Ss also extinguished readily when placed with a decoy that had not been trained to escape. Conditioning and extinction of an aversive

behavior can be more readily studied in dogs by the use of water spray than by shock. (18 ref.)—*Author abstract.*

4569. Leach, David A. (Coll. of Wooster, O.) **Rats' extinction performance as a function of deprivation level during training and partial reinforcement.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 317-323.—Examined the finding of J. Theios (see PA, Vol. 38:507) that drive level during training has a relatively permanent effect on habit strength persisting in extinction. The running behavior of 48 male albino Holtzman rats trained with partial reinforcement or CRF with body weights under 70% (high deprivation) or over 90% (low) of normal was extinguished with all Ss at low deprivation. Neither training-deprivation level nor its interaction with reinforcement percentage affected the extinction performance. The partial reinforcement extinction effect resulted solely from interfering responses and reactions to nonreward included convulsive seizures in Ss with a history of malnutrition. The failure to replicate Theios' results supports the conclusion that habit strength is not a function of drive level during acquisition. (19 ref.)—*Journal abstract.*

4570. Powell, Robert W. (U. South Florida) **Some effects of punishment shock intensity upon discriminative responding.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 109-116.—3 adult White Carneaux pigeons received visual discrimination training under both multiple variable-ratio extinction and variable-interval extinction schedules. All Ss developed nearly perfect discrimination. When punishment for every 10th response during food reinforcement was presented, responding decreased as shock intensity increased. At the same time, responding during extinction, which was not punished, increased at intermediate punishment intensities, but returned to low levels under severe punishment. A 2nd procedure, in which punishment and no punishment sessions alternated unsystematically, was employed with 2 of the Ss. Results under this procedure essentially replicate the data obtained as punishment shock intensity increased gradually.—*Journal abstract.*

4571. Roberts, Carl L. & Blase, Karen. (Colorado Coll.) **Elicitation and punishment of intraspecies aggression by the same stimulus.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 193-196. Elicited fighting responses in 15 pairs of naive, male albino Sprague-Dawley rats by shocks over a 46-day period. During certain blocks of these days "punishing" shocks were made contingent on the shock-elicited fights. Fighting frequency was reduced as a direct function of the intensity of the contingent shocks. Fighting frequency recovered completely when contingent shocks were removed.—*Journal abstract.*

4572. Rollings, J. Paul & Melvin, Kenneth B. (Alabama) **Effects of a punitive noise on self-punitive running established with shock.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 313-314.—3 groups of male hooded rats ($N = 8$ group) were trained to escape electric shock by traversing a straight alley. 2 groups punished in the alley showed more resistance to extinction than did a nonpunished group. An additional punishment, noxious noise summated with shock punishment to produce and maintain faster self-punitive running.—*Journal abstract.*

4573. Russin, Raymond; Bover, William N., & Cross, Henry A. (Colorado State U.) **Extinction as a function of varied quality and quantity of reward sequence in**

a straight alley. *Psychonomic Science*, 1970(Dec), Vol. 21(5), 274-275.—4 groups of male albino Charles River rats ($N = 48$) were extinguished in a straight alley after receiving 2 daily trials on 1 of the following varied quality and/or quantity of reward sequences: (a) 1 alfalfa pellet followed by 1 sucrose pellet, (b) 1 sucrose pellet followed by 1 alfalfa pellet, (c) a single alfalfa pellet followed by 16 sucrose pellets, and (d) a single sucrose pellet followed by 16 sucrose pellets. Results indicate that a high-quality following a low-quality reward produced greater resistance to extinction than when a low-quality followed a high-quality reward. Findings are interpreted within E. J. Capaldi's sequential theory.—*Journal abstract*.

4574. Stein, Norman; Hoffman, Howard S., & Christopher, Stitt. (Syracuse U.) **Collateral behavior of the pigeon during conditioned suppression of key pecking.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 83-93.—Ethological recording procedures measured collateral behavior in 5 male homing pigeons whose key-pecking performance was suppressed during a tone that ended with unavoidable electric shock. Independent recordings of gross behavior were made by 2 Os throughout 60-sec intervals immediately before, during, and after tone presentation. Results indicate significant reductions in the frequency of collateral movements and an increase in the time between successive movements during tone presentations. These effects were observed in all Ss, despite differences in the sequential patterns of behavior. Only partial recovery of the behavior evidenced before tone presentation was found during a 60-sec interval following shock. It is concluded that conditioned suppression procedures caused the S to "freeze" during tone presentation and in this fashion produced a general inhibitory effect on ongoing overt activity, including key pecking.—*Journal abstract*.

4575. Van Houten, Ronald & Rudolph, Robert. (Dalhousie U., Halifax, Nova Scotia, Canada) **Summation of punishment suppression.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 117-121.—In 2 experiments, 8 male Sprague-Dawley albino rats were trained to lever press with food on a variable-interval (VI) schedule. Bar pressing produced shock on a VI schedule in the presence of 2 independently presented stimuli, a light and a tone. 2 Ss in each experiment received alternative presentations of the light and the tone and were consequently always in the presence of a stimulus that signaled VI punishment. The other 2 Ss in each experiment were treated similarly except that they received periods in which neither light nor tone was present. During these periods, bar pressing was not punished. The 2 stimuli that signaled punishment were then presented simultaneously to evaluate the effect of stimulus compounding on response suppression. The Ss trained without punishment-free periods did not show summation to the compound stimulus; the Ss trained with punishment-free periods showed summation of suppression. The major difference between the 2 experiments was the longer mean interval of VI punishment used in the 2nd experiment. This manipulation made the summation effect more resistant to extinction and thus increased its magnitude.—*Journal abstract*.

4576. Walters, Gary C. & Glazer, Rochelle D. (U. Toronto, Ontario, Canada) **Punishment of instinctive behavior in the Mongolian gerbil.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2),

331-340.—Using a secondary punishment procedure, 8 male gerbils received response-contingent punishment for either a sand-digging or an alert-posturing response. Compared with 8 nonpunished Ss, Ss punished for digging showed immediate and long-lasting response suppression during the entire punishment phase. Ss punished for posturing displayed an increase in the posturing response throughout punishment. A 2nd study with 5 Ss demonstrated the efficacy of the aversive conditioning procedure employed to establish a tone as a secondary punisher. It is argued that digging and posturing represent different classes of behavior which are differentially affected by punishment. Findings emphasize the importance of an understanding of the nature of the response being studied in investigations of punishment. (19 ref.)—*Journal abstract*.

SOCIAL & SEXUAL BEHAVIOR

4577. Barth, Robert H. (U. Texas) **The mating behavior of periplaneta americana (Linnaeus) and Blatta orientalis Linnaeus (Blattaria, Blattellinae), with notes on 3 additional species of Periplaneta and interspecific action of female sex pheromones.** *Zeitschrift für Tierpsychologie*, 1970(Sep), Vol. 27(6), 722-748.—In *P. americana*, a volatile female sex pheromone is important in sex recognition, attraction and release of courtship behavior. The relationship between wing-raising display of the male and motivational factors is described. Backing movements and phallomere protrusion are released by tactile stimulation of the abdominal tip, which leads to frequent unsuccessful copulation attempts with unreceptive females. Successful copulation requires active mounting on the part of a receptive female; both chemical and tactile stimuli are involved. The sex pheromones of the 3 other species appear to have a less prominent role in the release of male courtship behavior. *Blatta orientalis* lacks a volatile female sex hormone, thus, sex recognition, etc., depends on chance contacts. Female sex pheromones are effective in releasing male courting behavior within groups of closely related species, but not between these groups. During phylogenesis cockroaches may have developed several pheromones independently of each other. (36 ref.)—*Journal abstract*.

4578. Brain, Carolyn L. & Griffin, Gary A. (U. Waterloo, Ontario, Canada) **The influences of the sex of littermates on body weight and behaviour in rat pups.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 512-516.—Male and female rat weanlings were heavier when reared in the absence of littermates of the opposite sex as compared to sexually heterogeneous conditions. These differences were evident at Day 14 and persisted for several weeks after weaning. Fostering did not contribute to this finding nor were there differences in maternal behavior towards the pups. Members of homogeneous litters were more active and displayed fewer clustering responses than those of litters with both sexes.—*Journal summary*.

4579. Brian, M. V. **Communication between queens and larvae in the ant Myrmica.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 467-472.—Investigated the influence of queens on larvae growth with respect to either direct queen action on larvae or interworker transmission. Queens are ineffective if screened from workers and brood in decreasing growth of potential queen larvae and increasing growth of small ones. If

workers have access to the queen they can be induced to scar large larvae. Workers do not communicate information about the presence of queens through gauze screens.—*Journal summary.*

4580. Cherney, Edward F. & Bermant, Gordon. (U. California, Medical School, Los Angeles) **The role of stimulus female novelty in the rearousal of copulation in male laboratory rats (*Rattus norvegicus*).** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 567-574.—Long-Evans rats copulated with single females to satiation (30 min. without intromission). A "priming" female was then presented to each male for 1 intromission and removed. 30 sec. later either the original or the priming female was reintroduced and the male again allowed to copulate until satiation. Mean ejaculation frequency with the priming female was 2.8 times greater than with the reintroduced original female (1.4 vs. .41 ejaculations). In Exp. II the original female was reintroduced while the priming female was placed in a wire cage within the test arena. The visual, olfactory, and auditory presence of the priming female did not enhance ejaculatory capacity (.36 vs. .41 ejaculations in Exp. I). Data are discussed in terms of revisions of the dual-mechanisms theory of rat copulation originally proposed by Beach. (26 ref.)—*Journal summary.*

4581. Grant, P. R. (McGill U., Montreal, Quebec, Canada) **Experimental studies of competitive interaction in a two-species system: II. The behaviour of *Microtus*, *Peromyscus* and *Clethrionomys* species.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 411-426.—Tested the interaction between 4 species of microtine rodents with respect to habitat. Within the same species dominance was a function of body weight, but 2 species had a mutually dispersive effect upon each other in relation to habitat occupied. Early exposure to habitat features in young animals was an important factor. (51 ref.)—*Journal summary.*

4582. Gwinner-Hanke, Helga. (U. Vienna, Zoological Inst., Austria) **Zum Verhalten zweier stridulierender Spinnen *Steatoda bipunctata* Linné und *Teutona grossa* Koch (Theridiidae, Araneae), unter besonderer Berücksichtigung des Fortpflanzungsverhaltens.** [The behavior of two stridulating spiders (*Steatoda bipunctata* L. and *Teutona grossa* Koch, Theridiidae, Araneae), with special reference to reproductive behavior.] *Zeitschrift für Tierpsychologie*, 1970(Sep), Vol. 27(6), 649-678.—Courtship of *T. grossa* males consists of 7 partial behavior patterns: jerking runs of the female web, blows with the forelegs, trillering on the female, spinning the mating-web and pulling on it, stridulating, and attempts to copulate. Jerking and pulling are negatively correlated. They elicit jumping and the copulation posture of the female, respectively. Jerking and stridulation are elicited by chemotactile stimuli of the female web. The greater the dissociation of the courtship sequence, the greater the amount of stridulation. The female of *S. bipunctata* reacts to a stridulating male even when it remains outside the web. If the stridulation organ is covered up, *S. bipunctata* does not court, while *T. grossa* does continue in an untypical manner and is unable to copulate. Both species' stridulation organ consists of a movable abdominal part (a prominence with hairs and teeth) and a fixed thoracic part (parallel ridges). *S. bipunctata* rubs 1 tooth over about 23 ridges/stridulation movement, producing a metallic click sound of 700-1400 cycles which has to be amplified in order to be heard. *T. grossa* makes a

scraping noise. Other behavior patterns are described. (22 ref.)—*English abstract.*

4583. Haacker, Ulrich & Fuchs, Stefan. (Darmstadt Technical School, Zoological Inst., W. Germany) **Das Paarungsverhalten von *Cylindroiulus punctatus* Leach.** [The mating behavior of *Cylindroiulus punctatus* Leach.] *Zeitschrift für Tierpsychologie*, 1970(Sep), Vol. 27(6), 641-648.—The mating behavior of *Cylindroiulus punctatus* is typical for most Julidae species. Promerites and mesomerites of the male gonopods serve as tongs and pull the female's vulvae out of their pouches. The hook-shaped 1st pair of legs fixes the female's head. Mating attempts are elicited by conspecific females, less often by males, presumably by olfactory stimuli. In mating behavior only the male plays an active role: he runs up to the female's back, clinging to her by aid of his solepads. The mates face one another with their ventral sides, the female's head is fixed by the male's 1st pair of legs. The female's head is swung laterally, presumably for stimulation. The vulvae are pulled out by the male's gonopodial tongs. If the female is not ready to mate, she may withdraw the vulvae. Insertion of the opisthomerites (free from sperm) and rhythmic movements of the flagella occur, presumably to prepare sperm transfer. Sperm is taken from the erected genital papilla into the opisthomerites, which are held forward. The vulvae are pulled out again. Insertion of the sperm-laden opisthomerites and sperm transfer with no movement of the flagella.—*English abstract.*

4584. King, M. G. & Dua, J. K. (Macquarie U., North Ryde, New South Wales, Australia) **Cues eliciting social approach in male albino rats.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 258-259. Social approach between 120 male albino rats was best elicited initially by a combination of visual and olfactory cues. Later, (a) the frontal aspect of the seen-smelt stimulus became more salient for approach, and (b) olfactory cues alone elicited approach. After 20 trials over 2 days, the social approach response was extinguished. *Journal abstract.*

4585. Lagerspetz, Kirsti. (Turku U., Finland) **Aggressivt beteende hos möss.** [Aggressive behavior among mice.] *Nordisk Psykologi*, 1969, Vol. 21(1/2), 45-59.—Describes investigations aimed at the questions of heredity, learning, and relationships to sexuality. Measurement of aggressive behavior took place in a situation where 2 male mice had been in the same cage for 7 min. Factor analysis revealed an aggression factor corresponding to higher values on the 7-point scale and a nonaggressive factor. Selective breeding resulted in significant differences in aggression already in the 2nd generation with an increase until the 7th generation, i.e., a hereditary variation. Adoption of mice from the other strain did not influence the amount of aggression. A high level of aggressivity was associated with a high level of activity in the sympathetic system. Results indicate that learning can overshadow the hereditary disposition. As with sexuality, learning of aggressive behavior did not require satisfaction through rewards. Aggression functions like a need for achievement but only after arousal of the motive, this is a difference from sexuality. Frustration was not necessary for aggressive behavior but may be sensitizing. A mutual inhibition between aggression and sexuality was found but training increased both of them. Inhibition of aggression on the other side did not inhibit sexuality, maybe because fear also is a more parasympathetic reaction. P. Mylon

4586. Morrison, Bruce J., Forman, Hal; Harris, Connie, & Hogan, James. (Miami U.) **Dependence on smell of social and overpopulation effects in the white rat.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 316.—64 albino rats were obtained at 30 days of age, and $\frac{1}{2}$ of them had their olfactorial bulbs aspirated. 2 wk. later $\frac{1}{2}$ of the Ss were housed in groups of 4/cage and $\frac{1}{2}$ in groups of 16/cage. After 6 wk. all Ss were tested both individually and in groups in a counterbalanced manner in an open field where 7 indices of emotionality were recorded. Results show that smell is the dominant, if not sole, cue to group reduction of emotionality in the white rat. It is not, however, responsible for the increased emotionality found in overpopulated rats. The abnormal social behavior in overpopulated rats, however, tends to be eliminated by loss of smelling ability.—*Journal abstract*.

SENSORY PROCESSES

4587. Blough, Patricia M. (Brown U.) **The visual acuity of the pigeon for distant targets.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 57-67.—Measured the acuity of 6 pigeons (2 White Carneaux, 1 White King, and 3 homers) in an apparatus that required Ss to make visual discrimination at a distance of 28.75 in. (73 cm.) from the stimulus targets. The stimuli were black and white gratings of varying stripe width. A forced choice procedure was used, and both the method of constant stimuli and a descending series technique determined the order of stimulus presentation. Thresholds, obtained by interpolating at the 25% error point on the psychometric functions, ranged from 1.16-4' of arc. Thresholds measured in the same apparatus for 2 human Os were .79 and .82' of arc. The descending series design produced lower percent error rates at the widest stripe value, but otherwise there appeared to be no difference between psychophysical methods. Position preferences occurred in most of the Ss; differential percent error functions and differential latency functions to the 2 keys illustrate these. Retinal histology revealed shallow, centrally located foveae in the 3 pigeon breeds used. (23 ref.)—*Journal abstract*.

4588. Corballis, M. C. & Beale, I. L. (McGill U., Montreal, Quebec, Canada) **Monocular discrimination of mirror-image obliques by pigeons: Evidence for lateralized stimulus control.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 563-566.—3 pigeons were trained monocularly to peck a key when it displayed an oblique line sloping at 135° (positive stimulus) but not when it displayed the lateral mirror-image sloping at 45° (negative stimulus; S-). When tested with the untrained eye open, Ss generally favored S-, although the preference was rather small. Transfer tests with the trained eye open showed that the original discrimination was controlled primarily by cues on the side of the key towards the seeing eye and that the main cue was an up-down one.—*Journal summary*.

4589. Ginsburg, Norman & Nilsson, Virginia. (Lakehead U., Thunder Bay, Ontario, Canada) **Measuring flicker thresholds in the budgerigar.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 189-192.—Describes a method of measuring thresholds in animals, and the case of flicker fusion in the budgerigar is illustrated. After training with reinforcement for pecking at a high-frequency light (115 Hz.) and nonreinforcement for pecking at a low-frequency light (20 Hz.), Ss were given threshold trials and

reinforcement trials mixed randomly in equal number. In threshold trials (no reinforcement), the target began flashing at 115 Hz. and decreased in flash rate with each peck until the S stopped responding. During reinforcement trials, the target continued to flash at 115 Hz., and responses were reinforced on a variable-ratio schedule. Flicker thresholds obtained from 2 Ss showed a linear relation to the logarithm of intensity in accordance with the Ferry-Porter law.—*Journal abstract*.

4590. Jones, Gwennyth & Pasmak, Robert. (Catholic U. of America) **Light deprivation and visual-cliff performance in the adult cat.** *Psychonomic Science*, 1970(Dec), Vol. 21(5), 278-279.—8 adult cats were light deprived for 80 days and tested on the visual cliff. No deficit in performance was found on this measure of depth perception. Species differences and implications for explanations in terms of visual activity and critical maturation periods are discussed.—*Journal abstract*.

4591. Popper, Arthur N. (U. Hawaii) **Auditory capacities of the Mexican blind cave fish (*Astyanax jordani*) and its eyed ancestor (*Astyanax mexicanus*).** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 552-562.—Using avoidance conditioning mean pressure thresholds of -41.5 db. (re 1 μ b) for the river fish and -48.2 db. for the blind cave fish were found to be both a minimum at 1000 Hz. There is no evidence that the blind cave fish can detect pressure levels any better or worse than its ancestral eyed relative. Although not enough ostariophysines have yet been investigated, data substantiate earlier findings that they can hear a wider range of sounds and lower intensities than nonostariophysines. There is no obvious selective advantage for maintaining a side auditory range upon entry into the cave since no sounds above 1000 Hz. are present there. During initial training and testing the river fish had difficulty responding appropriately at 200 Hz. and between 2500-3000 Hz. possibly because the visually oriented species had learned to respond to some nonauditory stimulus aspect. (37 ref.)—*Journal summary*.

4592. Wright, Anthony A. & Cumming, William W. (Columbia U.) **Color-naming functions for the pigeon.** *Journal of the Experimental Analysis of Behavior*, 1971(Jan), Vol. 15(1), 7-17.—Trained 6 experimentally naive White Carneaux pigeons to match wavelengths in a 3-key matching-to-sample paradigm. Test trials were occasionally presented, where probe wavelengths appeared on the center key and choices were made to the training stimuli presented on the side keys. Color naming functions were obtained by plotting the percentage of test trials that each training stimulus wavelength was chosen for each center key probe wavelength. The wavelength where the functions intersected was interpreted as a transition point between pigeon hues. 3 experiments employed different wavelengths as training stimuli. Exp. I and II demonstrated that the intersection of the color-naming functions occurred in all cases at 540 and 595 nanometers (nm.). Exp. III employed 540 and 595 nm. as 2 of the 3 training stimuli, and the relatively slow acquisition, together with the resulting color-naming functions, supported the proposition that 540 and 595 nm. may be transition point wavelengths between pigeon hues.—*Journal abstract*.

DEVELOPMENTAL PSYCHOLOGY

4593. Blount, H. Parker & Johnson, Ronald E. (Purdue U.) **Syntactic influences in the recall of**

sentences in prose. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 529-530.—Attempted to determine whether complex sentences embedded within meaningful paragraphs are recalled better if (a) the sentences are constructed in the active or the passive voice, and (b) the described events within the sentences are presented in the same sequence as their correct temporal order. White 6th graders were Ss in Exp. I, and undergraduates were Ss in Exp. II. Contrary to previous results, active and passive sentences were recalled equally well. The similarity in recall apparently resulted from the use of meaningful paragraphs as context for the critical sentences. Complex sentences were recalled significantly better when the events within a sentence came in the same sequence as their temporal order.—*Author abstract.*

4594. Flax, Nathan. (Optometric Center of New York, N.Y.) **Problems in relating visual function to reading disorder.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(May), Vol. 47(5), 366-372.—Discusses the fact that inappropriate structuring of the problem of relating visual function and reading disability may obscure their actual relationship. The visual requirements for successful reading vary as a function of reading itself. Oversimplification of both vision and reading, and failure to consider the role of adaptive changes, contribute to the lack of emergence of clear research findings. Utilization of group data tends to mask specific relationships. (16 ref.)—*Journal abstract.*

4595. Hoemann, Harry W. & Ross, Bruce M. (Bowling Green State U.) **Children's understanding of probability concepts.** *Child Development*, 1971(Mar), Vol. 42(1), 221-236.—Reports 4 experiments administering probability judgment tasks using children ranging from preschool to early adolescence. Exp. I showed equivalent results with probability and proportionality instructions when judgments were performed between 2 circles with different black and white proportions. Exp. II showed that fewer correct probability than proportionality judgments occurred when Ss judged a single circle. It is concluded that the 2-circle task does not require probability concepts, since Ss need not construct probability ratios to succeed. Results confirm those of Piaget and Inhelder. Exp. III and IV modified the 2-circle task to require use of probability concepts and administered a probability task with double arrays of discrete objects. Results are comparable to those found for the single-circle task. Researchers who have claimed that preschoolchildren use probability concepts are criticized since their experimental tasks have been similar to the unmodified 2-circle task of Exp. I.—*Journal abstract.*

4596. Lacazu Gonzales, Enrique. **La actividad como factor fundamental de la educación infantil y adolescente.** [Activity as a fundamental factor in infantile and adolescent education.] *Revista del Instituto de la Juventud*, 1970(Aug), Vol. 30, 55-71.—Examines the importance of activity in the physical, mental, and emotional development of the child and adolescent, and discusses the role of the educator in fostering this activity. It is suggested that 1 of the fundamental considerations in creating activities is their precise adjustment to the age and true interests of an individual. To fail in this regard means rendering the activity worthless and causing problems for the child. It is proposed that (a) every activity occur within an environment that is conducive to the child or adolescent; (b) the child be able to choose his own activities without

outside pressure from either parent or educator; (c) the educator at all times show competence and sensitivity in advising and helping the child in his activities, so that dialogue, understanding and guidance can be maintained. (25 ref.)—*S. Maze.*

4597. Lerner, Richard M., Pendorf, James, & Emery, Anne. (Eastern Michigan U.) **Attitudes of adolescents and adults toward contemporary issues.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 139-145.—93 adolescents (mean age = 16.1 yr.) and 91 adults (mean age = 44.1 yr.) completed a 29-item questionnaire containing items pertaining to contemporary issues, e.g., drug use, police and military authority and power, sexual behavior, and religion. Significant attitudinal differences between the generations obtained on 89.5% of the items. Insofar as attitudes toward these contemporary issues are concerned, it is concluded that evidence for a generation gap was found with this sample. Results are compared with those of other studies which have investigated political-social attitudes.—*Journal abstract.*

4598. Matheny, Adam P. & Brown, Anne M. (U. Louisville, Medical School) **The behavior of twins: Effects of birth weight and birth sequence.** *Child Development*, 1971(Mar), Vol. 42(1), 251-257.—Compared behavioral differences between 32 sets of twins with minimal birth-weight differences (.25 lb. or less) with those between 15 sets of twins with maximal birth-weight differences (1.5 lb. or more). Behavioral differences were reported by mothers of the twins enrolled in a longitudinal study. In the maximal difference group, 10 of 18 behavioral variables were significantly related to birth weight, but, in the minimal group, only 2 of the 18 variables were significantly related to birth weight. The lighter Ss in the maximal difference group tended to exhibit more "problem" behaviors, and they were relatively less proficient on aspects of cognitive behaviors. Birth sequence was not found to be related to birth weight, nor did it contribute significantly to behavioral differences. The lighter Ss of the maximal difference group were comprised of small-for-term premature, whereas the lighter Ss of the minimal difference group were comprised of premature by both length of pregnancy and birth weight. Since disparities between birth weight and gestational age were related to the magnitude of differences in twins' behavior, birth weight and the length of pregnancy are important factors in studies of child behavior.—*Journal abstract.*

4599. Morehead, Donald M. (Stanford U., Medical School, Palo Alto, Calif.) **Processing of phonological sequences by young children and adults.** *Child Development*, 1971(Mar), Vol. 42(1), 279-289. Observed input-output correspondences in 3 groups of young children (mean ages of 4.2, 5.4, and 7 yr.) and adults (mean age of 20 yr.) while imitating phoneme sequences that systematically violate the sequencing rules of English. The 3 younger groups produced more phonetic and semantic interpretations of the phoneme sequences than did the adults. All 4 age groups (with 12 Ss in each group) consistently followed the rules of English when changes were made in the original phoneme sequence. As a result, few inadmissible changes occurred. Basic findings indicate that children are guided by the similar linguistic constraints as adults but are more flexible in processing new or odd phoneme sequences. Also, the children tended to "filter" linguistic input through their own internalized linguistic systems, while the adults relied more on perceptual-motor processing. It is

concluded that children seek form and meaning within the constraints imposed by the language more actively than do adults when imitating phoneme sequences that violate the sequencing rules of English.—*Journal abstract.*

4600. Poresky, Robert H. (Cornell U.) **Noncontingency detection in children and adults.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 691-692.—Adults and children demonstrated their ability to detect and react appropriately to noncontingent reinforcement. Adults showed a higher detection rate than children. The behavioral parameters of response distribution, pause time, and last response time clearly discriminated between Ss who reported noncontingency detection and those who did not. Noncontingent reinforcement was a more efficacious extinction technique than classical extinction.—*Author abstract.*

4601. Reynolds, Richard J., Bickley, A. C., Champion, Sharon, & Dekle, Ocie. (U. Georgia) **Effects of mode of presentation of stimulus materials in word-association tasks.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 211-215.—Compared differences in paradigmatic response to oral and visual presentation of word-association tasks for 40 educationally deprived Ss at 4 age levels. The syntagmatic/paradigmatic shift was investigated as a function of mode of stimulus presentation. Younger Ss produced more paradigmatic responses than older Ss. The oral mode produced more paradigmatic responses than the visual mode for all Ss. The syntagmatic/paradigmatic shift did not occur, nor was the variation across age groups consistent for the 2 modalities. Evidence indicates that response to word-association tasks was a function of stimulus modality.—*Journal abstract.*

4602. Straub, Mary F. **Self-stimulation in utero.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 55-63.—Proposes that the human fetus, in utero and often of itself, experiences the physiological effects of passion. Devoid of the sensuality denoted by common psychological reference, this embryonic emotion predisposes the fetus for some distinctly human qualities. (24 ref.)—*Journal abstract.*

4603. Traxler, Anthony. (Southern Illinois U., Edwardsville) **Age differences in interference effects in R-S recall as a function of transfer paradigm.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 607-608.—Studied the role of interference as an age-related variable in response-stimulus (R-S) recall performance by contrasting the R-S recall of a select population of young ($n = 60$ male graduate students) and old ($n = 60$ retired university professors) Ss in a paired-associate learning situation under 3 transfer conditions varying in associative interference effects (A-B, C-B; A-B, A-C; and A-B, C-D). An Age \times Paradigm interaction in R-S recall was predicted, with the old Ss showing poorer recall under the A-B, C-B paradigm due to the A-B, A-C interference relationship R-S associations form in this paradigm. Results indicate that both age and interference affected R-S recall and that the Age \times Paradigm interaction was due to the better performance of the young Ss on the A-B, C-D control paradigm, instead of the predicted poorer performance of the old Ss in the A-B, C-B condition. It is concluded that adult age differences in "interference proneness" may or may not appear depending on whether the source of interference

is due to "forward" S-R or "backward" R-S associations.—*Author abstract.*

INFANCY

4604. Barkóczi, Ilona. (Eötvös Lóránd U., Budapest, Hungary) **A kognitív motiváció néhány problémája az élet korai szakaszában.** [Some problems of cognitive motivation in the early periods of life.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 199-205.—Presents a review of the literature on the curiosity drive and the orientation reflex as applied to the cognitive development of infants. (34 ref.)—*M. Moore.*

4605. Barten, Sybil; Birns, Beverly, & Ronch, Judah. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Individual differences in the visual pursuit behavior of neonates.** *Child Development*, 1971(Mar), Vol. 42(1), 313-319.—Determined whether stable individual differences in amount of visual pursuit exist at birth. 2-day-old babies presented with 2 moving stimuli and retested 24 hr. later showed high day-to-day correlations in amount of oculocephalic pursuit of both stimuli and also in ocular pursuit of the stronger stimulus. These 2 responses seemed to be on a single dimension.—*Journal abstract.*

4606. Bell, Richard Q. & Haaf, Robert A. (National Inst. of Health, Child Research Branch, Bethesda, Md.) **Irrelevance of newborn waking states to some motor and appetitive responses.** *Child Development*, 1971(Mar), Vol. 42(1), 69-77.—During each of 2 different interfeeding periods, 6 states, ranging from low wakefulness to agitated crying, were assessed in 63 newborns between the 3rd and 4th days postpartum before a test of motor response and again before tests of nonnutritive sucking and of reaction to nipple removal. Scores for each of 6 logically different orders of these states, including 1 order which follows common usage, were related to subsequently elicited behaviors. Only 1 of the elicited behaviors showed a significant correlation with any of the orders, and this correlation was low. The findings set some limits on the general importance attached to states as predictors of response in young infants. (17 ref.)—*Journal abstract.*

4607. Brackbill, Yvonne. (U. Denver) **Cumulative effects of continuous stimulation on arousal level in infants.** *Child Development*, 1971(Mar), Vol. 42(1), 17-26.—Questioned whether level of arousal decreases as an inverse function of the number of sensory modalities continuously stimulated. 24 1-mo-old infants served as Ss under 5 different conditions: no extra stimulation (control condition) and continuous stimulation of 1, 2, 3, and 4 sensory modalities. The 4 types of stimulation were auditory, visual, proprioceptive-tactile (swaddling), and temperature. Indices of arousal level included state, heart rate, respiration regularity, and gross motor activity. Results reaffirm the pacifying effect of continuous stimulation, indicate that the effect is not restricted to 1 sensory modality but is a general characteristic of sensory stimulation in early development, and demonstrate that the pacification effect is indeed cumulative across modalities. Theoretical and practical aspects of these are discussed.—*Journal abstract.*

4608. Jackson, Jan C., Kantowitz, Susan R., & Graham, Frances K. (U. Wisconsin) **Can newborns show cardiac orienting?** *Child Development*, 1971(Mar), Vol. 42(1), 107-121.—Typically, newborn

heart rate (HR) accelerates in response to brief sensory stimuli while the HR response of older infants and adults is primarily decelerative. Since HR acceleration has been associated with a protective-energizing system that may inhibit stimulus processing and HR deceleration has been associated with an orienting and facilitating system, a developmental change in HR response has behavioral significance. However, the evidence of a developmental change is unsatisfactory on at least 2 grounds, i.e., newborns have generally been studied in drowsy states and with stimuli that may evoke a startle reflex. 3 experiments were conducted to remove these grounds for objection. Stimuli were pure tones of low to moderate intensity whose rise time was controlled. In a group of 24 newborns whose state was not monitored, HR acceleration still occurred, but the relatively prolonged latencies suggested that startle effects had been removed. In 2 groups of 12 awake newborns each, there was no clear acceleration and no convincing evidence of deceleration. It appears difficult to elicit the cardiac component of orienting from newborns even when conditions parallel those used with older infants. (23 ref.)—*Journal abstract.*

4609. Meierhofer, Marie. ("Zum Holderbach," Oberägeri, Switzerland) *Entwicklungskrisen und Konflikt-situationen im Säuglings- und Kleinkindalter.* [Development crises and conflict situations in infants and toddlers.] *Praxis der Psychotherapie*, 1969(Dec), Vol. 14(6), 266-274.—Traditional practices based on concepts of hygiene, pediatrics, and psychoanalysis, which introduce isolation and discipline into infantile experience as a means of accelerating development, are overlooking evidence concerning the nature, needs, and dangers inherent in the earliest months and years of life. Infants cry for the mother, rather than for food. A longitudinal study of 400 infants at the Institut für Psychohygiene im Kindesalter in Zurich, Switzerland, showed that mechanized care does not provide the infant with the necessary supportive and stimulating human contacts. Lack of human contact produces acute and chronic desolation syndromes with severe psychomotor excitability. Motor, social, and speech development are retarded. Children with introverted tendencies and cerebral lesions experience the greatest harm. Early frustration and feelings of desolation have longlasting impact on personality development. While psychotherapy may rectify the situation, the real solution involves prophylaxis thorough counseling and organized social work.—*B. Stanton.*

4610. Ramey, Craig T. & Ourth, L. Lynn. (Wayne State U.) *Delayed reinforcement and vocalization rates of infants.* *Child Development*, 1971(Mar), Vol. 42(1), 291-297.—15 normal, home-reared infants at each of 3 age levels (3, 6, or 9 mo.) were submitted to operant conditioning procedures designed to increase the rate of vocalization behavior. $\frac{1}{3}$ of the Ss received immediate reinforcement, $\frac{1}{3}$ received a 3-sec delay between response and reinforcement, and $\frac{1}{3}$ received a 6-sec delay of reinforcement. Results indicate that learning occurred only under immediate reinforcement and that there was no developmental trend in the ability to withstand the detrimental effects of delayed reinforcement.—*Journal abstract.*

4611. Rebelsky, Freda & Hanks, Cheryl. (Boston U.) *Fathers' verbal interaction with infants in the first three months of life.* *Child Development*, 1971(Mar), Vol. 42(1), 63-68.—Fathers' verbal interactions with

their infants were gathered by means of a microphone attached to the infant for a 24-hr period every 2 wk., from the time the infant was 2 wk. of age to the time he was 3 mo. old. Ss were 7 male and 3 female infants and their fathers. Data show that fathers spend little time vocalizing to their infants and that the number of interactions varies by time of day, age and sex of infant, and the kind of activity occurring during the interaction.—*Journal abstract.*

4612. Schmidt, Katalin & Birns, Beverly. (Albert Einstein Coll. of Medicine, Yeshiva U.) *The behavioral arousal threshold in infant sleep as a function of time and sleep state.* *Child Development*, 1971(Mar), Vol. 42(1), 269-277.—In a group of 14 2-5 day old infants the behavioral arousal threshold (BAT) for a cold thermal stimulus was found to be significantly higher in the 2nd quiet sleep epoch than in the 1st. This finding points to the importance of the time effect concerning the BAT in infant sleep. The BAT in quiet vs. active sleep was not significantly different for the same stimulus. The role of different modalities of stimulation and individual differences as determinants of responsiveness during neonatal sleep states is discussed. (20 ref.)—*Journal abstract.*

4613. Serafica, Felicissima C. & Uzgirls, Ina C. (Clark U.) *Infant-mother relationship and object concept.* *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 141-142.—Investigated the relationship between development of the infant-mother relationship and object concept development. 19 male and 17 female 4-12 mo. old infants were Ss. Infant-mother relationship was defined within the broader context of the construct "interpersonal relationship." Development of the infant-mother relationship was hypothesized as a progression from a state of relative undifferentiatedness to increasing differentiation and hierarchic integration among 4 hypothesized components of an interpersonal relationship, namely, discrimination, affect, approach, and expectancy. Findings are interpreted as indicating a reciprocal relationship between development of the infant-mother relationship and object concept development. Discussion focuses on the changing interaction between object concept and specific components of the infant-mother relationship.—*Author abstract.*

4614. Tardos, Anna; Dragosinova, Raisza, & Mityeva, Júlia. *Különböző feltételek mellett nevelt 3-12 hónapos csecsemők optikus és taktil-motoros explorációs viselkedése.* [Optical and tactile-motor explorational behavior of infants between 3 12 months reared under different circumstances.] *Psichologiai Tanulmányok*, 1968, No. 11, 287-298. Reports parallel investigations on children who were reared under different conditions in 2 institutions. Observation was focused on the time period infants spent on optical- and tactile-motor explorational behavior, and on the attention processes in course of these operations. Infants were subjected to longitudinal observation in a well-defined setting. (Russian summary) *English summary.*

CHILDHOOD

4615. Árochová, Ol'ga; Jelenková, Alena; Dornič, Stanislav, & Halmiová, Ol'ga. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) *Search time, recall and recognition in 4-5 year old children.* *Studia Psychologica*, 1970,

Vol. 12(4), 303-305.—Investigated the developmental aspects of searching behavior. Ss were 20 4-5 yr. old kindergartners (15 boys and 5 girls). The effect of color in the search matrix, recall, and recognition of the searched targets was followed. In addition, the effect of short-term memory loading on the searching activity at this age level was investigated. It was found that short-term memory loading can not be successfully investigated in Ss of this age. Only 11 Ss completed the experiment since the others had search times greater than 2 min. (Czech & Russian summaries)—*Journal abstract*.

4616. Balthes, P. B., Balthes, Margaret M., & Reinert, G. (West Virginia U.) **The relationship between time of measurement and age in cognitive development of children: An application of cross-sectional sequences.** *Human Development*, 1970, Vol. 13(4), 258-268.—Administered 4 measures of cognitive functioning (induction, verbal comprehension, number, perceptual speed) from the Begabungstestsystem to 315 male, and 315 female children obtained by random sampling from 48 elementary schools using cross-sectional sequences as data collection strategy. 3 cross-sections separated by 4-mo intervals were conducted to test for the effects of age, time of measurement, and sex. Age was varied in 3 levels (8, 9, 10), and time of measurement in 3 levels (November 1964, March 1965, July 1965). Analysis of variance resulted in significant main effects of age and time of measurement for all measures. Time of measurement differences are interpreted as representing differential amounts of schooling rather than season of birth effects and appear to concern primarily crystallized intelligence measures. Results are in close agreement with a previous study and further support the need for applying sequential strategies in age-developmental research. (20 ref.)—*Journal abstract*.

4617. Connell, R. W. (U. Chicago, Center for Social Organization Studies) **Class consciousness in childhood.** *Australian & New Zealand Journal of Sociology*, 1970(Oct), Vol. 6(2), 87-99.—Presents an account of the development of class consciousness among a sample of 91 Sydney, Australia, 5-16 yr. old schoolchildren. 3 stages could be identified. A marked age change in the belief that differences in wealth are fair is related to the development of class schemes and the pervasiveness of the gospel of work among adolescents. 2 pockets of heightened class consciousness are identified, but most of the Ss had little conception of, and no strong feelings about, their own class positions. These facts are related to the relative insulation of the children from the workings of the industrial system.—*Journal summary*.

4618. Garvey, Catherine & Baldwin, Thelma. **Studies in convergent communication: III. Comparisons of child and adult performance.** *Center for the Study of Social Organization of Schools Report*, Johns Hopkins U., 1971(Feb), No. 94, 43 p.—Compared the communications of 47 (5th grade) child dyads and 24 adult dyads, which were observed during the performance of 3 convergent communication tasks, on various features of communication structure and content. Compared to child dyads, adult dyads more consistently marked the organization of the communication and included more evidence of verbal cooperation and reclarification of encoded messages. Children's communications showed more variability in the inclusion of the identified structural features than did adult dyads. No differences in these features were observed in the communication of children from different socioeconomic status, race, and sex subgroups.—*Journal abstract*.

4619. Geréb, György. **Intenzív tevékenység és monoton állapot kölcsönhatásának vizsgálata általános iskolai tanulókánál.** [Examinations of the interaction between intensive activity and monotonous states in primary school pupils.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 249-266.—Examines the interaction between intensive activity and monotonous states by (a) having Ss practice simple activities to the point of monotony; (b) performing tremometric measurements; (c) administering the children's series of the Dükér-Lienert KLY before and after monotonous activity; (d) asking Ss to remember a table that had been perfected tachistoscopically; (e) testing acoustic memory; (f) performing tapping tests; and (g) collecting Ss' subjective experiences through a questionnaire. It was found that activity involving intensive concentration of attention has a favorable effect on the level of monotonous activity, i.e., by increasing attention energy. The monotonous situation is considered to be a state involving a specific energetic level, the regularities of which can be studied only in association with the preceding and succeeding forms of activity. Boring activity results in a state of saturation, which in turn elicits impulsive, nervous, oppositional, hyperactive forms of response in the pupils. (Russian summary) (44 ref.)—*English summary*.

4620. Gitter, A. George; Satow, Y., & White, A. (Boston U.) **Racial misidentification skin color and physiognomy.** *CRC Report*, Boston U., 1968(Dec), No. 33, 24 p.—Examined the effects of race, sex, and age of 80 4-6 yr. old Negro and white children on racial misidentification. Both skin color and physiognomy of stimuli (9 male and 9 female dolls) were varied. Race and sex effects were significant for both color and physiognomic misidentification. *Journal abstract*.

4621. Golden, Mark; Birns, Beverly; Bridger, Wagner, & Moss, Abigail. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Social-class differentiation in cognitive development among black preschool children.** *Child Development*, 1971(Mar), Vol. 42(1), 37-45. Reports a longitudinal study of 89 Negro children from different social classes. While there were no significant SLS differences on the Cattell Infant Intelligence Scale at 18 and 24 mo. of age, there was a highly significant 23-point mean IQ difference on the Stanford Binet at 3 yr. of age between Ss from welfare and middle-class Negro families. The range in mean IQs of the Negro Ss in the extreme SES groups (93-116) was almost identical to that obtained by L. M. Terman and M. A. Merrill in their standardization sample of 831 white children between 2½ and 5 yr. of age.—*Journal abstract*.

4622. Gough, I. R., et al. (U. Queensland, Brisbane, Australia) **Aspirations of aboriginal children.** *Australian Psychologist*, 1970(Nov), Vol. 5(3), 267-269. Reports on a project which attempted to assess what aboriginal children thought the future held for them. 126 5-11th graders were interviewed with 4 questions pertaining to future involvement. Results indicate that: (a) girls aspired to higher occupational levels than boys, (b) the children were interpreted to have limited ambitions, (c) both boys and girls aspired to higher occupational status than their fathers, and (d) 53% of the wishes were for material possessions.—*H. Roemmich*.

4623. Goulet, L. R. (U. Illinois) **Training, transfer, and the development of complex behavior.** *Human Development*, 1970, Vol. 13(4), 213-240. Current research concerned with the role of experience in development is directed to assessing the effects of training on

child behavior. This approach is discussed as a general strategy for experimental research in the study of developmental phenomena, and for its implications in contrasting models of development in terms of their assumptions relating to the joint roles of experience and maturation in behavior. The similarities of these assumptions to those made in learning theories are also discussed. Experimental methods for the systematic assessment of training-related changes in behavior are presented as procedures for studying phenomena which typically covary with age in the natural environment. (47 ref.)—*Journal abstract.*

4624. Grosvenor, Theodore. (U. Waterloo, School of Optometry, Ontario, Canada) **Refractive state, intelligence test scores, and academic ability.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(May), Vol. 47(5), 355-361.—In an experiment with 707 intermediate school European and Maori children, it was found that myopes had higher mean scores than hypermetropes on both the Otis Self-Administered Test and the Raven Progressive Matrices test. Myopes also occurred in significantly greater numbers in high ability than in low ability classrooms. Results are discussed in terms of 4 hypotheses, previously suggested by M. J. Hirsch in his experiment with 554 school children given the CTMM: (a) myopia is an overdevelopment of the eye just as hypermetropia is an underdevelopment; (b) intelligence test scores may be influenced by the amount of reading a child does; (c) the more intelligent child may read more and thus become more myopic; and (d) in taking the test, a premium is placed upon the ability to perceive fine detail efficiently, thus giving the myope an advantage.—*Journal abstract.*

4626. Ireton, Harold R. & Thwing, Edward J. (U. Minnesota) **The Child Development Inventory: For the description of the development of preschool children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 453-454.—The Child Development Inventory (CDI) was devised for purposes of clinical evaluation, mass screening, developmental research, and parent education. The CDI consists of 320 statements describing the behaviors of children in the 1st 6 yr. of life. The inventory is completed by the child's mother who endorses those statements which describe the child's behavior. Results are represented in a profile of 8 developmental scales: Gross Motor, Fine Motor, Situation Comprehension, Expressive Language, Verbal Comprehension and Conceptualization, Self-Care, Personal-Social, and General Development.—*Author abstract*

4627. Jung, John. (California State Coll., Long Beach) **Modeling effects in children on a successive word association test.** *Canadian Journal of Psychology*, 1970(Dec), Vol. 24(6), 381-388. 27 8th graders received a word association test involving successive tests on the same list with no instruction as to whether the responses to each given stimulus should be the same or different on successive tests. Wide individual differences were obtained in the level of consistency of responses. In a 2nd study, pairs of Ss were formed which consisted of 1 high and 1 low consistency S, as determined by a pretest. 127 7th and 8th graders were Ss. Each S was tested with a different list in the pair-wise situation, with 1 member observing the performance of the other before being

tested himself. Significant matching occurred within pairs in Group H-L where a high consistency model preceded a low consistency O. Nonsignificant changes in the expected direction occurred for high consistency Os who followed low consistency models in Group L-H. The possibility that the pretest may have anchored the performance of the Os against the influence of the models was discussed. (French summary) *Journal abstract.*

4628. Lassó, Károly & Hoffmann, Lajos. **A gyermekkorúak életkori sajátosságainak jelentősége a kihallgatás taktikájában.** [The bearing of age characteristics on the tactics of interrogating juveniles.] *Pszichológiai Tanulmányok*, 1968, No. 11, 607-621.—Comparing the evidence of 5-6 yr. old children with that of adults who suffer from some sensory defect, the evidence of the children was found to be more reliable. Manifestations of age characteristics are analyzed in the development of the evidence and in their bearing on evaluation. The importance of choosing proper surroundings for the interrogation is stressed. Experience has shown that interrogations conducted in the presence of parents or others are likely to lead to distortions. Methods aimed at revealing indoctrination for fixing false evidence and at facilitating memory processes in children are treated. Tactics of interrogation should be based on the study of problems associated with attention and speech. (Russian summary) (25 ref.)—*English summary.*

4629. McGhee, Paul E. (U. Toronto, Ontario, Canada) **Cognitive development and children's comprehension of humor.** *Child Development*, 1971(Mar), Vol. 42(1), 123-138. Investigated the relationship between children's level of cognitive functioning (according to Piaget's theoretical framework) and their comprehension and appreciation of humor based on violation of cognitive expectancies. A distinction was drawn between novelty and incongruity humor differing in the nature of expectancy violation represented. The general hypothesis tested was that operational thinking is necessary for comprehension of incongruity humor but is not necessary for comprehension of novelty humor. Ss were 30 5-, 7-, and 9-yr-old boys. The above hypothesis was confirmed only for the 7-yr-old group. Also, for the incongruity humor (but not novelty humor) operational thinking was found to be an important factor in the ability to give interpretive, as opposed to descriptive explanations. Level of cognitive development was not significantly related to humor appreciation for either novelty or incongruity humor. Analyses of age differences indicate consistent significant increases in comprehension with increasing age for all humor stimuli. Similar analyses for humor appreciation yielded no significant age differences. (17 ref.)—*Journal abstract.*

4630. Nagy, György. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **8-15 éves leányok és fiúk sportágválasztási indokai kérdőíves felmérés alapján.** [Motives of girls and boys between 8 and 15 for choosing a particular branch of sport, assessed by means of questionnaires.] *Pszichológiai Tanulmányok*, 1968, No. 11, 431-440.—Reports a survey conducted on 1310 children. Motives were classified according to the eliciting agent into external and internal motives, and then related to the age of the Ss. It was found that from age 13 Ss tend to make their choice on the basis of internal motives and that they hang on to their choice only if their achievements are rewarded both in the training period and in contests. Results may serve

as a basis for a more detailed motivational analysis of sport activities. (Russian summary)—*English summary*.

4631. Nagy, László. (Central Library of Education, Budapest, Hungary) **A fejlődéslelektan kutatásának néhány módszertani problémája.** [Methodological problems of child psychological research.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 179-184.—Since systematic training and instruction are the main factors of child development, the methods of child psychology must include the developmental process. An active method of influencing the development of an S (e.g., the school laboratory established by D. B. Elkonyin) is contrasted with the traditional passive one of describing the course of development. Problems of the longitudinal study method are also considered because analysis refers only to a cross-section, and only to various phases of development, so the whole period of development and that of the longitudinal examination do not coincide. The resulting description of mental development is much too general and abstract. It could be made more concrete by introducing "typical courses of development" or developmental models. (Russian summary)—*English summary*.

4632. Osborn, D. K. & Endsley, R. C. (U. Georgia) **Emotional reactions of young children to TV violence.** *Child Development*, 1971(Mar), Vol. 42(1), 321-331.—Using a procedure for recording continuously the amount of emotional sweating (GSR), 4- and 5-yr-old children were shown 4 brief TV film episodes. 2 films, 1 employing cartoon characters (CV) and the other human characters (HV), contained violent actions among the characters. 2 other films contained only nonviolent (N) actions among the characters (NCV and NHV). As measured by their GSR, Ss responded more emotionally to CV and HV, particularly the latter, than they did to the nonviolent films. Ss also subsequently selected HV as the "scariest" film, and recalled more detail from HV 1 wk. later than from the other 3 films. Finally, Ss most frequently selected the 2 cartoon films, particularly NCV, as the "best liked" films. (15 ref.)—*Journal abstract*.

4633. Péterffyné-Mirtse, Márta. (Medical U. Budapest, Children's Clinic, Hungary) **Balkezes gyermekek elemi konstruáló tevékenységének vizsgálata.** [Examination of the elementary constructing activity in left-handed children.] *Pszichológiai Tanulmányok*, 1968, No. 11, 317-331.—Reports experiments with 15 reeducated and 10 manifest left-handed 8.6-11.3 yr. old children. Using the method designed by J. Salamon, the study aimed at revealing thought process traits manifested by Ss while performing the constructing tasks according to model. Results, which were quantified in terms of period of orientation activity, number of operations required for assembling, solution of mental tasks, and level of task solution, did not show any important differences between the 2 groups. Difference in hand preference, however, made it possible to analyze specific manifestations of handedness in the course of particular operations. Reeducation of left-handed children did not seem to significantly influence their constructing ability and thought processes. However, in order to generalize, examination of left-handed children would have to be conducted on a larger scale. (Russian summary)—*English summary*.

4634. Popper, Péter. (Medical U., Children's Clinic, Budapest, Hungary) **A klinikai gyermekpszichológia alapvető kutatómódszertani problémáiról.** [Fundamental methodological problems of clinical research

in child psychology.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 371-378.—Denies the existence of antagonism between clinical practice and experimental method and by showing that the 2 are inseparable, tries to effect their synthesis. A brief survey of the cardinal methodological postulates of clinical psychology, mainly in relation to psychodiagnostics and psychotherapy are presented. These postulates are: (a) complexity of methods employed; (b) necessity to interpret results; (c) historical relations of research method; (d) employment of indirect projective research methods and tests; and (e) necessity of attending to the family as a group. Particular stress is laid on studying the connections between symptom and diagnosis, a systematic treatment of the following points being advised: (a) complaint, (b) symptom, (c) the problem as it presents itself to the S, (d) the problem as it presents itself to the environment, and (e) the problem as it presents itself to the psychologist. The personality of the psychologist has to be taken into account, especially in respect of his emotional equilibrium. This postulate is considered to be of basic importance and must be considered in the training of psychologists. (Russian summary)—*English summary*.

4635. Rossi, Sheila & Wittrock, M. C. (U. California, Los Angeles) **Developmental shifts in verbal recall between mental age two and five.** *Child Development*, 1971(Mar), Vol. 42(1), 333-338.—Investigated a developmental progression in children's bases for organizing words in free recall. The hypothesized developmental progression began with rhyming responses peaking at MA 2, followed by syntactical, clustering, and serial ordering responses reaching their peaks at MA 3, 4, and 5, respectively. 2 stimulus lists of 12 words each were presented individually to 144 children rated as having low, average, or high IQs. It was found as hypothesized that in free recall: (a) rhyming reached its peak proportion at MA 2; (b) syntactical responses reached their highest proportion at MA 3; (c) clustering reached its peak proportion at MA 4; (d) serial ordering reached its peak at MA 5; (e) clustering showed a positive linear trend with intelligence; (f) intrusions showed a negative linear trend with intelligence; and (g) the most frequent responses at a given age were rhyming at MA 2, clustering at MA 3 and 4, and serial ordering at MA 5.—*Journal abstract*.

4636. Rowland, G. Thomas & McGuire, J. Carson. (New York U.) **The mind of man: Some views and a theory of cognitive development.** Englewood Cliffs, N.J.: Prentice-Hall, 1971. xix, 167 p. \$5.95.

4637. Sylvester, John D. (Inner London Education Authority, England) **Confidence and set in learning and perception.** *Studia Psychologica*, 1970, Vol. 12(4), 306-313.—Postulated that confidence is a definite psychological factor, with a clear physiological and neurological basis, i.e., that it appreciably affects performance of both mental and physical skills directly (as a causative factor), and that it can be increased or decreased by various methods classifiable under the term suggestion. 3 experiments are described. The 1st consisted of giving 8-14 yr. old children an intelligence test and an attainment test, and then deriving a measure of "confidence-level." It was found that the confidence-level score accounted for more than 58% of the discrepancy between innate ability and actual performance. The other 2 experiments (with 46 undergraduates and a class of school children, respectively) dealt with the manipulation of confidence and show how discouragement considerably impairs both perception

and learning. (Czech & Russian summaries)—*Journal abstract*.

4638. Young, Frances A., et al. (Washington State U., Primate Research Center) **Refractive errors, reading performance, and school achievement among Eskimo children.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(May), Vol. 47(5), 384-390.—Presents the relationship between refractive errors and various measures of reading and school achievement on 204 3rd-6th grade Eskimo students at Barrow, Alaska. Comparisons were made with the Caucasian population of school children at Pullman, Washington, using the Betts II Level Reading Test and the California Achievement Test as measures. Results show the same relationships in both groups between reading performance, achievement test performance, and refractive error. The more myopic Ss tended to score higher on reading and achievement tests.—*Journal abstract*.

Learning

4639. Bucher, Bradley & Anthony, Julie. (U. Western Ontario, London, Canada) **Effects of different reinforcement patterns on the inhibitory properties of S-** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 685-686.—Current conceptualizations of inhibition imply that S- function after training is affected by the consequences of S- responding. Studies of the inhibitory functions of S- after errorless training, or overtraining, show inconsistent results. In this study, children were trained in simultaneous discrimination problems with 3 patterns of contingencies for responding. These included positive reinforcement only, response-cost only, and both contingencies combined. It was expected that preferences for S- over neutral cues on probe trials would depend on training contingencies. Results showed an inhibitory effect of S- invariant over the 3 conditions.—*Author abstract*.

4640. Caruso, John L. & Resnick, Lauren B. (U. Pittsburgh) **Task sequence and overtraining in the learning and transfer of double classification skills.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 553-554.—Attempted to: (a) validate empirically a hypothesized hierarchical sequence of 3 double classification tasks, (b) investigate transfer to an untrained 4th double classification task, and (c) assess the effects of overtraining a relatively easy task on the learning of a more difficult task as compared with learning a related task of intermediate difficulty. 55 kindergartners, who were shown by pretesting to possess negligible double classification skills, were trained on matrix tasks involving color and shape dimensions. The hierarchical hypothesis was strongly supported and some evidence of additional transfer was found, but overtraining had no significant effect.—*Author abstract*.

4641. Francis, Robert. (Faculty of Letters & Humane Sciences, Nanterre, France) **Apprentissage perceptif et apprentissage de l'orthographe.** [Perceptual learning and learning to spell.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(6-8), 416-421.—Analysis of orthographic errors made by children indicate 3 types of errors. (a) usage, the displacement, additions, and subtractions of letters which do not change the phonetic identity, (b) rules, alteration of a word through faulty grammatical con-

struction; and (c) phonetic alterations which change a word's phonetic nature. Children given perceptual training showed significant reductions in all 3 error types when compared with their untrained controls.—*R. F. Smith*

4642. Jacobs, Paul I. & Vandevanter, Mary. (Yeshiva U., Ferkau Graduate School) **The learning and transfer of double-classification skills by first graders.** *Child Development*, 1971(Mar), Vol. 42(1), 149-159.—The double-classification problem requires S to take into account simultaneously 2 different dimensions of stimulus variation while inferring logical relations. 42 1st grade Ss matched for pretest score were randomly assigned to either an experimental or control condition. Experimental Ss were given highly structured yet individualized training in solving double-classification problems with easily labelable stimuli that varied in color and shape. These Ss scored significantly higher than control Ss on a posttest involving color and shape and on a near transfer test involving new stimulus dimensions, both immediately and 4 mo. later. There was no group difference on items from Raven's Coloured Progressive Matrices, which served as a test of remote transfer. Implications of these results for intelligence testing are considered.—*Journal abstract*

4643. Jurčo, Martin. (Research Inst. of Pedagogy, Bratislava, Czechoslovakia) **Poznávanie a praktické záujmy, ich vzťah ku schopnostiam a učebným výsledkom.** [Knowing and practical interests and their relation to abilities and learning results.] *Jednotná škola*, 1970(Apr), Vol. 22(4), 334-349.—Distinguishes between 2 types of interest: (a) knowing interest which manifests itself in the tendency to learn something new or solve problems, and (b) practical interest which manifests itself in the tendency to interfere in the course of processes, influence the properties and relations between objects, and master them. It was hypothesized that within some individuals, practical and theoretical tendencies would be in agreement or 1 would prevail. A survey of secondary general education students examined these interests and found a positive, but moderate relationship between knowing and practical interest in the respective fields. The relationships between interests and school grades, tests of proficiency, and aptitudes were positive but low. Implications for counseling students on the selection of academic specializations and vocations are discussed. (Russian summary).—*Foreign summary*

4644. Kattaker, R. J. & Daks, Larry A. (U. Missouri, Kansas City) **Errorless discrimination of alphabet letters: Effects of time and method of introducing competing stimuli.** *Journal of Experimental Education*, 1970(Sum), Vol. 38(4), 29-35.—Trained 62 4-5 yr old kindergarten children to discriminate the letters b and d when these letters were 1st presented in succession. Ss were divided with respect to the time and manner in which competing stimuli (Ss) were introduced during training. Early-late and progressive-constant dimensions of the method of S- introduction were compared, which resulted in 4 conditions: early-progressive (EP), late-progressive (LP), early-constant (EC), and late-constant (LC). Subsequently, Ss were trained to discriminate b's and d's presented simultaneously. Following this simultaneous discrimination training, stimuli were again presented in succession. Performance was analyzed in terms of the proportion of errors emitted in the presence of Ss. Progressive and early methods of S- presentations were found to be most functional in minimizing errors

during both simultaneous and successive discrimination training. Comparisons of error proportions during acquisition of the successive discrimination, to error proportions during later successive discrimination, suggested differential effects generally favorable to EP and unfavorable to LC method of presentation.—*Journal abstract*.

4645. Keenan, Verne. (U. Colorado) **Presentation method and learning-time constancy in serial learning.** *Canadian Journal of Psychology*, 1970(Oct), Vol. 24(5), 311-320.—Investigations of paired-associate, serial-anticipation, and free-recall learning have shown that the effective variable is total learning time, independent of presentation order or rate. In this light serial recall was studied as a function of 6 presentation methods and 2 presentation rates. 192 8th graders practiced word lists for 10 min. Rate did not influence recall. No differences in recall resulted from the 5 methods that presented words singly, but the whole-list presentation produced superior recall scores. Learning strategies used by Ss were discussed. (French summary) (16 ref.)—*Journal abstract*.

4646. Loadman, William E. (Indiana U.) **The effects of a mediational device on paired-associate learning: Learning and retention of sixth grade students.** *Journal of Educational Research*, 1971(Jan), Vol. 64(5), 223-225.—Attempted to determine the effect of different levels of mediational aids on a paired associate task when presented to 6th grade students for amount and rate of original learning and long-term retention. 3 levels of strategies were employed. High level mediational aids were found to significantly effect the amount and rate of original learning; the retention data also suggest similar inferences.—*Journal abstract*.

4648. Rettig, Edward B. & Clement, Paul W. (Fuller Graduate School of Psychology, Pasadena, Calif.) **Effects of variable amounts of reinforcement on a lever-pulling response in children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 687-688.—Studied 4 parameters of variable amounts of reinforcement, i.e., mean amount, peak, gap between largest and smallest amounts, and number of different amounts. Ss were 96 7-9 yr. olds. These 4 parameters were combined into 4 variable-amount reinforcement schedules on a fixed-interval paradigm. All 4 schedules increased response rate during acquisition and produced resistance to extinction; however, there were no statistically reliable differences in response rate between the 4 schedules during acquisition or extinction. A method is described for predicting relative resistance to extinction for 2 or more reinforcement schedules, prediction being based upon the 4 parameters listed above. Although "variable amounts of reinforcement" has not received much attention in operant literature, it is proposed that all intermittent schedules are merely special cases of variable-amount schedules.—*Author abstract*.

4649. Serpell, Robert. (U. Zambia, Lusaka) **Discrimination of orientation by Zambian children.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 312-316.—Presented 56 urban and 24 rural Zambian children with 4 orientation-

discrimination tasks under identical conditions to those used by R. Rudel and H. Teuber (see PA, Vol. 38:4071) among American children. A similar trend of improvement was found with increasing age and education to that observed in the American children, with a lag of 2-3 yr. Differences in difficulty among the 4 problems were closely replicated. Implications are discussed for cross-cultural differences in the incidence of orientation errors in form-copying tasks. (16 ref.)—*Journal abstract*.

Concepts & Language

4651. Baldwin, Thelma & Garvey, Catherine. **Studies in convergent communication: II. A measure of communication accuracy.** *Center for the Study of Social Organization of Schools Report*, Johns Hopkins U., 1970(Nov), No. 91, 48 p.—Defines a type of problem-solving communication in which communication accuracy is expected to be facilitated by common factors. 43 dyads of 5th grade children were observed performing 3 tasks which represent the defined type of communication. As predicted, the accuracy scores achieved in these communications were consistent across the 3 tasks. 3 components of accurate communication were identified and measures for describing the adequacy of dyads' performance of these components were derived and correlated with communication accuracy. Each component correlated significantly with accuracy and the 3 components combined accounted for 44% of the observed variance in accuracy scores. Results are interpreted as an initial step in identifying communication components which could be taught in language arts curriculum to help students communicate more accurately. The observed relationship of socioeconomic status, race, sex, and IQ characteristics of communicators to communication accuracy is presented (18 ref.)—*Journal abstract*.

4652. Bat-Haee, Mohammad A. (Pahlavi U., Shiraz, Iran) **Conservation of mass, weight, and volume in intermediate grades.** *Psychological Reports*, 1971(1 Feb), Vol. 28(1), 163-168. Tested 84 female and 97 male 4th-6th grade students for quantity conservation. Results confirm the Piaget description of the sequential attainment of the conservation of mass, weight, and volume. Sex differences were not significant. The more intelligent Ss scored better than those with lower IQs. (17 ref.)—*Journal abstract*.

4653. Dyer, George B. (U. Chicago) **Continuity and discontinuity of development in the equilibrium model.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 201-211. Through an exposition of Piaget's equilibrium model a functionally continuous process in cognitive development is identified within structurally distinct but perfection-oriented stages. A clear functional continuity which is derivative and an equally clear structural discontinuity defined by certain criteria make possible a clearer conceptualization of the notion of regression in thinking. Thinking, therefore, in an equilibrium model remains functionally the same throughout development, but is structurally different at the discrete stages or periods of that development.

4654. Furth, H. G. (Catholic U. of America. Center

for Research in Thinking & Language) **On language and knowing in Piaget's developmental theory.** *Human Development*, 1970, Vol. 13(4), 241-257.—Within Piaget's developmental theory the distinction between figurative and operative knowing is clarified and related to symbolic functioning. Acquisition of language is placed within the framework of the child's acquisition of representational behavior. Questions about the relation of thinking and language can be meaningfully discussed if one focuses on the operative aspect of thinking and the figurative aspect of language. The meaning of a symbol, verbal or otherwise, is identified with the underlying operative scheme of the user of the symbol and is not an inherent property of the symbolic material. Piaget's view is antiempiricist; yet he explains the development of the operative structures and does not posit them as innate. A propositional language becomes a chief aid to thinking at the formal operational stage; however, Piaget does not consider verbal language as a principal determiner of development at the sensorimotor or concrete operational stages.—*Journal abstract.*

4655 Garvey, Catherine & Baldwin, Thelma. **Studies in convergent communication: I. Analysis of verbal interaction.** *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*, 1970(Nov), No. 88, 79 p. Describes a study of the structure and use of language in a defined type of communication situation. A review is presented of linguistic, psychological, and sociological studies which deal with the structure of communication or the structure of discourse. A type of goal-directed or convergent communication is defined in which consistent patterns of language use are expected to occur. The language of 48 dyads of 5th grade children and 24 dyads of undergraduates was observed in 3 standard convergent communication situations and used to develop a system for analyzing the verbal interaction. The system defines structural units of the communications and permits a description of the behaviors, the connecting structural relationships, and the content occurring in and between utterances during the communication process. The manual used to instruct coders in the use of the system and the estimates of interjudge agreement obtained with the manual are presented in appendices. (32 ref.)—*Journal abstract.*

4656 Garvey, Catherine & Dickstein, Ellen. **Levels of analysis and social class differences in language.** *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*, 1970(Oct), No. 83, 14 p. —Examined the effect of level of linguistic analysis on correlations observed between language variables and status variables. 3 levels of analysis of a linguistic construction were selected for study: (a) grammatical form, (b) lexical choice, and (c) use of a predication type. The corpus was the speech of 48 dyads of 5th grade children (male, female; low, middle socioeconomic status, Negro, white) performing 3 problem solving tasks. The grammatical form of the construction differentiated between social groups, sexes, and races. Lexical choice within the construction differentiated between social groups. Use of the predication type, however, seemed to depend primarily on the task itself. Findings demonstrate that status differences in speech behavior at 1 level of linguistic analysis cannot be taken as evidence that similar status differences exist at another level.—*Journal abstract.*

4657 Gerhardt, Lydia A. (New York U.) **The role of body movement in the child's conceptualization of**

space: A multidisciplinary view. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3412.

4658 McNeill, David; Yukawa, Ryoza, & McNeill, Nobuko B. (Chicago) **The acquisition of direct and indirect objects in Japanese.** *Child Development*, 1971(Mar), Vol. 42(1), 237-249.—3, 4-, and 5-yr-old Japanese children demonstrated comprehension of imperative sentences by manipulating toys. The sentences took various forms but all included 2 nouns which were intended to be the direct and indirect objects of verbs. Evidence was found in the S's errors for self-created definitions of direct and indirect objects. Linguistic rules appeared to undergo change during the course of the experiment. Results can be understood as showing that children are guided in their behavior by certain universals of language. These give rise at times to "super-normal" sentences analogous to the supernormal stimuli of ethology.—*Journal abstract.*

4659 Nummedal, Susan D. (U. Minnesota) **The existence of the substance-weight-volume décalage.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3347.

4660 Quay, Lorence C. (Temple U.) **Language dialect, reinforcement, and the intelligence-test performance of Negro children.** *Child Development*, 1971(Mar), Vol. 42(1), 5-15.—Administered the Stanford-Binet to 100 4-yr old Negro children from Project Head Start under 2 conditions of language (standard English and Negro dialect) and 2 conditions of reinforcement (praise and candy). No reliable IQ differences among the groups and no significant interactions occurred. Differences in performance on individual Stanford-Binet items were negligible. Findings raised questions concerning the existence of motivational and language differences in young Negro children who are provided experiences designed to bring them into the mainstream culture. (19 ref.)—*Journal abstract.*

4661 Scholnick, Elin K. (U. Maryland) **Effects of stimulus availability on children's inferences.** *Child Development*, 1971(Mar), Vol. 42(1), 183-194.—5- and 7-yr-old children inferred which 1 of 4 cues (red-green-flower, or circle) was relevant on the basis of information about 2 stimuli. Tasks varied in information (positive, negative, or mixed instances), cue availability (1 or no prior instance), and presence of memory aids. Younger Ss chose forms or the dimension which changed between trials. Older Ss searched for commonalities and lacked response biases. Since both groups performed worst on tasks lacking positive instances despite variations in cue or memory and availability, poor recall of stimuli may not explain difficulty in interpreting negative information. Perhaps knowing the dimensional structure of the set is important. (21 ref.)—*Journal abstract.*

4662 Simpson, Robert E. (U. Alabama) **The effects of cognitive styles and chronological age in achieving conservation concepts of substance, weight, and volume.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3383.

4663 von Raffler Engell, Walburga. (Vanderbilt U.) **Suprasentential and substitution test in first language acquisition.** *Revue de Psychologie Appliquée*, 1968, No. 88-90, 33-41.—Discusses the acquisition of language in children including bilingual formation. There are 2 steps in acquiring a language from infancy: imitation followed by analogical extension. "In its early stages, a child's understanding of language is as gross . . . as his own production." The importance of

analogy in language is in syntax, morphology, and phonology. Neologisms as well as spontaneous creations are classified with analogical change, e.g., children's disguised speech, teenage slang, and hippie language. The rate of language acquisition depends on "functionality," the learner's participation in the communicative system. (43 ref.)—*A. M. Farfaglia.*

Abilities

4664. Cattell, Raymond B. (Illinois U.) **La teoria dell'intelligenza fluida e cristallizzata: Sua relazione con i tests "culture fair" e sua verifica in bambini dai 9 ai 12 anni.** [The theory of fluid and crystallized intelligence: Its relationship to culture free tests and its verification in 9-12 yr. old children.] *Bollettino di Psicologia Applicata*, 1968, No. 88-90, 3-22.—Studied the theory of fluid and crystallized intelligence in terms of the characteristics appropriate to each factor. A g factor includes the activity in which judgment becomes crystallized, e.g., vocabulary, numerical ability, mechanical ability; a 2nd g factor for fluid aptitude includes series and analogies. "The general crystallized aptitude factor is the product of the fluid aptitude which functions during the years of development on areas of scholastic and cultural skills." 153 boys and 153 girls (9-12 yr. old) were given culture free tests. It is concluded that the culture free test offers greater possibility of analytical prediction. In every case the results favor the use of the double IQ in applied psychology: 1 founded on the fluid g factor, and the other founded on the crystallized g factor. (41 ref.)—*A. M. Farfaglia.*

4665. Crockett, David; Klonoff, Harry, & Bjerring, James. (U. British Columbia, Vancouver, Canada) **Factor analysis of neuropsychological tests.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 791-802.—Administered the Halstead-Reitan Battery, 2 Benton tests, and the WISC to a sample of 240 normal 5-8 yr. old children. Results of a principal-component factor analysis indicate that at least 9 different areas were being measured. The areas of neuropsychological functioning were: analytic-synthetic visual-motor ability, undirected motor speed, verbal abstract ability, resistance to distraction, ability to alternate between motor sets, directed motor speed, environmental awareness and judgmental skills, sequencing visual stimuli, and checking behavior. Regression weights and composite score formulae for estimating Ss' scores in these 9 areas were presented. Dimensions were found which correspond to the Verbal-Performance division of the WISC. 5 of the factors were found to be relatively independent of psychometric measures of intelligence. 2 factors involving higher-order complex skills were also found. The derived factors were related to other factor analytic studies. (16 ref.)—*Journal abstract.*

4666. Doubras, Steve G. & Mascarenhas, Juliet. (Diocesan Child Guidance Center, Columbus, O.) **Relations among Wechsler full-scale scores, Organicity-sensitive Subtest scores and Bender-Gestalt errors scores.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 719-722.—To help clarify the nature of associations between the Bender-Gestalt Visual Motor test and WISC scores, the test records of 71 6-12 yr. old children were examined. Intercorrelations (-.22 to -.43) showed significant relationships between the 2 tests in all instances but 1. Age appeared to have a significant effect on the G. Pascal and B. Suttell scoring of the

Bender but sex differences were negligible.—*Journal abstract.*

4667. Fiedler, Miriam F. & Schmidt, Ellen P. (Children's Hosp. Medical Center, Boston, Mass.) **Sex differences in Bender-Gestalt drawings of seven-year-old children.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 753-754.—Tests a nonclinic population of 7-yr-old children, 300 boys and 300 girls, with the Bender Visual Motor Gestalt test and their protocols scored by the Koppitz system. No significant sex differences were found when the mean raw scores were compared. Similar studies of nonclinic populations at different age levels are indicated.—*Journal abstract.*

4668. Flammer, August, et al. (U. Fribourg, Inst. de Pédagogie Curative, Switzerland) **Bildertest 2-3 (BT 2-3): Intelligenztest für 1., 2. und 3. Schulklassen.** [Picture Test 2-3: Intelligence test for 1st, 2nd and 3rd classes of Swiss elementary schools.] Basel, Switzerland: Beltz Schooltests for Switzerland, 1971. 31 p.—This is a Swiss adaptation of Emmet's Deeside Picture Test for Seven-Year-Olds after the 1966 German adaptation by Ingenkamp. Item analyses with n's of 444 and 487 forced an alteration of 9 items and the replacement of 4 others. Split-half reliability coefficients varied about .96 for the total test and .80 for the 7 subtests. Norms (percentiles, T, stanines) are based on n=1800. External criterion and factor analytic validity results are included.—*Author abstract.*

4669. Guinagh, Barry J. (U. Florida) **An experimental study of basic learning ability and intelligence in low-socioeconomic-status children.** *Child Development*, 1971(Mar), Vol. 42(1), 27-36.—Examined 2 constructs, basic learning ability and intelligence, as proposed by A. Jensen to explain the different patterns of ability found in middle and low socioeconomic status (SES) levels. Basic learning ability was measure by Raven's Progressive Matrices (RPM). 40 low-SES Negro and 40 low-SES white 3rd graders were tested. Training on the RPM had different effects on the 2 races. In the low-SES white sample, both the high and low digit-span groups had scores on the RPM posttest significantly greater than their respective control groups. In the low-SES Negro group, only the high digit-span experimental group had RPM posttest scores larger than its control group. The low digit-span group did not gain from the experimental treatment.—*Journal abstract.*

4670. Kennett, K. F. & Cropley, A. J. (U. Saskatchewan, Div. of Social Sciences, Regina, Canada) **Intelligence, family size and socio-economic status.** *Journal of Biosocial Science*, 1970(Jul), Vol. 2(3), 227-236.—Tested a sample of 170 11-15 yr. old Regina schoolchildren, divided into subgroups according to schoolchildren, divided into subgroups according to family size and socioeconomic status, on the Otis Beta Mental Ability Test. Results demonstrate the existence of a definite relationship between intelligence and socioeconomic status, but no significant relationship between family size and IQ, except among low socioeconomic status males. These results, interpreted as reflecting the changing relationship between intelligence and family size, are possibly the outcome of a changing fertility pattern within the various socioeconomic status groups. (43 ref.)—*Journal abstract.*

4671. Stein, Aletha H., Pohly, Sheila R., & Mueller, Edward. (Pennsylvania State U.) **The influence of masculine, feminine, and neutral tasks on children's achievement behavior, expectancies of success, and attainment values.** *Child Development*, 1971(Mar),

Vol. 42(1), 195-207.—Tested the hypothesis that children's attainment values (AV), expectancies of success (Exp), and achievement behavior (time spent on a task) would be greatest on a sex-appropriate test, intermediate on a neutral test, and least on a sex-inappropriate test. 96 6th grade boys and girls were given 3 tests introduced as measures of masculine, feminine, and neutral skills. For boys, the hypothesis was strongly supported on all measures. For girls, AV and Exp scores were approximately equal on the feminine and neutral tests, but significantly lower on the masculine test; girls' time scores on the 3 tests did not differ. A measure of masculine and feminine role preferences partially predicted girls' AV and time scores but was not related to any of the measures for boys. (15 ref.)—*Journal abstract.*

Perception

4672. Black, Kathryn N., Williams, Tannis M., & Brown, D. R. (Purdue U.) A developmental study of preschool children's preference for random forms. *Child Development*, 1971(Mar), Vol. 42(1), 57-61.—Presented pairs of polygons containing 4, 8, 12, 16, and 20 sides in random order to preschool children. The 8-sided form was most preferred by a group of 3-yr-old Ss (10 girls and 8 boys), while the 12-sided form was most preferred by a group of 4-yr-old Ss (8 girls and 6 boys). The functions relating stated preference to complexity level, defined as sidedness, were significantly different for the 2 groups. 1 yr. later the preferences of the younger group had changed. Now 4 yr. of age, they chose the more complex stimuli more frequently than previously. It is suggested that preferences may be multidimensionally determined.—*Journal abstract.*

4673. Concannon, Josephina. (Boston Coll.) A review of research on haptic perception. *Journal of Educational Research*, 1970(Feb), Vol. 63(6), 250-252.—Formulated by Piaget and indirectly brought into focus by the Montessori methodology, haptic perception is a relatively new concept in American education. Work in England and Russia antedates that found in the United States. J. Concannon and J. V. Coyle completed studies in haptic perception with young children from Montessori and non-Montessori classes. Differences in kind of treatment were nonsignificant (individual vs. group teaching) while Ss in Montessori classes differed significantly from non-Montessori Ss. (27 ref.) *Journal abstract.*

4674. Glitter, A. George & Quincy, Arthur J. (Boston U.) Race and sex differences among children in perception of emotion. (RC Report, Boston U., 1968(Sep), No. 27, 26 p.) Utilized a $2 \times 2 \times 2$ factorial design to investigate the effects of race of expressor (3 Negro and 3 white adults), and race and sex of perceiver (40 white and 40 Negro 4-6 yr. old males and females) on perception of emotion (POE) in children. Perception of anger, happiness, surprise, and pain was analyzed in terms of 3 scores as dependent variables (DVs): (a) overall accuracy scores, (b) correct perception of individual emotions scores, and (c) erroneous perception of individual emotions scores. Results indicate insignificant main and interaction effects for all of the DVs. Theoretical implications of the impact of cultural forces on POE are discussed. (4 p. ref.) *Journal abstract.*

4675. Graham, Louella W. & House, Arthur S. (Imory U.) Phonological oppositions in children: A perceptual study. *Journal of the Acoustical Society of America*, 1971(Feb), Vol. 49(2, Pt. 2), 559-566. Studied

the relationship between the development of a phonological system and auditory perception by examining the errors of 30 3-4 yr. old girls in discriminating among a group of English consonants. The perceptual equivalence and additivity of linguistic features were studied. A nonmetric multidimensional analysis procedure was used in an attempt to specify the number of processes by which Ss made decisions, and speculations about the nature of these processes were made. The discrimination errors of the Ss were similar to those of adults, except that Ss produced more errors. Results failed to show that current linguistic descriptions identify the perceptual parameters children use in categorizing speech sounds. (22 ref.) *Journal abstract.*

4676. Hill, Patricia J. Visual motor perceptual performance as compared with tests of recognition. *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Jun), Vol. 47(6), 469-473.—The Perceptual Forms Test for visual motor perception is currently used by some optometrists to predict the general achievement of school children. The ability of 50 3rd and 4th graders to copy specific geometric forms was compared with their ability to recognize parts of these forms when varying the spatial orientation on paper. Although other studies show that there was some relation to these functions in kindergarten, results reveal no relation between the ability of 3rd and 4th grade Ss to reproduce forms and their ability to discriminate and recognize forms. *Journal abstract.*

4677. Klapper, Zelda S. & Birch, Herbert G. (Albert Einstein Coll. of Medicine, Yeshiva U.) Perceptual and action equivalence to objects and photographs in children. *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 763-771. Compared the pantomime responses given by 134 3-9 yr. old middle class children of normal intelligence to real objects and to pictures of them on the Peabody Picture Vocabulary Test. Results indicate that up to age 7 photographs of objects were not equivalent to the objects they pictorially represented as directive stimuli for appropriate action. Although equivalence in perceptual recognition was present even in the youngest Ss, equivalence between object and picture in directing action was increasingly manifested over a period of years. Findings suggest that the processes underlying the discrimination of differences and the recognition of sameness are not necessarily identical with those which underlie the use of perceptual attributes for the direction of action. The findings are considered in relation to verbal and other features of mediation. *Journal abstract.*

4678. Kostić, Djordje; Duić, Rhea S., Vladavljević, S., & Blagojević, D. (Inst. for Experimental Phonetics & Speech Pathology, Belgrade, Yugoslavia) Children's verbal responses to phonetically different auditory stimuli. *International Journal of Psychology*, 1970, Vol. 5(3), 161-171. 20 6-yr. old normal Ss in Belgrade, 10 of whom were normal in articulation and possessed the intelligence, repeated verbal stimuli presented in the phonological structures of Serbo-Croatian or English. Responses of normal Ss differed significantly from responses of abnormal Ss for 7 of the 10 stimuli on dimensions of duration, accentuation, tonality, and quality of pronunciation. Since no significant differences occurred in responses to pure tones and to noise extracted from speech sounds of the Ss language sensory apparatus, per se cannot account for the observed differences. Results suggest that the feedback process involved in language

development utilizes, not only sensory receptors and cortical centers, but conditioning of higher centers as well. Linguistics and psychology appear to complement each other in the understanding of language phenomena. (French abstract)—*S. E. Gavin.*

4679. **Prince, Albert I.** (Marietta Coll.) **A vanished visual cue for auditory perception.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 673-674.—Loudness detection thresholds were obtained from 4 3rd graders by a modified Békésy technique. Ss were provided a visual cue for auditory perception by a light that changed in brightness as the auditory stimulus changed in intensity. The light was systematically vanished during the initial quarter of each test session. Ss learned to monitor and adjust the auditory test stimulus more quickly with visual help and their detection thresholds were lower and more reliable. This audiometric procedure appears to be applicable to developmentally retarded children because it can be taught without verbal instructions and generates fewer disruptive emotional responses.—*Author abstract.*

4680. **Shantz, Carolyn U. & Watson, John S.** (Merrill-Palmer Inst., Detroit, Mich.) **Spatial abilities and spatial egocentrism in the young child.** *Child Development*, 1971(Mar), Vol. 42(1), 171-181.—Hypothesized that the ability of the young child to predict the location of objects on a mock landscape after he has physically moved around the landscape is positively related to his ability to identify object locations from another's (doll's) viewpoint. Each of 48 3½-6½ yr. old children predicted object sites on a covered landscape after moving 180° and 90°, and on 2 trials were confronted with a "trick" perspective. A modified version of Piaget's mountain-scene task was also administered as a measure of spatial egocentrism. There was a significant relation between the number of errors on the 2 tasks. Of those Ss who verbally recognized the 1st trick perspective, significantly more had had some success on the egocentrism task compared with the number of Ss who completely failed it. Generally, predicting object sites when the child himself moves is an easy task in this age range, but identifying object locations from another's viewpoint is very difficult. There were no significant differences among the 3 age groups in accuracy on either task.—*Journal abstract.*

Personality

4681. **Bradfer-Blomart, J.** (Free U., Brussels, Belgium) **Analyse des thèmes fournis au CAT par des garçons de huit ans: Comparaison des récats d'un groupe de garçons et de filles du même âge.** [Analysis of themes in CAT responses of eight-year-old boys: Comparison of the replies of a group of boys and girls of the same age.] *Enfance*, 1970(May), No. 2, 215-234.—Compared the Children's Apperception Test responses of 50 8-yr-old boys from 3 schools in Brussels with those obtained from a similar sample of girls. There was considerable similarity but the boys were less prone to oppose adult control, gave more common responses, and revealed less aggressive feeling. Girls revealed themselves more and in general were more mature in their manner of responding.—*S. S. Marzolf.*

4682. **Buchanan, Edith B.** (U. California, Los Angeles) **The relationship of affective behavior to movement patterns, body image, and visual perception in four-**

and five-year old children. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3406.

4683. **Croake, James & Knox, Frances H.** (Florida State U.) **A reinvestigation of fear retention and dissonance theory.** *Psychology*, 1971(Feb), Vol. 8(1), 51-53.—Attempted to account for the retention of children's fears within a theoretical frame of cognitive dissonance. It was assumed that an individual would likely avoid and minimize references that indicate that he should not retain a given fear. Festinger contends that 1 method of reducing dissonance is to proselytize. As evidence that proselytizing has occurred, an effort was made to confirm that the more unrealistic and intense fears would be more widely held than the less unrealistic and less intense fears. 212 children from 4 Southeastern states were sampled. Ss were compared on a 69-item checklist of fears. The results, although in the predicted direction, were not significant.—*J. A. Blazer.*

4684. **Guilford, Joan S. & Gupta, Willa.** (Sheridan Psychological Service, Los Angeles, Calif.) **Development of the Values Inventory for Children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 513-514.—The purpose of this developmental project was to construct an objective, self-administering inventory of values which could be used at the 1st, 2nd, and 3rd grade levels and which would be equally useful for children in the major United States ethnic groups: Anglos, Orientals, Mexican-Americans, Negroes, and Indians. The 60-item test was administered to 996 children equally divided with respect to ethnic group, grade level, and sex. The results were factor-analyzed, providing 8 meaningful factors: social conformity, academic health, me first, masculinity, adult closeness, sociability, aesthetic, and asocial behavior. Interethnic comparisons suggested value conflicts which might affect success in school.

4685. **Orpen, Christopher.** (U. Cape Town, South Africa) **The effect of cultural factors on the relationship between prejudice and personality.** *Journal of Psychology*, 1971(May), Vol. 78(1), 73-79. —92 English-speaking schoolchildren reared in the relatively "prejudiced" climate of white South Africa were given 2 measures of prejudice toward minority groups, a special measure of "South Africanism" and 2 measures of personality, Rokeach's Dogmatism Scale and Smith and Rosen's Worldminded scale. The high correlations between South Africanism and the measures of prejudice, together with the insignificant correlations between these measures and dogmatism or worldmindedness, was taken as evidence that it is accommodation to cultural norms rather than deep-lying personality trends that determines the holding of prejudiced views in this "prejudiced" climate. (22 ref.)—*Author abstract.*

4686. **Ozechosky, Richard J. & Clark, Edward T.** (St John's U., Jamaica, N.Y.) **Verbal and non-verbal measures of self-concept among kindergarten boys and girls.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 195-199.—Describes a comparison of the criterion-related validity of a verbal (sentence-completion test) and of a nonverbal (pictorial) measure of self-concept. Following teacher ratings of 1042 kindergartners, high and low self-concept criterion groups were established. Each S was administered the Quantified Self-Concept Inventory and a new nonverbal test. Congruence was noted between assessments of S's self-concept by teacher's ratings and by a nonverbal instrument. It is concluded that verbal devices, e.g., sentence-completion

tests have little validity at the kindergarten level.

4688. Thomas, Alexander; Chess, Stella, & Birch, Herbert G. (New York U., Medical School) **The origin of personality.** *Scientific American*, 1970(Aug), Vol. 223(2), 102-109.—Behavioral characteristics of 141 children were longitudinally studied for over a decade. A behavioral profile, defining a child's temperament, was obtained for each child based on ratings of each of 9 characteristics on a 3-point scale. Results indicate that the original temperament tended to persist in most Ss over the course of the study. 3 general types of temperament were defined (although some Ss did not fit into any of the 3). Implications for parental guidance, education, and medical and psychiatric treatment are discussed.—*P. Tolin.*

4689. Walsh, Richard P. (Southern Illinois U., Edwardsville) **Generalization of self-control in children.** *Journal of Educational Research*, 1969(Jul), Vol. 62(10), 464-466.—Compared self-control in the classroom, in an isolated temptation situation, and at home. Ss were 114 6-8 yr. olds, who were rated on 5 control indicators by their teachers. Each S was placed in a room with toys that they were warned not to touch. Also, 55 were observed at home where trinkets were exposed in E's attache case. Of those without control in isolation, 75% were well controlled at home. Of those with high control in isolation, 34% displayed less control at home. Teachers ratings of classroom control tended to agree with isolation behavior, but less so with home control. Results suggest that generalizability of self-control did occur, but individual differences were also present.—*Journal abstract.*

Social Behavior

4690. Estes, B. W. & Rush, D. (U. Kentucky) **Social schemas: A developmental study.** *Journal of Psychology*, 1971(May), Vol. 78(1), 119-123.—Investigated the development of social schemas using 214 Ss: 14 3- and 4-yr-olds, and 20 Ss at each yr. from 6-15 yr. Powerful regularities and a strong developmental progression were found which reflected an increasing awareness of how people "go together." With increasing age, children learn the meanings of human situations and perform like adult Ss as reported in previous investigations.—*Author abstract.*

4691. Gramza, Anthony F. & Witt, Peter A. (U. Illinois, Children's Research Center) **Choices of colored blocks in the play of preschool children.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 783-787.—35 4-5 yr. old nursery schoolchildren were given trials during which they were allowed to play with blocks colored red, blue, green, and gray that were presented in varied spatial arrays. Position preferences were more important than color preferences in Ss' use of blocks. The prominent role of stimulus context in play behavior is emphasized.—*Journal abstract.*

4692. Grusec, Joan E. (U. Toronto, Ontario, Canada) **Power and the internalization of self-denial.** *Child Development*, 1971(Mar), Vol. 42(1), 93-105.—Children observed an adult model who controlled resources important to them (a powerful model) or one who had no

power to administer rewards. The model then played a game and displayed self-denial by donating $\frac{1}{2}$ his winnings to charity in Exp. I with 24 7-11 yr. old boys and 24 7-11 yr. old girls, and rewarding himself only for excellent performance in Exp. II with 20 7-11 yr. old boys and 20 7-11 yr. old girls. When Ss played the game alone, those who had observed the powerful model shared more or set higher standards of self-reward than those exposed to a model low in power. In the sharing study the model's nurturance was also manipulated. There was a tendency ($p < .07$) for nurtured Ss to share less than nonnurtured Ss. From this and other studies it appears that nurturance facilitates imitation of only neutral behaviors, while power facilitates imitation of both neutral and self-denial or aversive behaviors. The theoretical implications of this are discussed.—*Journal abstract.*

4693. Hicks, David J. (Chico State Coll.) **Girls' attitudes toward modeled behaviors and the content of imitative private play.** *Child Development*, 1971(Mar), Vol. 42(1), 139-147.—Examined the relationship between female attitudes toward modeled behaviors and imitative performance. 25 88-119 mo. old girls viewed and rated a series of behavioral displays. 2 mo. later, another viewing followed by a judged performance opportunity was conducted. Results indicate that Ss' imitation of modeled behavior was markedly related to their attitudes toward it. Some evidence demonstrated that varied elements within a model's display can serve as the basis for such children's attitudes.—*Journal abstract.*

4694. Jasperse, Coby S. & van Hekken, Suus M. (Free U., Amsterdam, Netherlands) **Effect of nurturance on imitative behavior.** *Psychological Reports*, 1971(1 eb), Vol. 28(1), 201-202.—Reports a partial replication of P. Mussen and A. Parker (see PA Vol. 39 12022) testing the hypothesis that a model's nurturance enhances the imitation of task-relevant behavior but not of task-irrelevant behavior. 24 5-6 yr. old girls either interacted for 15 min. with a friendly model or played alone for 15 min. In a subsequent individual session the model solved 3 Porteus Mazes during which she performed also 4 irrelevant acts. Thereafter, Ss had to solve the same mazes. Results confirm the hypothesis.—*Journal abstract.*

4695. Kabaié-Husza, Anónia. (Hungarian Academy of Sciences, Inst. of Psychology Budapest) **A csecsemőotthonban nevelkedő 1-36 hónapos gyermek szociális érzelmének alakulása játékhelyzetekben.** [Trend of emotions manifested towards grown-ups during play in institutionalized children aged 1-36 months.] *Psychológiai Tanulmányok*, 1968, No. 11, 299-315.—Analyzed data of 434 institutionalized and 432 family-raised children to reveal the trend of emotional reactions elicited by adults in prearranged play situations. A significant correlation between environment and the children's behavior was found. Behavioral forms of institutionalized children were summarized as follows: (a) active acceptance of the contact with adults; (b) in the play situation the presence of and contact with the adult is of greater importance than the playing activity; and (c) reaction to the breaking off of contact already in the 1st yr. but acceptance of the departure of the adult with passive resignation from the 2nd yr. on. However, the child will make an attempt at restoring the contact up to age 2; responses elicited by the adult's conduct are similar to those following a

negative emotional manifestation of an adult. Prohibitions are understood only above 2 yr., which is a lag of 6 mo. behind the family-reared child. Prohibitions make the child offended and depressed. The affective catering in institutions may give some amount of security to the children and lower the deprivation. It is debatable whether the foster-mother relation established within institutions is preferable to the nurse-infant relation. (Russian summary) (20 ref.).—*English summary*.

4696. Lorber, Neil M. (Newark State Coll.) **Permissive home environment and exploitative-dominating preadolescent peer behavior.** *Psychology*, 1971(Feb), Vol. 8(1), 12-15.—Defines exploitative-dominating (E-D) peer behavior as social relations involving the use of one's peers for one's advantage and their control and manipulation for one's self-serving purposes. 43 teachers of 9 groups of 7th graders rated each S on the degree of E-D behavior displayed by each. An 18-question instrument for parents was developed to assess parental permissiveness in the home. To "a statistically significant extent [.01 level], parents of preadolescents with pronounced E-D scores reported greater permissiveness in their homes than parents of preadolescents with moderate E-D scores and, especially, parents of preadolescents with slight E-D scores. The findings therefore lend support to the contention that children who tend to exploit and dominate their peers are more apt to come from relatively permissive homes than children who do not tend to display such social behavior. In this light and to this extent, the outcomes of the study contribute to the viewpoint that permissive upbringing does not generally encourage optimum socialization and social adjustment on the part of children. In addition, the results of the study suggest the need for closer investigation of permissiveness."—S. Knapp.

4697. Masters, John C. & Driscoll, Sally A. (U. Minnesota) **Children's "Imitation" as a function of the presence or absence of a model and the description of his instrumental behaviors.** *Child Development*, 1971(Mar), Vol. 42(1), 161-170.—In 2 experiments with 16 and 10 4-yr-old nursery school-children, respectively, Ss heard a story which described toys arranged in novel ways. A performance-description story included a model who actively arranged the toys. A location-description story described the toys as already arranged, and the model simply discovered them so. A location-description, no-model story described the toys as already arranged, but no model was mentioned. Ss in the control conditions heard a story in which toys were mentioned but not arranged in any novel fashion. Imitation was defined as the extent to which Ss subsequently arranged toys in a fashion similar to that described in the story. Ss who had heard descriptions of the novel arrangement of toys "imitated" more than the controls, regardless of whether the model was present or absent or whether his instrumental behaviors were described.—*Journal abstract*.

4698. Rivenbark, W. H. (U. Alabama) **Self-disclosure patterns among adolescents.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 35-42.—Investigated self-disclosure behavior in late childhood and adolescence. 149 Ss in grades 4, 6, 8, 10, and 12 were administered a modified form of S. M. Jourard's self-disclosure questionnaire. It was observed, as hypothesized, that (a) girls disclose more than boys, (b) disclosure to peer targets increases with age, (c) mothers are favored over fathers

as disclosure targets, and (d) same-sex peers are disclosed to more than those of the opposite sex. Disclosure difference between boys and girls increased with age only for disclosure to parents. No difference in over-all disclosure to male and female peer targets was observed. (15 ref.).—*Journal abstract*.

4699. Selman, Robert L. (Boston U.) **The relation of role taking to the development of moral judgment in children.** *Child Development*, 1971(Mar), Vol. 42(1), 79-91.—In order to explore the relationship in middle childhood between 2 social-cognitive processes, role-taking ability, and moral reasoning, 60 8-, 9-, and 10-yr-old middle-class children (10 boys and 10 girls at each age) were administered Kohlberg's Moral Judgment Scale, 2 role-taking tasks, and the Peabody Picture Vocabulary Test. Results indicate that at this age range, with intelligence controlled, the development of reciprocal role-taking skills related to the development of conventional moral judgment. Results of a reexamination 1 yr. later of 10 Ss whose role-taking and moral-judgment levels were low in the original study support the hypothesis that the development of the ability to understand the reciprocal nature of interpersonal relations is a necessary but not sufficient condition for the development of conventional moral thought.—*Journal abstract*.

4702. Bruni, Pietro. **Analisi fattoriale e contributo alla validazione esterna del Parental Attitude Research Instrument (P.A.R.I.).** [Factorial analysis and contribution to the external validity of the Parental Attitude Research Instrument (PARI).] *Bollettino di Psicologia Applicata*, 1968, No. 88-90, 77-86.—Studied the external validity and factorial analysis of the Parental Attitude Research Instrument (PARI). The PARI is a questionnaire on the raising and education of children, applicable in various fields of psychology. A survey was conducted in 30 families composed of mother, father and child. The factorial analysis was determined after studying the records of 283 female Ss (18-52 yr. old). A scale of "family gratification" was also devised. The following examples of gratifying situations were chosen: (a) parents' favoring association with both sexes of the child's age group, (b) parents' approval of sports and other types of recreation, (c) not exercising control over selection of friends, (d) not overemphasizing studies, (e) showing affection, and (f) collaboration between parents and children concerning decisions. 3 factors were isolated from the factorial analysis of the PARI: (a) hyperprotective and authoritarian type discipline, (b) rejection of the domestic role on the part of females, and (c) possessive authoritarianism. These factors are similar to results obtained in the United States. There is a definite relationship between attitudes declared in the questionnaire and the usual behavior of the Ss.—A. M. Farfaglia.

4703. Christophersen, Edward R. & Arnold, Caroline

M. (U. Kansas, Medical Center) **A behavior modification program for parents of children with behavior problems.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 665-666.—A set of token reinforcement procedures, based on E. L. Phillips (see PA, Vol. 43:7134), were instituted to modify the behavior of an 11-yr-old boy who lived at home with his mother. Points, earned for specified appropriate behaviors and lost for specified inappropriate behaviors, were redeemable for a variety of privileges. During temporary removal of the point system (a vacation) Ss' maintenance behaviors decreased while his social behaviors remained stable. Reinstatement of the point system brought the maintenance behaviors back to the prevocation level. Token reinforcement procedures in the natural family setting appear practical and effective for dealing with behavior problems.—*Author abstract.*

4704. Hall, R. Vance, et al. (U. Kansas) **Modification of behavior problems in the home with a parent as observer and experimenter.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 669-670.—Presents 4 experiments in which parents devised and conducted procedures to alleviate their children's behavior problems. The techniques involved different types of positive reinforcement, extinction and punishment. The behavior difficulties included infrequent use of an orthodontic device, the low-level performance of household tasks, whining and shouting, and a long duration of dressing time. The parents used recording procedures which did not upset the daily routine, and demonstrated that scientific rigor can be applied in a household setting.—*Author abstract.*

4705. Kogan, Kate L. & Wimberger, Herbert C. (U. Washington, Medical School) **Sex role and relative status in the relationship of mothers to children.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 782.—Studies Mother \times Child social interaction in 10 pairs of Head Start Ss and 10 pairs of middle- and upper-class Ss in unstructured play situations. Units of analysis were 4-sec intervals, 1260 of which were examined for each S pair. Results demonstrate a strong differential relationship between the amount of high-status control afforded by the S's environment and the role expectations and social reinforcement afforded by his sex.—*P. Hertzberg.*

4707. Murlidharan, Rajalakshmi & Topa, Venita. (National Council of Educational Research & Training, New Delhi, India) **Need for achievement and independence training.** *Indian Journal of Psychology*, 1970(Mar), Vol. 45(1), 1-21.—Attempted to probe into the nature of the relationship between independence training and need for achievement in the Indian population and to examine if it operates differently in the Western and Indian cultures. Ss were 42 5 yr. olds belonging to the lower-middle socioeconomic strata of Delhi. Aronson's Graphic Expression Test was used for assessing need for achievement in the Ss. The nature of independence training imparted by the mothers was ascertained by interviewing the mothers. The questionnaire used was an Indian adaptation of the one used by Winterbottom. Along with this, a thorough investigation of the child's background was made under 10

headings. Results indicate in general a relationship between independence training imparted in early childhood and the development of need for achievement in the child. Although the results are in keeping with Winterbottom's study on an American sample, the Indian samples showed some sex differences which were not noted in the American study.—*B. Roy.*

4708. Schuhan, Anthony I. & Freshley, Harold B. (U. Oklahoma, Medical Center, Oklahoma City) **Significance of the nonverbal dimension of family interaction.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 455-456.—The interaction of 4 family triads was scored under conditions of access to (a) only the verbal content of the family's interaction, and (b) access to the family's verbal interaction plus the nonverbal activity contained in a videotape recording of their discussions. 3 of the 4 families showed a significantly different interaction profile when their nonverbal interaction was taken into account. The inclusion of nonverbal interaction had the effect of changing behaviors originally classified as instrumental to behaviors interpreted as affective, especially to negative affective tension indicators. Implications for investigators pursuing research in family interaction processes are discussed.—*Author abstract.*

ADOLESCENCE

4710. Amerio, Piero. **Componenti psicologiche dei fenomeni di "irrealità": Evidenziati in esperienze di livello di aspirazione: Contributi sperimentali.** [Psychological components of the phenomena of unreality: Evidenced in experiments of the level of aspiration: Experimental contribution.] *Bollettino di Psicologia Applicata*, 1968, No. 88 90, 63 72. Studied the psychological meaning of N. Cassel's "unreality" by means of its concurrence with other types of variables, and sought a new experimental contribution to the problem of affective and emotional factors on the perceptive and cognitive activity. 104 16-yr-old students were given Cassel's Group Level of Aspiration Test (CGAT) and P. Amerio's Color Naming after being given R. Cattell's Scale of Anxiety, T.P.P.S. and Raven's Progressive Matrices test. It is concluded that this study confirms Cassel's phenomena of unreality. 2 types of personalities emerge from the CGAT. 1 type has high but realistic aspirations and is an individual who is sure of himself. The other, too, has high aspirations but not in proportion to his potential; he is insecure, anxious, and incapable of valid human relationships on an affective level. The interference of emotional factors on the cognitive level occurs at the moment of decision (19 ref.)—*A. M. Farfaglia.*

4711. Buckley, John J. (Wayne State U.) **The dreams of young adults: A sociological analysis of eleven hundred and thirty-three dreams of black and white students.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3635.

4712. Dacey, John S. & Madaus, George F. (Boston Coll.) **An analysis of two hypotheses concerning the relationship between creativity and intelligence.** *Journal of Educational Research*, 1971(Jan), Vol. 64(5), 213-216. Tested Q. McNemar's hypothesis that at high IQ levels there will be a wide range of creativity, whereas

at the average IQ and lower levels the scatter for creativity will be less and less. Ss were 867 American 8th grade junior high school students and 182 Irish secondary school students. In the American sample, divergent thinking was measured by 4 tests adopted from those of Torrance, and the Lorge-Thorndike Intelligence Test, Level 4, Form A, Verbal Battery. Selected tests from the Minnesota Tests of Creative Thinking and the AH 4 General Test of Intelligence were administered to the Irish sample. In both samples the IQ distributions were divided into 3 equal ranges. A 1-way analysis of variance and a correlational analysis were performed. Results offer only slight support for the McNemar hypothesis. 3 possible explanations of these findings are suggested. (20 ref.)—*Journal abstract.*

4713. Entwistle, Doris R. & Greenberger, Ellen. A survey of cognitive styles in Maryland ninth graders: IV. Views of women's roles. *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.* 1970(Nov), No. 89, 26 p.—Examines the acquisition of a few specific attitudes: whether women should work, what kinds of jobs women should hold, and whether women are intellectually curious. Views of women's work role held by 575 9th grade boys and girls in Maryland are sampled with respondents drawn from 7 residential areas chosen to typify segments of the United States population. Boys were consistently more conservative than girls. Although in general Ss of higher IQ held liberal views, middle-class boys of high IQ were the least liberal. Negro Ss were less opposed than white Ss to women's working outside the home, but were just as conservative about women's holding men's jobs as other groups. The greatest differences between girls' and boys' views were found for middle-class whites.—*Journal abstract.*

4714. Erikson, Erik H. (Harvard U.) Reflections on the dissent of contemporary youth. *Daedalus*, 1970(Win), Vol. 99(1), 154-176.—A certain amount of identity confusion, if not crisis, is beneficial at a certain stage of psychosocial development. Youth in advanced industrial cultures today tends to reject the status quo, yet is disillusioned with the long-range results of all known revolutionary movements. The condition is one of confused rebellion, which may be characterized as a revolt of the dependent. Many specific phenomena of youth protests during recent years are readily related to, and in a measure explained by classical depth psychological mechanisms. This thesis does not deny the ethical validity or the social import of some protests. The universal semiawareness that social progress involves the same governmental forms that are presupposed by preparation for possible suicidal conflict, shifts some of the psychodynamic patterns into a configuration unknown to classical psychoanalytic theory. The clinician, furthermore, is involved in the very dilemmas he is called upon to ameliorate.—*R. F. Creegan.*

4715. Gardner, R. C., Taylor, D. M., & Feenstra, H. J. (U. Western Ontario, London, Canada) Ethnic stereotypes: Attitudes or beliefs? *Canadian Journal of Psychology*, 1970(Oct), Vol. 24(5), 321-334.—Used a factor-analytic approach to investigate the role of both parents' and children's attitudes on children's reactions to French-speaking and English-speaking people. Ss were 111 14-15 yr. old English-speaking students and their parents. Findings support the conclusion that 2 components influence the tendency of children to ascribe traits to ethnic groups: (a) their attitudes toward the group, and (b) the community-wide stereotypes about

the group. Other findings indicate that children's general authoritarian attitudes reflect those of their parents, but that their attitudes toward French-speaking people are not highly related to those of their parents. (French summary) (20 ref.)—*Journal abstract.*

4716. Harsányi, István. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) *Milyen személyiségtulajdonságok megjelölésével értékelik egymást iskolásaink?* [Verbalized personality traits on the basis of which our school-children judge each other.] *Pszichológiai Tanulmányok*, 1968, No. 11, 199-215.—Pupils in 4 forms of Budapest schools (2 junior high and 2 secondary with 1 male form and 1 female form in each age group), filled in a sociometric questionnaire containing questions as to (a) cooperation in learning together, (b) camping in the same tent, and (c) which of their classmates would merit their confidence when they had grown up and were in need of expert advice. There were 3 other questions asking for the same information but worded negatively. Ss justified their choice by specifying at least 1 trait. The most frequent traits figuring in the reasons given for both the positive and negative judgment were collected and ranked. The most highly appreciated personality traits were reliability, helpfulness, orderliness, exactitude, gaiety, intelligence, compatibility, and cleverness. The main reasons for negative judgments were character traits, e.g., laziness, truancy, showing off, querulousness. At 1st sight no important differences appeared between the 2 age groups (13-14 and 17-18) nor between sexes, but on closer examination shifts in ratios due to age and sex could be detected. These, however, have no bearing on educational practice and need not be necessarily considered by the teacher. The differences would be more marked if more distant age groups were compared and research in this direction is recommended. (Russian summary) (18 ref.)—*English summary.*

4717. Kelly, Delos H. (U. Oregon) Social class, school status, and self-evaluation as related to adolescent values, success, and deviance. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3656.

4718. Kollárik, Teodor. (Inst. for the Training of Executives in Chemical Industry, Bratislava, Czechoslovakia) *K problematike konfliktových situácií u mládeže.* [Conflicting situations in young people.] *Jednotná škola*, 1969(Sep), Vol. 21(7), 625-647.—Investigated the occurrence of internal and external conflicts in connection with social adjustment and acceptability in teenagers. 286 16-18 yr. old boys and girls completed questionnaires. Ss reported the greatest number of conflicts with companions of the same age, then with parents, and last with teachers. Boys reported more conflicts in all 3 areas than girls. Conflicts with equals prevailed among youth of the same sex, with the mother, and with female teachers. Girls indicated more internal conflicts than boys. Both sexes mentioned a number of conflicts resulting from their unsuitable actions or behavior. It was found that the lower the ability to adjust, the greater the occurrence of conflicts. No relationship was found between external and internal conflicts, although there was a tendency for internal conflicts to increase with external conflicts. No relationship was found between acceptability and conflict making. (Russian summary)—*English summary.*

4719. Messini, Pietro. (U. Rome, Inst. of Psychiatry, Italy) *Conduite adolescente et équilibre personnel.*

[Adolescent conduct and personal equilibrium.] *Rivista di Psichiatria*, 1970(Mar), Vol. 5(2), 97-115.—Defines adolescent conduct as a dialectic synthesis between thesis and antithesis dependent upon the exigencies of social extrafamilial environment. These 2 poles play a dynamic role in the constitution of 2 types of conduct. Adolescent conduct does not constitute a neurosis, as neurotic conduct entails a revolt accompanied by compulsive passiveness which generates conflict and anxiety. In adolescent conduct, however, 2 types of evolutionary anxiety-producing tendencies occur and are characterized by emotional instability. This instability is reflected in personal identity which is defined as being the general capacity to exercise a social role. The major factor contributing to instability is the simultaneous desire for independence and dependence. The process of integration of adolescent conduct through the formation of significant libidinal identifications is described. (English summary)—*B. A. Stanton*.

4720. Nevel'shtein, V. S. O sotsial'no-psikhologicheskoi issledovanii nekotorykh sotsial'nykh ustremlenii molodëzhi. [On a social-psychological study of some aspirations of youth.] In V. P. Rozhin (Ed.), "Filosofskie i sotsiologicheskie issledovaniya." (See PA, Vol. 45:7193) 87-93.—Over 500 adolescent boys and girls participated in a study of the "moods and frames of mind of student groups," employing a complex of methods: observation, interviews, questionnaires, natural experiment, test situations, etc. Youths were discovered whose outlooks were determined by feelings of dominance or by "romantically heightened or optimistically realistic or prosaically skeptical moods." While the goals of Soviet upbringing are fully represented, contradictions exist which cannot be glossed over—contradictions whose source is essentially the insufficient life experience of the adolescent.—*I. D. London*.

4721. Ondrejko, Peter. (Ministry of Education, Slovakia, Czechoslovakia) Výskum hodnotových orientácií mládeže. [A survey of the appreciation of values by the young.] *Jednotná Škola*, 1969(Apr), Vol. 21(4), 339-347.—Considers the attitudes of the young, their evaluation of realities, and their orientation in the world of values. The roles played by values in the life of man, the standards of value, the types of behavior, and the structure of moral systems are discussed. The link between questions on values and effective methods of acquisition is considered. Emphasis is placed on the needs of depoliticized and passive young people for aid in choosing aims and learning how to act in the present situation. A social research on youth and value orientation project is described which may provide youth with historically true life experience and lead them successfully into social practice. (Russian summary)—*English summary*.

4722. Rehberg, Richard A., Schafer, Walter E., & Sinclair, Judie. (State U. New York, Binghamton) Toward a temporal sequence of adolescent achievement variables. *American Sociological Review*, 1970(Feb), Vol. 35(1), 34-48.—Studied data from 1455 freshmen high school males to evaluate the tenability of 2 causal orderings of adolescent achievement variables. Model I depicts the variables according to the ordering suggested by H. H. Hyman, W. H. Sewell, B. Rosen and others, i.e., adolescent educational expectations are linked with parental socioeconomic status via achievement values (mobility attitudes) and measured intel-

ligence. Model II depicts the variables according to the ordering suggested by R. Turner, i.e., mobility attitudes and measured intelligence are linked with parental socioeconomic status via educational expectations. The criteria for temporal sequence as per the Simon-Blalock correlational procedure render Model II more tenable than Model I. The rhetorical plausibility of Model II and a caveat regarding the testing of temporal inferences from cross-sectional data are discussed. (33 ref.)—*Journal abstract*.

4723. Ruzsnyák, Péter. (Arany János Experimental School, Budapest, Hungary) Az analógiaalkotás gondolkodási műveltségének vizsgálata középiskolába lépő tanulóknál. [Examination of thought based on analogy in students entering secondary school.] *Psichológiai Tanulmányok*, 1968, No. 11, 147-165.—Examined the ability of 14-yr-old students entering secondary school to form analogies using verbal problems. Of the solutions given to the simpler tasks 53% were correct. The majority (31%) of wrong solutions were due to mechanical searching for causal connections. This was attributed primarily to the oneness of teaching methods that stress the "pragmatic" aspects of events. Analysis of 5 other types of mistakes is given. When faced with more abstract tasks both the Ss and 1 other control group did considerably better: 88 and 74%, respectively, gave a correct solution. This is in harmony with Soviet Research on "secondary" abstractions. A great need for a scientifically based series of tasks for assessment, and for carrying out the required improvement is noted. (Russian summary)—*English summary*.

4724. Schludermann, Shirin & Schludermann, Eduard. (U. Manitoba, Winnipeg, Canada) Adolescents' perception of themselves and adults in Hutterite communal society. *Journal of Psychology*, 1971(May), Vol. 78(1), 39-48.—A group of 163 Hutterite 13-15 yr. old boys and girls described on rating scales the following concepts: (a) the average teenager, (b) the average adult, (c) teenagers viewed by adults, and (d) adults viewed by adults. Girls tended to rate all 4 concepts more favorably than boys. The adolescents rated adults more favorably than teenagers. However, Ss rated teenagers more favorably than the expected reputation of teenagers among adults.—*Author abstract*.

ADULTHOOD & OLD AGE

4725. Ahammer, Inge M. (Catholic U., Nijmegen, Netherlands) Actual versus perceived age differences and changes: Young adults and older people view themselves and each other. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 593-594. 30 18 23 yr. old young adults and 30 64-84 yr. old older people were presented with a questionnaire which measured 10 personality dimensions under 3 instructions: self-description, other-perception, and retrospection-prospection. Age differences in the 1st 2 instructions reflected actual and perceived age differences, and the congruence between the 2nd and the 3rd reflected perceived age change. For 5 dimensions, age differences were perceived even though actual differences were obtained in only 2 instances. For no dimension were the perceived age differences seen as a function of age change.—*Author abstract*.

4726. Ehrlich, Ira F. (Washington U.) A study of disengagement and life styles among the aged.

Dissertation Abstracts International, 1971(Jan), Vol. 31(7-A), 3647.

4727. **Granick, Samuel.** (Philadelphia Psychiatric Center, Pa.) **Brief tests and their interrelations as intelligence measures of aged subjects.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 599-600.—Evaluated the intelligence of applicants and residents of a home for the aged by means of the Ammons Full-Range Picture Vocabulary, Raven's Progressive Matrices, and the WAIS. Intercorrelations among the test and subtest scores showed a wide array of correlations, ranging from .37 to .92, and reflecting a probable factorial composition of intelligence which is similar to that of younger adults. The Ammons Information and Vocabulary scores were found to correlate highly (.89 and above) with the Full Scale WAIS. Various combinations of 2 tests also correlated .90 and above with the WAIS, the Ammons and Block Design being highest (.94). Brief type tests are, thus, effective in approximating the results achieved by aged Ss on the WAIS.—*Author abstract.*

4728. **Kaplan, Jerome, et al. (Ed.) Social planning: A continuing challenge.** *Gerontologist*, 1970(Fal), Vol. 10(3, Pt. 1), 189-213.—Presents 6 articles which "have perspectives related to both voluntary effort and government involvement at differing structural points as they affect social planning and the subsequent direct service. From several differing philosophical bases and approaches, these articles relate to local, regional, state, and federal planning. An international flavor is added with an article from England." Beattie, in "The design of supportive environments for the life-span," concludes that "Central to social planning of the physical environment is the development of new conceptual frameworks which may serve as models for continuous experimentation. They may provide fundamental solutions to problems which now abound in our urban centers, including those associated with aging." Stressing the importance of impact research, Cohen calls for new relationships between social gerontologists and governmental program administrators in order to assure sufficient resources for relevant research. The needs of the aging have not been adequately delineated because of bureaucratic and political bargaining, according to Dwight. An effort is being made in Massachusetts to modernize its services. Oriol points out that in social policy priorities the emphasis should be age and youth and not age vs. youth. Schooler, using "a probability sample of 4000 elderly persons, demonstrates how morale is related to environment and social relationships . . . Inferences are drawn regarding the desirability of future research analogous to market research . . ." Inadequacies in local government systems are held responsible for the lack of social development plan and program in Britain.—*I. Linnick.*

4729. **Nuttall, Ronald L., Fozard, James L., Rose, Charles L., & Birney, Spencer.** (Boston Coll., Inst. of Human Sciences) **The ages of a man: Ability age, personality age, and blood chemistry age.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 605-606.—3 functional ages were developed on 1146 25-83 yr. old healthy men. Personality age, using 16 PF data, accounted for 12.7% of variance of CA. Ability age, using General Aptitude Test Battery (GATB) subtests, accounted for 28% and blood chemistry age, in 2 runs each accounted for 12%. The most powerful variables were

GATB Disassemble test, followed by GATB Tool Matching. Next in importance were blood sedimentation rate and phosphorus level. The next most important variables were 16 PF self-sentiment and surgency. All 3 domains acting together accounted for 42% of variation in CA.—*Author abstract.*

4730. **Sheppard, Harold L.** **The potential role of behavioral science in the solution of the "older worker problem."** *American Behavioral Scientist*, 1970(Sep), Vol. 14(1), 71-80.—Reviews statistical data which leads to the conclusion that we "have been drifting into a pattern of labor market behavior that has increasingly negative consequences for the older worker, especially the male older worker." Much of this trend is ascribed "to our national value system that defines retirement . . . as a clear sign of undiluted social progress." Suggested is research in such areas as: changes of job aspirations and motivation of workers as they grow older, the discouragement process experienced by older unemployed workers, and the development of 2nd careers by older workers.—*J. J. Parnicky.*

4731. **Witzke, Donald B., Swartz, Jon D., & Drew, Clifford J. (U. Texas)** **Level of perceptual development of normal adults as measured by the Holtzman Inkblot Technique.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 609-610.—To investigate the relationship between CA of adults and selected scores from the Holtzman Inkblot Technique, 136 normal Ss comprising 4 criterion age groups ranging in age from 20-61 yr. were tested. Each group was composed of identical numbers of males and females matched for CA. Following a statistical correction for number of rejections, a double classification (Age Level \times Sex) analysis of variance revealed significant age-level differences for only 1, but significant sex differences for 5, of the 10 variables studied. These results are interpreted as providing evidence that there is a reversal of perceptual development, as outlined by Werner's organismic-development theory, for women in the middle ages but not for men.—*Author abstract.*

SOCIAL PSYCHOLOGY

4732. **Hall, Elizabeth.** **A conversation with Arthur Koestler.** *Psychology Today*, 1970(Jun), Vol. 4(1), 62-65, 78-84.—Discusses sources of social change (the yogi vs. the commissar), the hunger for meaning possessed by youth which is opposed to the reductionism of the present educational establishment, the use and abuse of language, and the physiological contradictions superimposed in the human brain.—*E. J. Posavac.*

4733. **Luchins, Abraham S. & Luchins, Edith H. (State U. New York, Albany)** **Wertheimer's seminars revisited: Value: I.** Albany, N.Y.: State U. New York, Psychology Dept., 1971.—This report of Wertheimer's interdisciplinary seminars attempts to capture the spirit of class and out-of-class discussions at New School's University in Exile. After an opening session on the role of value in science, the role of the social scientist in shaping society and the pros and cons concerning the scientist's obligation to participate in social action, the following topics are discussed in the context of the national and international, political, social, economic, and moral problems of the 1930s: place of value in science; economics and value; social norms and laws;

philosophical speculations about value; absolute vs. relative ethics; values of youth; the meaning of value terms; studies on value; other discussions on value and evaluation; motives, needs, and values; justice; kindness; moral judgment; studies on fit; conflicts over what fits; doing what is required; and the arbitrariness of laws and roles. Each topic contains reports of experimental outgrowths of the discussion.—*Author abstract.*

4734. Nagy, Lajos. (Hungarian Academy of Sciences, Inst. of Public Law Science, Budapest) *A pszichológus-szakértő közreműködésének lehetőségei a büntető perbell tanúbizonyításnál.* [What the psychologist expert can do with regard to the evidence given by witnesses during criminal trials.] *Pszichológiai Tanulmányok*, 1968, No. 11, 585-605.—Examined possibilities of assessing psychic phenomena bearing on the veracity of a witness on the basis of legislation both in Hungary and other countries, and with reference to applied psychology. In the 1st part of the study, the expert examination in question is in keeping with the explicit legislation of several socialist countries, and it can also be performed on the basis of positive legislation. The 2nd part of the study deals with phenomena to be observed and evaluated in the course of the expert examination. As a psychic process, the process of developing evidence begins the moment the witness learns about the criminally relevant fact and continues to the act of giving evidence in a criminal trial. In this process psychic factors may contribute with objective ones to influence the evidence given. The object of the expert is to reveal these psychic factors and assess their influence on the actual evidence. The expert, however, may not decide on the veracity of the witness. (Russian summary) (26 ref.)—*English summary.*

4735. Pataki, Ferenc. (Hungarian Academy of Sciences, Psychology Inst., Budapest) *A pszichológiában alkalmazott módszerek egyes elvi kérdései és a szociálpszichológiai kutatás.* [Social psychological research and some theoretical problems on methods employed in psychology.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 119-133. Discusses the drawbacks of keeping fundamental scientific and methodic theory strictly apart since methodics may easily lose its connection with the fundamental theoretical-methodological problems of science, and may encourage empiricism. The methodological orientation of psychological trends is closely connected with how these trends interpret the essence and function of the psyche. New data resulting from the rapid expansion of new apparatus in methodics are rendering earlier interpretations in psychological research questionable. Psychology has to make a great effort to meet the requirements of accumulated scientific facts. New possibilities for instrumental examinations, novel apparatus in formalization and model-construction following advances of cybernetics and information theory and the application of experimental method in the study of social behavior mark the main tendencies in a reorganization of psychology. Still the chief problems of development lie on the level of making psychological theories and not on that of methodics. The complicated interaction between theories and methodics can be resolved only if the priority of hypothesis, scientific theory, is kept in the foreground. Research by Hungarian social psychologists is also reviewed and some of the weak points of making hypotheses that concentrate on methodics are disclosed. It is stressed that the phenomena of social psychology

are less tolerant to experimental conditions in the laboratory and that field research is of outstanding importance here. It is suggested that a sharp distinction should be made between the concepts of research method and research technique. (Russian summary)—*English abstract.*

CULTURE & SOCIAL PROCESSES

4736. Atkeson, Paula. *Building communication in intercultural marriage.* *Psychiatry, Washington D.C.*, 1970(Aug), Vol. 33(3), 396-408.—Describes the differences between Filipino and American "child-rearing methods, the cultural definition of childhood, interpersonal relationships, parental and societal expectations, values and goals, self-concepts, and modes of expressing thought and feeling." The counseling of a young Filipino doctor and his wife, an American nurse, is presented as indicative of the types of conflict which may occur in an intercultural marriage and methods of solving the problems. Counseling focused on (a) strengthening and clarifying each partner's identity, (b) development of empathy by an understanding and acceptance of each other's behaviors, and (c) establishment of communication by teaching each to perceive its emotional meaning and intent, without being confused by its form or style. The result was not a compromise or the assimilation of a partner; rather each was able to behave in a manner appropriate to his own culture and still communicate to the other in a need-fulfilling and effective manner (24 ref.)—S. Knapp.

4740. Constantini, Edmond & Craft, Kenneth H. (U. California, Davis) *Competing elites within a political party: A study of Republican leadership.* *Western Political Quarterly*, 1969(Dec), Vol. 22(4), 879-903.

Studied the nature of intraparty cleavage at the leadership level in the 1964 Republican presidential primary clash in California. Data were obtained from a sample of 430 Goldwater, Rockefeller, Nixon and Democratic delegates. On a 14-item questionnaire, Goldwater delegates were consistently more conservative on a broad range of public issues than the Rockefeller delegates. The magnitude of the cleavage on issues was approximately as great as that between the Rockefeller and Democratic groups. The Nixon elite tended to bridge the gap between the 2 Republican groups. The Goldwater elite appeared to be committed and devoted to the Republican party more deeply and over a longer period of time than the Rockefeller elite. The Goldwater elite were more likely to have entered politics as a result of public serving rather than personal serving motives. However, the 2 groups were quite similar in the relative importance ascribed to the various motives underlying political activation. The 2 groups were quite similar in their personality profiles as assessed by scales of the

Gough Adjective Check List and in the way in which these profiles differed from those of the general public. The Goldwater group, however, most clearly expressed these differences.—*Journal summary*.

4741. Distler, Luther S. (U. California, Berkeley) **The adolescent "hippie" and the emergence of a matristic culture.** *Psychiatry, Washington, D.C.*, 1970(Aug), Vol. 33(3), 362-371.—Theorizes that there is more than the usual developmental-generational conflict between parents and their adolescent children, that the conflict is exacerbated by a clash between cultural patterns. From observations of "hippies" and their parents, it was noted that the older generation seemed to be operating on instrumental orientations, while the adolescents were operating on expressive ones. This was further characterized as a change from a patristic culture which values achievement, individual responsibility, goal-directedness, and rationality to a matristic culture which values feelings, intimacy, sensory experiences, and self-exploration. The role of industrialization, technology, women's suffrage, and education in this change is discussed. Implications for working with hippies in a therapeutic setting are noted. An innovative program involving 150-300 high-school-age adolescents in a youth center is described.—*S. Knapp*.

4742. Fabrega, Horacio & Silver, Daniel. (Michigan State U.) **Some social and psychological properties of Zinacanteco shamans.** *Behavioral Science*, 1970(Nov), Vol. 15(6), 471-486.—Compared 20 Zinacanteco shamans to 23 nonshaman members on various social parameters and by means of a projective test. The 2 groups were alike in most respects. Shamans tended to receive lower scores on measures reflecting participation in Ladino culture and higher scores on several psychological dimensions. Findings are evaluated clinically and from a standpoint that accounts for the learning experiences that associate with the shamanistic role. The pertinent literature is reviewed and findings discussed. (31 ref.)—*Journal abstract*.

4743. Graves, Clare W. (Union Coll., Schenectady, N.Y.) **Levels of existence: An open system theory of values.** *Journal of Humanistic Psychology*, 1970(Fal), Vol. 10(2), 131-155.—8 emergent levels of human existence are distinguished: automatic, tribalistic, ego-centric, saintly, materialistic, sociocentric, cognitive, and experientialistic. These arise "as man solves certain hierarchically ordered existential problems crucial to him in his existence." To each state is associated a particular value system, respectively: reactive, traditionalistic, exploitive, sacrificial, materialistic, sociocratic, existential, and experiential. The problem of moral and ethical decline rests "not so much in the breakdown and discard of 'the old' as in the retention of existentially inappropriate values during a period of profound transformation in human existence."—*P. Swartz*.

Perceptual & Motor Skills**, 1969(Dec), Vol. 29(3), 919-921.—It is suggested that the identification of constellations with primitive and classical myths provides clues to culturally important psychological themes. Traces of fertility cults and theological conflicts in the

surviving nomenclature are noted. Detailed analysis by the methods of projective psychology are recommended as a means of uncovering characteristic cultural patterns.—*Journal abstract*.

4746. Kwochka, Vera F. (Columbia U.) **A survey of United States students regarding the effects of their residence in the International House of New York.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3639-3640.

4747. Meissner, W. W. (Massachusetts Mental Health Center, Boston) **Notes toward a theory of values: Values as cultural.** *Journal of Religion & Health*, 1971(Jan), Vol. 10(1), 77-97.—Emerging from this conceptual and exploratory study is the fact that values are a form of symbolic activity that requires the emergence of self-objectivation and identification and the capacity for participating in shared meaning with others. These capacities underlie the development of human personality and establish the possibility of culture. The organization and control of social living in groups depend on man's capacity to form in himself by selection, adaptation, and other formative processes a set of directive and normative principles that constitute standards for his participation in the community. The principles are formed by symbolic processes, based on the integration of instinctual needs, capacities, constitutional givens, defenses, sublimations, repressions, and roles, and assimilate in varying degrees the normative orientation of surrounding value standards that define the limits of acceptable variation. Values are thus integrative forces within the social structure that organize, direct, and control the lines of individual action. (47 ref.)—*Journal summary*.

4748. Powell, Elwin H. (State U. New York, Buffalo) **The design of discord: Studies of anomie: Suicide, urban society, war.** New York, N.Y.: Oxford U. Press, 1970. xvi, 247 p. \$7.50.

4749. Spillerman, Seymour. (U. Wisconsin) **The causes of racial disturbances: A comparison of alternative explanations.** *American Sociological Review*, 1970(Aug), Vol. 35(4), 627-649.—Examines a range of hypotheses of varying specificity in an attempt to account for the location of racial disorders during the 1960s. The general assumptions which must be met by any satisfactory explanation of the distribution of the disorders are considered. Mathematical models are constructed which embody the most prevalent assumptions as to the determinants of community disorder-proneness, and their predictions are compared with empirical data. The specific assumptions considered are: (a) all cities have an identical probability of experiencing a disorder; (b) communities are heterogeneous in their underlying disorder propensities; (c) a process of reinforcement characterizes the occurrence of disorders; and (d) contagion among communities contributes to the distribution of racial disturbances. Only the heterogeneity assumption is supported by the data. The explanatory abilities of several additional theories, each of which assumes the importance of particular community characteristics, are also considered. All are rejected in favor of an explanation which argues that the racial disorders of the 1960s were responses to frustrations which are uniformly felt by Negroes, irrespective of their community situations.—*Journal abstract*.

4750. Tenzel, James H. **Shamanism and concepts of disease in a Mayan Indian community.** *Psychiatry, Washington, D.C.*, 1970(Aug), Vol. 33(3), 372-380.

—Presents “an attempt to review some of the beliefs concerning disease and treatment in a Mayan Indian community in Guatemala. It was initially believed that concepts of disease such as *susto* belonged in the category of mental illness and that therefore shamanistic treatment of this malady represented an indigenous form of psychotherapy. These initial assumptions both proved to be false.” The medical diagnosis of several villagers under treatment by the shaman for forms of *susto* (soul-loss due to fright) revealed serious physical diseases. Anxiety, if present at all, was a consequence of the disease. An analysis of the shaman's curing ceremonies and the cultural importance of his role is presented. Interviews with 4 out of 6 of the village shamans did not support the theory that shamanism is a culturally sanctioned role for psychotics. It is concluded that the shaman's greatest function is the validation and reinforcement of the belief system of the society.—S. Knapp.

4751. Torrance, E. Paul. (U. Georgia) **Human intelligence: The culture-related view.** *Science Teacher*, 1968(Sep), Vol. 35(6), 21-23.—Provides a global summary and several illustrative studies from the literature dealing with cultural influences on intelligence. The impact on the intellectual functioning of children who are reared in disadvantaged environments is highlighted. Studies are cited which show that intellectual level can be positively influenced by placement of children in more stimulating environments during the developmental years. Cross- and subcultural comparisons on intellectual functioning and development, using tests of creative thinking, are presented. (17 ref.)—P. McMillan.

Ethnology

4752. Baron, Rueben M., Heckenmueller, Jerome, & Schultz, Samuel. (Wayne State U.) **Differences in conditionability as a function of race of subject and prior availability of social reinforcer.** *Journal of Personality*, 1971(Mar), Vol. 39(1), 94-111.—A partial replication and extension of Gewirtz' inverse availability paradigm involving both Negro and white college students yielded a number of unexpected effects. The strongest finding was a significant main effect for race, indicating that Negro Ss were more responsive than white Ss to a white examiner's verbal reinforcements. For Negro but not for white Ss there was limited support for Gewirtz' inverse availability hypothesis; Negro Ss in the 12-PA group conditioned more than Negro Ss in the 30-PA group, but this difference was pronounced only for the initial reinforced trials. (27 ref.)—*Journal summary*.

4753. Darnauer, Lyle R. (U. Minnesota) **Social psychology and ethnography: A study of Perindesam.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3636.

4754. Edgerton, Robert B. & Karno, Marvin. (Neuropsychiatric Inst., Los Angeles, Calif.) **Mexican-American bilingualism and the perception of mental illness.** *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 286-290.—Presented a household survey interview to 444 Mexican-Americans and 224 Anglo-Americans on beliefs and perceptions of mental illness. The 2 groups did not differ significantly, but there were significant differences within the Mexican-American group. Ss who completed the interview in Spanish differed from those

who took it in English in beliefs on (a) depression, (b) juvenile delinquency, (c) the inheritance of mental illness, (d) the effectiveness of prayer, and (e) the value of familistic orientation. Results suggest that the more commonly described cultural traits of the Mexican-American are most applicable to those who speak only or mostly Spanish. Findings indicate “the need for mental health professionals who possess both fluency in Spanish and sensitive understanding of the culture of the Mexican-American poor.” (15 ref.)—S. Knapp.

4755. Gruber, Murray L. (Case Western Reserve U.) **Status frustration and social protest among Negro youth.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3648.

4756. Klineberg, Otto. (International Center for Intergroup Relations, Paris, France) **Black and white in international perspective.** *American Psychologist*, 1971(Feb), Vol. 26(2), 119-128.—Surveys areas of conflict on the international scene and concludes that the role of racial differences in most is minor or nonexistent. Recent developments in the United States, e.g., black studies programs, black power, and black nationalism, are outlined. Some research findings which add perspective to approaches to racism are noted: (a) effects of poverty and overcrowding on learning ability; (b) influence of training and exercise on the development of the brain; (c) consequences of teachers' expectations; (d) value of compensatory learning; (e) changes in performance that accompany changes in environment; (f) importance of motivational and other personality factors in determining test performance and educational achievement; (g) the lack of true correspondence between skin color and measure of social disorganization; and (h) the extent to which perception, cognition and thinking are related to social and cultural factors. The responsibilities and tasks of psychologists in combating racism are briefly discussed. (26 ref.)—S. Knapp.

4757. Mack, Delores E. (Howard U.) **Where the black-matriarchy theorists went wrong.** *Psychology Today*, 1971(Jan), Vol. 4(8), 24, 86-87, 80 married couples were selected who were either white or black and low or middle social class. The couples were matched on other variables also. Separately and together the couples completed several questionnaires and behavioral tests designed to tap the distribution of power within the relationship. While there were some social class and task differences, there were no significant differences in the distribution of power attributable to race. The social scientists who refer to Negro matriarchy have not understood that while the sources of power may differ across races, the distribution between the sexes does not.—E. J. Posavac.

Social Structure & Social Role

4758. Gable, Myron. (New York U.) **The value orientations and actual and perceived level of economic understanding of New York businessmen.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3411.

4759. Gibson, John B. (U. Cambridge, England) **Biological aspects of a high socio-economic group: I. IQ, education and social mobility.** *Journal of Biosocial Science*, 1970(Jan), Vol. 2(1), 1-16.—Presents data on the social backgrounds and IQs of a sample of 185 scientists, their male sibs (N = 102), and their

fathers ($N = 116$). The range of IQ in the scientists is similar to the range of scores expected of the higher 25% of a representative general population sample. Scientists' IQs showed a positive correlation with social class. Differences in IQ between the scientists and their fathers in each social class are related to the distance the scientists have moved up the social scale. In the 22 families in which the IQs of the father and 2 male sibs are known, the upwardly mobile sibs tend to have higher IQs than the nonmobile or downwardly mobile sibs. In Class II there is evidence that stabilizing selection operates on IQ to maintain the mean IQ level. The effect on social stratification of such selection, together with increased educational opportunity, is discussed. (22 ref.)—*Journal abstract.*

4760. Jackson, Elton F., Fox, William S., & Crockett, Harry J. (Indiana U.) **Religion and occupational achievement.** *American Sociological Review*, 1970(Feb), Vol. 35(1), 48-63.—Analysis of 1957 national sample data from 766 white male respondents, born in the United States, indicates several religious differences in occupational achievement: (a) Protestants are more likely than Catholics of the same occupational origin to enter high-status nonmanual occupations; (b) Catholics are more likely than Protestants of the same origin to enter low-status nonmanual occupations; and (c) Protestants are more often sharply up-mobile, and Catholics more often down-mobile. These differences are small but are not diminished by controls for ethnicity, region in which reared, age, generation, and size of community in which reared. (41 ref.)—*Journal abstract.*

4761. Robb, J. H. & Cloud, Jonathan. (Victoria U., Wellington, New Zealand) **Occupational mobility in a New Zealand provincial borough.** *Australian & New Zealand Journal of Sociology*, 1970(Apr), Vol. 6(1), 49-51.—To test the mobility vs. inheritance of occupational patterns from father to son, interview data were gathered from a randomly selected sample of 293 fathers in Rotorua, New Zealand. Results showed a downward mobility and little inheritance. It is recommended that such results should be compared with internal migration figures, demographic structure, and occupational opportunities of different types of localities.—*R. W. Brislin.*

4762. Toppen, J. T. (U. Cincinnati) **Underemployment: Economic or psychological?** *Psychological Reports*, 1971(Feb), Vol. 28(1), 111-122.—Briefly reviews economic theories on causes of chronic or recurrent "involuntary" unemployment of the able-bodied. An attempt to systematically test individual psychological characteristics of chronically underemployed persons to assess possible causes is reported. The WAIS and 4 other tests selected for measuring psychopathic tendencies, rather than clinical psychological illness, were given 50 able-bodied chronically underemployed men. Tests were given orally to avoid illiteracy problems. All tests, except 1 which was inconclusive, showed statistically significant differences between the underemployed group and a control group of 50 steadily employed men of similar age, with limited, though somewhat higher educational levels. Greater incidence of aberrant test scores among the underemployed persisted after interaction of uncontrolled variables of race and education were statistically excluded. Underemployed Ss showed lower IQs and more socially maladaptive personality characteristics, suggesting early developing, if not a lifelong psychological handicap. Findings indicate need of consideration of factors, e.g., sources of underemployment in

theoretical and practical approaches to the problem of ref.)—*Journal abstract.*

Religion

4763. Belt-Hallahmi, Benjamin. (U. Michigan) **The rise and fall of the psychology of religion movement.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 722-728.—Briefly reviews the history of the psychology of religion in the United States between 1890 and 1960. Reasons for the growth of interest in the area and the sharp decline that followed, are presented. Reasons for the decline are discussed and it is concluded that inherent theoretical weaknesses made the movement vulnerable both within and without academic psychology, and caused the final decline.—*Author abstract.*

4764. Bloom, Jack H. (Teachers Coll. Columbia U.) **Who become clergymen?** *Journal of Religion & Health*, 1971(Jan), Vol. 10(1), 50-76.—Reviews the literature on the personality dimensions of pulpit clergy and parson seminarians. "With Booth, we are interested in finding out more about the psychological dynamics that allow an individual to maintain mental health in spite of being a cultural deviant." Conflicts of the clergy stressed are 4 factors of emotional distance, love, and sanctuary. It is concluded that "The minister may have learned through his life experience that he cannot be accepted for what he is but for what he does, not what he does for himself but only insofar as he does for others. The anger that results may so endanger his being accepted and his dependence on others that it must be sublimated in some way. What better way to express the anger so that it cannot hurt love and yet at a distance, than by setting oneself apart becoming an exception, a projection and a paradigm of what man should be, and by so doing to serve both God and man well?" It is hypothesized that there is a relationship between personality and vocational choice. "The pulpit is a paradox . . . For some it is a sanctuary in which they can live and be useful. Others find that they have fled into a trap." (70 ref.)—*I. Lamm.*

4765. Brannon, Robert C. (U. Michigan) **Glimpses of old-time racism.** *Psychology Today*, 1970(Apr), Vol. 3(11), 42-44.—Tested the hypothesis that an individual's mental involvement with religion would be more related to racial prejudice than a devotional involvement. A study of 81 members of a congregation that practiced integration and interviews of 43 white residents of a small Southern town supported the hypothesis.—*J. Posavac.*

4766. Glass, Kenneth D. (U. Tennessee) **A study of religious belief and practice as related to anxiety and dogmatism in college women.** *Psychological Abstracts International*, 1971(Jan), Vol. 31(2A), 300-301.

4767. Harris, T. George. **Religion in the age of Aquarius: A conversation with theologian Harvey Cox.** *Psychology Today*, 1970(Apr), Vol. 3(11), 62-67.—Discusses the loss of play and festivity of Western overconcern with objectivity. Strategies to regain this loss are seen in current interest in yoga, drugs, mysticism, Eastern religions, and even voodoo. Religion of the future will emphasize the use of rituals and rituals to aid the expression of the nonrational aspects of the human mind, deemphasizing organization and rational aspects of doctrine.—*E. J. Posavac.*

4768. Houts, Donald C. (Northwestern U.) **The use of ego identity measures in evaluating a seminary**

curriculum. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3356.

4769. **Roback, Milton.** (Michigan State U.) Faith, hope and bigotry. *Psychology Today*, 1970(Apr), Vol. 3(11), 33-37, 58.—A national sample of over 1000 adult Americans was surveyed concerning values, religious practices, and views about race relations. The more frequent the respondent went to church, the less social compassion he expressed. "Considered all together the data suggest a portrait of the religious-minded church goer who has a self-centered preoccupation with saving his own soul and is alienated, rather worldly, and uncoupled with indifference toward—a tacit endorsement of—a social system that would perpetuate social inequality and injustice."—*E. J. Posavac*

4770. **Springstead, Marie T.** (Fordham U.) Problems of postulants and novices in selected communities of religious women. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3356.

4771. **Stark, Rodney, Foster, Bruce D., Gluck, Charles Y., & Quinley, Harold.** Sounds of silence. *Psychology Today*, 1970(Apr), Vol. 3(11), 38-41, 60-61.—A survey of 1580 California clergymen indicated that more than 1/3 have never preached on a pastoral issue. The more traditional the preacher, the less likely it is that he has dealt with social or political issues. Because younger and more liberal clergymen were more heavily represented in the sample, it is likely that the survey overestimates the amount of socially relevant issues mentioned in the pulpit. These data suggest that the church will not become a force for social justice in the foreseeable future.—*E. J. Posavac*

Cross Cultural Comparison

4773. **Henderson, Edmund H., Tang, Barbara H., & Gentsch, Helen.** (U. of Virginia) Self-other orientations of French- and English-Canadian adolescents. *Canadian Journal of Psychology*, 1970(Jun), Vol. 24(1), 142-152.—Compared self-other orientations of 100 French-Canadian and 100 English-Canadian adolescents (ages 12-15) from working class backgrounds. The French-Canadian subjects tended to differ from the English-Canadian subjects on 8 of the 12 measures. French-Canadians were higher in power, low self-esteem, social interest, complexity, and 4 measures of similarity with others. French-Canadians (44 ref.) *Journal abstracts*

4774. **Kikuchi, Akio & Gordon, Leonard V.** (Fukushima U., Japan) Japanese and American personal values: Some cross-cultural findings. *International Journal of Psychology*, 1970, Vol. 5, 181-187.—500 Japanese college students and 467 American college students, from different socioeconomic levels, revealed Japanese to be significantly lower than their American counterparts on Personal Modesty, Achievement and Power, and on the Japanese higher on Obedience and Tradition. However, despite the Nationalism of Japanese Values, significant differences in Nationalism were not found. Japanese and American students from the same socioeconomic levels revealed no significant differences in Nationalism. Orientation is similar for Japanese and Americans

Japanese and Americans. Japanese students are more likely to be obedient and traditional, but Americans are more likely to be achievement oriented and power oriented. Japanese students are more likely to be modest and traditional, but Americans are more likely to be achievement oriented and power oriented. Japanese students are more likely to be obedient and traditional, but Americans are more likely to be achievement oriented and power oriented.

4775. **Shanon, John W.** (University of New York) A comparative study of the satisfaction of American and Mexican operatives. *Journal of Management*, 1970, Vol. 6, 1-10.—A comparative study of the satisfaction of American and Mexican operatives. The study was conducted in a factory in Mexico. The results showed that Mexican operatives were more satisfied than American operatives. The study also found that Mexican operatives were more likely to be obedient and traditional, but Americans are more likely to be achievement oriented and power oriented.

Family

4776. **Holderness, David C.** (University of Illinois) The development of family size desires before marriage: A theory-building study. *Journal of Marriage and the Family*, 1970, Vol. 32, 1-10.

4777. **Berge, Miriam L.** (University of California) Health Jan. 1971. Trial marriage: Harboring the trend constructively. *Archives of General Psychiatry*, Vol. 20(1), 1-10.—A study of the differential variables of the trial marriage concept. The study found that trial marriage would distinguish between committed and non-committed cohabitation in terms of the variables of commitment, stability, and satisfaction. (17 ref.) *Journal abstracts*

4778. **Holderness, Vladimir J.** (University of Missouri) Family femininity and conjugal love. *Journal of Marriage and the Family*, 1970, Vol. 32, 1-10.—A study of the relationship between family femininity and conjugal love. The study found that family femininity was positively related to conjugal love. The study also found that family femininity was related to the variables of commitment, stability, and satisfaction. (17 ref.) *Journal abstracts*

4779. **Kikuchi, Akio & Gordon, Leonard V.** (Fukushima U., Japan) Japanese and American personal values: Some cross-cultural findings. *International Journal of Psychology*, 1970, Vol. 5, 181-187.—500 Japanese college students and 467 American college students, from different socioeconomic levels, revealed Japanese to be significantly lower than their American counterparts on Personal Modesty, Achievement and Power, and on the Japanese higher on Obedience and Tradition. However, despite the Nationalism of Japanese Values, significant differences in Nationalism were not found. Japanese and American students from the same socioeconomic levels revealed no significant differences in Nationalism. Orientation is similar for Japanese and Americans

4779. Karp, Ellen S., Jackson, Julie H., & Lester, David. (Wellesley Coll.) **Ideal-self fulfillment in mate selection: A corollary to the complementary need theory of mate selection.** *Journal of Marriage & the Family*, 1970(May), Vol. 32(2), 269-272.—Proposed that 2 factors operate in mate selection: (a) homogamous trait matching so that a mate will be chosen who resembles the self; and (b) where the actual-self differs from the ideal-self, a mate will be seen as resembling the ideal-self rather than the actual-self. These hypotheses were tested in a sample of 50 engaged girls who rated their actual-self, their ideal-self, and their fiancé's actual-self using an adjective checklist. Both hypotheses are supported.—*Journal abstract.*

4780. Nye, F. Ivan; Carlson, John, & Garrett, Gerald. (Washington State U.) **Family size, interaction, affect and stress.** *Journal of Marriage & the Family*, 1970(May), Vol. 32(2), 216-226.—Synthesizes previous research on the relationship of family size to family relationships and attitudes and reduces the findings to 4 propositions dealing with affect, interaction, and stress. These propositions are submitted to additional tests utilizing secondary data from 2 large surveys. Data support some and question other generalizations of group size obtained from research with laboratory groups. Substantively, families of 3 or 4 children rank lower in all the analyses than families with 1 or 2 children, even with social class constant. Large families with 5 or more children rank lower than 1- or 2-child families in all analyses, but in some analyses they rank higher than families with 3 or 4 children. (24 ref.)—*Journal abstract.*

4781. Reiss, David & Sheriff, W. H. (National Inst. of Mental Health, Bethesda, Md.) **A computer-automated procedure for testing some experiences of family membership.** *Behavioral Science*, 1970(Sep), Vol. 15(5), 431-443.—Reviews a theory of consensual experience, relating family interaction and the thinking and perception of its individual members. From this theory it was hypothesized that members in families who experience the environment in a "consensus-sensitive" way will improve their problem-solving performance as their contact with other members becomes less immediate and intimate. However, members in "environment-sensitive" families will show no change as the immediacy of their contact varies. A computer-automated method for testing this hypothesis is described. It requires family members to solve pattern recognition problems on the basis of positive and negative feedback from a LINC computer and from similar feedback given to other members of the family. The procedure permits systematic control of the immediacy of contact between family members by varying the mode by which the feedback given to 1 member is distributed to the others. (17 ref.)—*Journal abstract.*

4782. Shaver, Phillip; French, John R., & Cobb, Sidney. (U. Michigan) **Birth order of medical students and the occupational ambitions of their parents.** *International Journal of Psychology*, 1970, Vol. 5(3), 197-207.—83 male and 112 female Swedish medical students (approximately 1/2 of those contacted) completed a questionnaire designed to assess home background, motivation, parental encouragement, and parental aspirations toward occupations they had failed to achieve. Results show that (a) medical students were generally 1st-borns, a tendency all the more marked among daughters; (b) the proportion of 1st-borns was

particularly strong among students who related that their fathers had been frustrated in professional ambition; and (c) among males, the oldest to youngest ratio was higher for Ss from rural backgrounds, a finding consistent with a primogeniture assumption. Methodological problems related to volunteering, sample size, mother's age, parental deprivation through death or divorce, and intervening processes may be implicated in the relationships discovered. (French abstract) (22 ref.)—S. E. Gavin.

Social Change & Social Programs

4783. Hahn, Harlan. (U. California, Riverside) **Cops and rioters: Ghetto perceptions of social conflict and control.** *American Behavioral Scientist*, 1970(May), Vol. 13(5-6), 761-779.—Reports results from interviews with residents of the 12th Street neighborhood of Detroit. A great majority of Negro respondents expressed a deep distrust of law enforcement activities. Data reveal that community segments confronting major economic adversity were considered the principal objects of police mistreatment. Attitudes of ghetto residents toward riot control measures were intensely critical. Support was revealed, however, for police strength provided that police imposed strict restraints on their own use of force and that their conduct did not deteriorate during the riots. Further indications for improving police-community relationships are presented, noting that the prognostication in riot areas is not hopeless. (27 ref.)—P. Hertzberg.

4784. Platt, John R. (U. Michigan, Mental Health Research Inst.) **Perception and change: Projections for survival.** Ann Arbor, Mich.: U. Michigan Press, 1970. 178 p. \$7.95.

SEXUAL BEHAVIOR

4785. Athanasiou, Robert; Shaver, Phillip, & Tavis, Carol. (Johns Hopkins U.) **Sex.** *Psychology Today*, 1970(Jul), Vol. 4(2), 37-52. Over 20,000 readers responded to a survey on sexual behavior. The self-selected sample was biased in the liberal direction. For example, most favored loosening of the traditional sexual norms and said that they were "considering" new forms of sexual behavior. Conversely, the respondents were not libertines—they did not report that they engaged in mate-swapping or group sex. Stated religious orientation was strongly related to sexual behavior.—E. J. Posavac.

4786. Basavarajappa, K. G. **A rejoinder to Miss Spencer's comments on pre-marital pregnancies and ex-nuptial births in Australia, 1911-66.** *Australian & New Zealand Journal of Sociology*, 1970(Apr), Vol. 6(1), 79-84.—Discusses issues brought out in K. G. Basavarajappa's (see PA, Vol. 43:12851) article together with the arguments of G. Spencer (see PA, Vol. 45:9816). The basic data were from Australian birth records and from hospital reports. Issues included shotgun vs. anticipatory marriages, explanations based on the greater usage of oral contraceptives, and analyses based on gestation periods and duration of marriages, and moral implications.—R. W. Brislin.

4787. Eysenck, Hans J. (U. London, England) **Introverts, extraverts and sex.** *Psychology Today*, 1971(Jan), Vol. 4(8), 48-51, 82.—Surveys of 6000 German and 800 English students concerning their sexual behavior indicated that, as hypothesized, ex-

troverts were more sexually active than introverts. The results of a factor analysis of the data from the 2nd sample isolated 14 sexual behavior factors. Extroverts, introverts, neurotics, and psychotics scored differently on the factors. The fact that persons being treated for venereal disease were more extroverted than would be expected by chance adds support to the hypothesis.—E. J. Posavac.

4788. Johnson, Ralph E. (Sacramento State Coll., School of Social Work) **Extramarital sexual intercourse: A methodological note.** *Journal of Marriage & the Family*, 1970(May), Vol. 32(2), 279-282.—10 upper middle-class, middle-aged couples residing in a Midwestern community provided meaningful data regarding their extramarital sexual behavior. Data indicate that the incidence of infidelity reported among Ss, when compared with the Kinsey data, was not of significant import. Findings suggest, however, that information pertaining to extramarital coital activity is accessible to the social scientist from representative samples of the population if care and precision is taken in developing the methodological framework.—*Journal abstract.*

4789. Kanin, Eugene J. (Purdue U.) **Sexually aggressive college males.** *Journal of College Student Personnel*, 1971(Mar), Vol. 12(2), 107-110.—Describes incidence, female reactions, pair relationships, erotic history, hostility toward women, general aggressiveness, and adjustive reactions as they relate to sex aggression in college males. About 1/4 of the sample of 341 college females had experienced episodes of male sex aggression. The females involved generally tended to remain secret about the situation either because publicity appears to give attention to the degree of intimacy that she permits, or, she shares the stigma through a guilt-by-association attitude. It was found that aggression was associated to a greater degree with heterogamous pairings. The male aggressive partner tends to view himself as sexually deprived. The male exploitation of the female reflects a more general hostility toward womanhood. Finally, social class and religiosity appear as significant factors comprising the tendency to place fault on the female by the male partner.—R. H. Mueller.

4790. Reiss, Ira L. (U. Minnesota) **Premarital sex as deviant behavior: An application of current approaches to deviance.** *American Sociological Review*, 1970(Feb), Vol. 35(1), 78-87.—Premarital sexual intercourse is viewed as deviant behavior by most parents in our culture and with sufficient intensity to qualify this area for inclusion in the subfield of deviant behavior. 3 basic approaches, (a) labeling, (b) anomie, and (c) social and cultural supports, are examined and the strengths and weaknesses of each and their relevance for various types of deviance are discussed. Suggestions are made for developing a general theory of deviance. (40 ref.)—*Journal abstract.*

4791. Schwartz, Ronald A., Hershenson, David B., & Shipman, William G. (Kendall, Bowers, & Schwartz, White Plains, N.Y.) **The sexual behavior of obese married women.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 445-446. While clinical investigators have generally found that obese people experience less sexual activity than nonobese people, a recent large-scale study found predominant similarity in the incidence and frequency of their premarital and marital sexual behavior. The present study was, in part, a test of the reliability of these findings on a sample of married women only. The results

were confirmatory. However, obese women were found to have a greater desire for marital coitus. It was hypothesized that this is due to their excessive love hunger.—*Author abstract.*

4792. Shanmugam, N. & Wood, C. **Unwed mothers: A study of 100 girls in Melbourne, Victoria.** *Australian & New Zealand Journal of Sociology*, 1970(Apr), Vol. 6(1), 51-55.—To discover the reasons for illegitimate births in Australia, clinical interviews were held with 100 unmarried mothers in a Melbourne hospital. Results included descriptions of Ss' age, occupation, previous sexual experience, knowledge of contraception, relationships with parents, and attitudes toward pregnancy. 3 reasons are suggested that might apply to different individuals, 2 of which deal with family and emotional disturbances.—R. W. Brislin.

Birth Control & Abortion

4793. Stoeckel, John. **Socio-economic status and family planning knowledge, attitudes and practices in rural East Pakistan.** *Social & Economic Studies*, 1970(Jun), Vol. 19(2), 213-225.—Interviewed 80 married women from each of 20 East Pakistani villages on their knowledge, attitudes, and practices of family planning. Socioeconomic status was determined by the husband's occupation, education, and landholding. The variable of age was controlled for the wife. Results indicate that (a) higher occupational and educational status groups had more knowledge of family planning techniques, while the reverse was true for landholding groups; (b) positive attitudes toward family planning were associated with high occupational and low landholding status, and (c) business and skilled occupations had the highest proportions practicing family planning. Amount of education showed the fewest relationships to family planning. Implications for family planning programs are discussed.—S. Knapp.

ATTITUDES & OPINIONS

4794. Alexander, Sue C. (Ohio State U.) **An axiomatic representation of Festinger's theory of cognitive dissonance: An end and a beginning.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3634.

4795. Beswick, David G. (Australian National U., Canberra, Australian Capital Territory) **Attitudes to taking human life.** *Australian & New Zealand Journal of Sociology*, 1970(Oct), Vol. 6(2), 120-130. A survey was undertaken in Canberra, Australia, of attitudes toward taking human life. 2 samples of 213 and 219 adult Ss were employed. An attempt was made to discover a general attitude in opinions on suicide, murder, self-defense, war, mercy killing, capital punishment, and abortion. 2 attitude scales were developed with 2 subscales in each: abortion and mercy killing; and war and capital punishment. The patterns of correlations between opinions, and the distribution of attitudes across various sections of the community, led to the conclusion that at least 2 and probably 4 attitude dimensions were involved.—*Journal summary.*

4796. Bodaken, Edward M. (Michigan State U.) **Choice and perceived audience attitude as determinants of cognitive dissonance and subsequent attitude change following counterattitudinal advo-**

cacy. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3634-3635.

4797. Dohrenwend, Barbara S. (City Coll., City U. New York) **An experimental study of payments to respondents.** *Public Opinion Quarterly*, 1970-1971(Win), Vol. 34(4), 621-624.—Respondents were offered a \$5 honorarium (for themselves or a favored charity), to participate in a survey. Results "clearly indicate, however, that to improve completion rates in general population surveys we should put our money elsewhere."—A. R. Howard.

4798. Einhorn, Hillel J. & Gonedes, Nicholas J. (U. Chicago, Graduate School of Business) **An exponential discrepancy model for attitude evaluation.** *Behavioral Science*, 1971(Mar), Vol. 16(2), 152-157.—Presents a model based on an exponential decay function to deal with evaluation based on discrepancy. This evaluation concerns discrepancy based on attitudes and specifically hypothesizes that as discrepancy from one's ideal point increases, evaluation of a multidimensional stimulus object will decrease. The model was successfully applied to experimental data dealing with the evaluation of political candidates by 107 undergraduates. The parameters of the model are shown to be related to the intensity of an attitude. Results are interpreted in terms of latitudes of acceptance, rejection, and noncommitment. (18 ref.)—*Journal abstract*.

4799. Häfner, Heinz. **Vorurteile der Öffentlichkeit gegenüber psychisch Kranken.** [Prejudices of the public against the mentally ill.] *Gruppendynamik*, 1970(Feb), No.1, 70-73.—Prejudices and the negative attitude of society hinder timely recognition of crises and illnesses, early and adequate treatment of mentally ill, readjustment to community life, and cause recurrences of illnesses. Prejudices as sociopsychological phenomena can be increased or decreased by a social learning process in some individuals but require personality change in others. Unfavorable information about mental illness still circulates among the population stemming frequently from press sensationalism. In addition, locked wards, and methods of commitment contribute to fantasies about the mentally ill. Remedies are: raising the general level of understanding human problems and attacking the problem of mental health from the standpoint of human relationships. Mass media and particularly individual communication can help in the enlightenment process.—M. J. Stanford.

4800. Larimer, George S. (U. Portland) **Indirect assessment of intercultural prejudices.** *International Journal of Psychology*, 1970, Vol. 5(3), 189-195.—2 groups consisting of 64 French (Acadian and Quebec) collegiate Ss and 2 groups of 64 English (New Brunswick and Montreal) Canadians heard a description of a landscape read both in French and in English. 6 French (2 each of Parisian, Quebec, and Acadian) and 6 English (2 each of Oxford, Canadian, and Eastern United States) accents read the descriptions, randomly presented to Ss. Ss were informed that the study purported to determine how accurately people can judge personality characteristics from voice. Orthogonal comparisons support the conclusion that French Canadians have internalized the prejudiced status they appear to hold in Canada. The Quebec accent received ratings significantly lower than the Acadian, Canadian, and Oxford accents, and ratings equal to American and Parisian accents. All samples rated the Quebec male significantly lower than other accents. Results support use of indirect techniques of

attitude assessment as revealing subtle relations that exist between 2 contending groups. (French abstract)—S. E. Gavin.

4801. Linsky, Arnold S. (U. New Hampshire) **Theories of behavior and the image of the alcoholic in popular magazines, 1960-1966.** *Public Opinion Quarterly*, 1970-1971(Win), Vol. 34(4), 573-581.—Finds a pattern which partly reflects "cultural changes in popular conceptions of man's nature and social relationships which go far beyond the problems of alcohol, and which affect views of both normal and abnormal behavior." It appears that current views of alcoholism derive less from scientific data than from social and philosophical views.—A. R. Howard.

4802. Orpen, Christopher. (U. Cape Town, South Africa) **The relationship between extraversion and tough-mindedness in a "tough-minded" culture.** *Journal of Psychology*, 1971(May), Vol. 78(1), 27-29.—Tested the hypothesis that social attitudes are not closely related to deep-lying personality trends in cases where the social attitudes are culturally sanctioned. 90 Afrikaans-speaking South African schoolchildren brought up in the relatively "tough-minded" Afrikaans cultural climate were given measures of tender-mindedness, extroversion, and social distance. Ss were given the Eysenck Personality Inventory, Eysenck's Tender-Mindedness scale, and the Bogardus social distance scale. The correlation between the personality dimension of extroversion and tender-minded attitudes was negligible, supporting the hypothesis. This major finding and others are discussed in terms of the cultural determination of the relationship between extroversion and tough-minded attitudes.—*Author abstract*.

4803. Popper, Péter. (Medical U. Budapest, Children's Clinic, Hungary) **Az Interperszonális kapcsolatok sémáinak új vizsgálati módszere.** [Experimental method for examining patterns of interpersonal relations.] *Pszichológiai Tanulmányok*, 1968, No. 11, 643-655.—Examined attitudes towards 5 basic forms of interpersonal relations: solitary situation, dyadic situation, a group of 3, structured small group, and crowd situation. The accepting or rejecting attitude toward these forms of contact are embedded in 4 actual life situations chosen to suit the purpose of the test: leisure, work, spending some time on a deserted island, and illness involving life in a hospital ward. These situations constitute complementary opposites in more than 1 respect. The 4 life situations were exposed to the Ss as 4 givens, and the 5 basic interpersonal contact forms were enumerated. The evaluation of the Ss was obtained by asking which of the interpersonal contact forms would enable him to accept the given life situation and in which of the forms would he reject it. In his response, the S qualified his choice with the evaluative statements "with great pleasure," "willingly," "doesn't make a difference," "not very keen on," or "wouldn't like to." The configurations obtained were graphically represented and based on a specific sign system expressed mathematically for evaluation. It was found that triads represent the basic infantile situation (father-mother-child), while structured small groups correspond to the wider family milieu, the personal environment. Tasks and plans involved by the complete elaboration of the method are outlined. (Russian summary)—*English summary*.

4804. Simon, Rita J. (U. Illinois) **Use of the semantic differential in research on the jury.** *Jour*

nalism Quarterly, 1968(Win), Vol. 45(4), 670-676.—Reports results of the use of the semantic differential to assess the reaction of jurors to a defendant accused of incest in a criminal trial. Ss were 45, 12-person "juries" who heard a recorded trial based on a real case. After the trial and before deliberation each juror indicated whether he thought the defendant guilty or not guilty by reason of insanity. Semantic differential scales were also administered. After deliberation a final questionnaire was completed. Deliberation reduced the guilty verdict jurors' image of the defendant's potency and increased their negative evaluation of him. There was practically no effect on the not guilty verdict jurors. These divergent perceptions are explained by suggesting differences in the psyche of guilty and not guilty verdict jurors.—J. A. Kline

Formation & Change

4805. Anderson, Norman H. (U. California, San Diego) **Integration theory and attitude change.** *Psychological Review*, 1971(May), Vol. 78(3), 171-206.—Applies a theory of information integration to attitudes and social judgments, based on a principle of information integration. Exact tests based on analysis of variance are given for 4 applications of a simple but general algebraic model of judgment, and these applications are reconsidered under the further restriction imposed by the averaging hypothesis. Qualitative comparisons are made to several other theories of attitude change. Molar and molecular analyses of communication structure are considered briefly and the analysis of inconsistency resolution within integration theory is discussed. It is concluded that integration theory has had reasonable success in the areas of learning, perception, judgment, decision making, and personality impressions, as well as attitude change. It may thus provide a beginning to a unified general theory. (6 p. ref.) *Journal abstract*

4806. Dean, Robert B., Austin, John A., & Watts, William A. (U. California, Berkeley) **Forewarning effects in persuasion: Field and classroom experiments.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 210-221.—Examined the effects of forewarning of persuasive intent upon opinion change. Exp. I, a field study with 42 males and 46 females, used forewarning vs. no forewarning, high- vs. low-involvement issues, and high- vs. low-status message sources. The high involvement message produced a boomerang effect, while the low-involvement message changed opinion substantially in the advocated direction. Both the main effect of issue and of forewarning were significant, with the forewarned conditions producing less opinion change, regardless of issue involvement or source status. Exp. II, conducted in the classroom with 79 male and 82 female undergraduates, examined the effects of forewarning with involving and uninvolved issues, in addition to testing the effect of sex and item-ordering, where Ss either 1st answered opinion items for the issue read and then for the other issue (normal order), or the reverse. The high-involvement issue resulted in little opinion change in any condition. For the low-involvement issue, a significant 3-way interaction was obtained, such that in the normal item-ordering conditions, forewarning inhibited opinion change for males but facilitated change for females, while in the reverse ordering condition, neither variable made any difference. Results are discussed in terms of

their degree of support for the hypotheses advanced by both R. Apsler and D. O. Sears (see PA Vol. 42:12020) and D. Papageorgis (see PA, Vol. 43:782). (32 ref.) *—Journal abstract.*

4807. Feher, Bela A. (Wayne State U.) **Perception of social influence: Keiman's processes of social influence and the attribution of attitude.** *Dissertation Abstracts International*, 1971(Jan) Vol. 31(3-A), 3627.

4808. Harvey, John & Mills, Judson. (U. Missouri) **Effect of a difficult opportunity to revoke a counter-attitudinal action upon attitude change.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 201-209.—Tested the hypothesis that giving a person a difficult opportunity to revoke a discrepant action will increase attitude change in the direction of consistency with the action. 59 undergraduate males completed a questionnaire on reactions to college issues. 40 Ss were induced to record a speech arguing for a position discrepant with their prior attitudes. In confirmation of the hypothesis, Ss given an opportunity to record a substitute speech at an inconvenient time and place changed their attitudes more toward consistency with the action than those not given the opportunity. The effect of the opportunity to revoke the action was greatest for Ss whose prior attitudes were most discrepant. An attempt to manipulate directly the salience of the discrepancy between the action and prior attitudes was unsuccessful (16 ref.) *Journal abstract*

4809. Johnson, David W. (U. Minnesota) **Effectiveness of role reversal: Actor or listener.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 275-282. Studied attitude change in 51 undergraduates and compared the initial effect of engaging in role reversal with listening to one's adversary reverse roles, and engaging in self-presentation without reversing roles. The most attitude change was found in the actor condition and the least took place in the listener condition. Results support the attitude-change explanation of the efficacy of role reversal and indicate that the initial effect of listening to one's adversary reverse roles is to reinforce one's attitudes about the issue being negotiated. (18 ref.) *—Journal abstract.*

4810. Kline, John A. (U. Missouri) **Interaction of evidence and readers' intelligence on the effects of short messages.** *Quarterly Journal of Speech*, 1969(Dec), Vol. 55(4), 407-413. For high school students reading short messages from unidentified sources. (a) Specific factual evidence is more effective than either nonspecific factual evidence or no factual evidence in producing opinion change and heightening the perception of the expertness and trustworthiness of the source. Nonspecific evidence is somewhat, though not consistently, more effective than no evidence. Typical evidence has little effect on the confidence with which these readers of persuasive messages hold their opinions. (b) The effect of type of evidence varies as a positive function of receivers' intelligence. The existence of factual evidence and the specificity of evidence makes more difference for receivers of high intelligence than low-intelligence receivers. This difference is sharpest when the effect sought is opinion change or perceived expertness of source. *—Journal summary.*

4811. Rohanschky, Mihály. (Hungarian Academy of Sciences, Psychology Inst. Budapest) **A vélemény-változtatás pszichológiai vizsgálatának néhány módszere.** [Methods for the psychological examination of change in opinion.] *Psichológiai Tanulmányok*, 1970,

Vol. 12, 165-177.—Reports on methods and procedures of a longitudinal study of the effectiveness of communication and persuasion. The study is concerned with opinion research that plans to survey, with the use of concrete questions, opinions held by determined groups or group members. After a description of the method aimed at finding the opinion level, procedures to obtain a change in opinion are described. Verbal communication and film effect as well as the method for assessing their influence are discussed. The method of group discussion and the role of expert opinion in persuasion are analyzed. Complementary and control examinations needed to ensure exact data are also included. (Russian summary) (33 ref.)—*English summary*.

4812. Rohánszky, Mihály. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **Acsopontos vita és a szakértői vélemény szerepe a vélemény alakulásában.** [The role of group discussion and expert opinion in the formation of opinion.] *Pszichológiai Tanulmányok*, 1968, No. 11, 97-110.—Described studies of the psychological laws and effect-mechanisms of declaring and changing one's opinion. The question of what should be done with the child that lives in endangered circumstances was considered. Ss were shown a conflict situation in a film and then asked to solve it by giving their opinion. This was followed by group discussion and hearing an expert opinion. The role of the latter factors in influencing changes of opinion was assessed. The preparatory and maturing influence of group discussion and the influence of the expert's report in lending authenticity are noted. In contradiction with views that change in opinion is due solely to conformism, it is shown that the acceptance of the new opinion is not a mechanical process. It involves utilizing the old view and adjusting it to the new, by giving an "internal explanation" for the change. (Russian summary) (16 ref.)—*English summary*.

4813. Sawyers, Barbara K. & Anderson, Norman H. (U. California, San Diego) **Test of integration theory in attitude change.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 230-233.—Tested a linear integration model for attitude change in an experiment on judgments of United States Presidents. 72 undergraduates received paragraphs describing the actions and achievements of various United States Presidents and rated them on statesmanship. Data generally support the parallelism prediction of the model, although 1 significant discrepancy was found. Order of presentation yielded a small nonsignificant primacy effect.—*Journal abstract*.

Influence & Behavior

4814. Kidder, Louise & Brickman, Philip. (Northwestern U.) **When directness is the better part of valor: Effects of normative and informational pressure on direct and indirect attitude tests.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 238-246.—Tested the hypothesis that while indirect tests might be less vulnerable to normative pressure, they would be more vulnerable to informational pressure. 71 ROTC and 60 non-ROTC students took either a direct opinion test of their attitudes toward ROTC or a knowledge test, designed to assess attitudes toward ROTC indirectly. The opinion test proved relatively invulnerable to both normative and informational pressures, while the knowledge test was affected by both.

On the knowledge test, conformity was increased by normative pressure (public responding), while on the opinion test, conformity was decreased by public responding. It is suggested that in their effort to purchase immunity from self-report biases, indirect tests necessarily assume an ambiguity that allows situational factors to influence responding, while direct tests are structured in such a way as to induce Ss to resist active attempts to influence them. (27 ref.)—*Journal abstract*.

4815. Kramer, Gerald H. (Yale U.) **The effects of precinct-level canvassing on voter behavior.** *Public Opinion Quarterly*, 1970-1971(Win), Vol. 34(4), 560-572.—Analysis of 4 Survey Research Center (University of Michigan) election surveys suggests that "the primary effect of door-to-door canvassing during a presidential campaign is to increase turnout; there is little effect on voter preferences for national or local offices." A detailed description of the statistical model underlying this study is included.—A. R. Howard.

4816. Kutschinsky, Berl. (U. Copenhagen, Denmark) **Det strider mod den almindelige retsbevidsthed!** [It is contrary to the public sentiment of justice!] *Nordisk Psykologi*, 1969, Vol. 21(3), 173-176.—Neither formally nor in reality does "the public sentiment of justice" conceived as the opinions of "the population-mean" have any direct influence on legislation or legal usage. The prerequisite for an influence should be systematic investigations but these are virtually nonexistent in relation to the legal system. A more indirect influence from "the people" operates through various channels but there is much "noise" in the channels between people at large and the court officials.—P. Mylov.

4817. Miller, F. T., Bentz, W. K., & Aponte, J. F. (U. North Carolina, Chapel Hill) **Stress-sensitive groups in a rural population.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 731-732.—Focuses on the development of a methodology for defining groups in communities on the basis of their sensitivity to environmental events impinging on their community. 100 newspaper headlines covering national, state, and local events over a 2-mo period were presented to a random sample drawn from a rural county. Ss rated the events on a 5-point scale from stressful (1) to reassuring (5). Factor analysis yielded 7 groupings of individuals. Each group is discussed on the basis of the events and demographic characteristics serving as definers.—*Author abstract*.

4818. Sigall, Harold & Page, Richard. (U. Rochester) **Current stereotypes: A little fading, a little taking.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 247-255.—Examined the possibility that social-desirability-tainted responses emerge in the study of stereotypes. 60 white male undergraduates were randomly assigned to 1 of 4 experimental conditions. Ss were asked to indicate how characteristic each of 22 adjective traits was of either "Americans" or "Negroes." 1/2 the Ss responded in a rating situation in which they were presumably free to distort their responses. The remaining Ss responded under "bogus pipeline" conditions; i.e., they were led to believe that the experimenter had an accurate, distortion-free physiological measure of their attitudes, and were asked to predict the measure. Results support the expectation that the stereotype ascribed to Negroes would be more favorable under rating than under bogus pipeline conditions. Americans were more favorably stereotyped under bogus pipeline than under rating conditions. A number of

explanations for these results are discussed, and consideration is given to the relationship between verbally expressed attitudes and other, overt, behavior.—*Journal abstract*

GROUP & INTERPERSONAL PROCESSES

4819. Anderson, John R. (Case Western Reserve U.) A study of awareness, purpose, and response in dyadic social interaction. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3634.

4820. Argyris, Chris. Die Zukunft des gruppendynamischen Laboratoriums. [Future of laboratory in group dynamics.] *Gruppendynamik*, 1970(Feb), No.1, 20-40.—Discusses human needs for self-acceptance, self-esteem, and their furtherance and satisfaction through group interactions which become testing grounds for personal growth through learning. Examination of the present form of these seminars shows focus upon 1 or 2 goals in learning, initial passivity of leader, significance of here-and-now situations, giving and receiving feedback, and transference of laboratory arrangements upon outside situations. Discussions on present trends mention minimal theoretical foundations, impatience of advocates to let participants verbalize feelings, and assumption of responsibility of leaders for group process. Consequences upon group behavior and influence upon personality of participants are pointed out together with concern about great dependence upon leader and stress upon emotional involvement with forgetting cognitive elements.—*M. J. Stanford*.

4821. Blake, Robert R. & Mouton, Jane S. (Scientific Methods, Incorp., Austin, Tex.) The fifth achievement. *Journal of Applied Behavioral Science*, 1970(Oct), Vol. 6(4), 413-426.—Recognizing man's 4 achievements in dealing with differences among men, i.e., science, politics, hierarchy, and law, a 5th achievement by which men will ultimately be able to work out their differences in a forseen. It will be the establishment of a problem-solving society in which its members can resolve differences through their own insight. A conflict grid is presented for use in evaluating good or bad ways for ending disputes as a vehicle for creative problem-solving in the future and a basis for such a problem-solving society.—*Journal abstract*.

4822. Brown, Racine D. (Washington U.) Emotional expression. Interpersonal attraction, and rejection of a deviate. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3635.

4823. Cartwright, Dorwin & Harary, Frank. (U. Michigan, Research Center for Group Dynamics) Ambivalence and indifference in generalizations of structural balance. *Behavioral Science*, 1970(Nov), Vol. 15(6), 497-513. Proposes that the theory of networks constitutes a more suitable conceptualization than signed dygraphs in treating the structural properties of configurations of evaluative relationships, since it places no restriction on the values assigned to lines. The use of networks for this purpose requires that an appropriate system of values be formulated. The properties of several possible value systems are examined critically, and the diamond and triangle models are judged most promising. Both are based on the assumption that in order to state the value of a relationship it is necessary to specify 2 components, a positive and a negative one. It is shown that these 2 systems are generalizations of symbolic psychology and of conceptualizations of structural

balance stated in terms of signed dygraphs. Cycle, path, and partition balance are defined and the empirical implications of each are examined. Suggestions are made concerning the construction of quantitative indexes for balanced and imbalanced structures. (19 ref.)—*Journal abstract*

4824. Centers, Richard & Granville, Arthur C. (U. California, Los Angeles) Reciprocal need gratification in intersexual attraction: A test of the hypotheses of Schutz and Winch. *Journal of Personality*, 1971(Mar), Vol. 39(1), 26-43.—For the group of most intimate dyads (married) 12 tests of Winch's hypotheses resulted in 4 corroborations, while for Schutz' hypotheses the ratio was 4:7. Overall, 18 of 24 cases significantly contradicted predictions from Winch's hypothesis, while no tests of the Schutz hypotheses were significant in a direction opposite to the one predicted.—*Journal summary*.

4825. Culver, Charles M. & Dunham, Frances. (Dartmouth Coll., Medical School) Human relations training with complementary social groups. An experiment in face-to-face interaction. *Psychiatry*, Washington, D.C., 1970(Aug), Vol. 33(3), 344-351.—Presents data from workshops with 2 groups of community service workers and welfare recipients and 1 group of probationary officers and young probationers. Groups were typically composed of 8-15 members and 2 leaders. Progress in unstructured T groups generally followed a pattern of (a) stereotyped reactions, (b) conflict of leadership, (c) group crisis with breakdown of roles, and (d) interpersonal rather than role-defined relations. Other activities, e.g., lectures, group observation, skill groups, and recreational activities, were used to organize participants in cooperative and competitive groups that cut across role axes. Staff problems are noted. The usefulness of this training method for the social groups who continue to play complementary interdependent roles is discussed. *S. K.*

4826. Denner, Bruce. (Pennsylvania State U., Coll. of Human Development, Div. of Community Development) Refusal to communicate. Preliminary study of a classical interpersonal tactic. *Perception & Motor Skills*, 1969(Dec), Vol. 29(3), 835-842. To determine the manner in which a person, confronted by another handles another not communicated, a sample of 16 female undergraduates each were confronted by either another silent female, a smiling, or a talking female. A control group sat alone for the same 10-min period. Sex was indicated whether they were inwardly or outwardly perceptually oriented. Ss exhibited more gross body movements, eye contacts, and postures, and rated themselves more outwardly oriented in the talking than in the silent condition; the smiling condition fell in between. Contson calculated even more and rated themselves even more outwardly oriented than Ss in the talking condition. Results can be analyzed in terms of anxiety, non-playing competence, and the nonverbal nature of a 2-person interaction.—*Journal summary*.

4827. Deutsch, Morton, Canavan, Dennis & Rubin, Jeffery. (University of California) The effects of size of conflict and sex of experimenter upon interpersonal bargaining. *Journal of Experimental Social Psychology*, 1970(Mar), Vol. 6(1), 25-37. Investigated the effects of 2 variables upon interpersonal bargaining. The experimenter was either male or female, varied, ran the size of the conflict confronting the Ss (manipulated by varying the length of a 3-line path through which both Ss of a pair had to pass in order to

reach their destinations); and (b) the sex of the experimenter ($\frac{1}{2}$ the Ss were run by a male and the other $\frac{1}{2}$ by a female). Measures such as mean joint payoff, frequency of maximum losses, and frequency of mutually positive outcomes indicate that as conflict size increased, bargainers had more difficulty in reaching a mutually beneficial solution. Also, male Ss run by a female E were more competitive than those run by a male E.—*Journal abstract*.

4828. Druckman, Daniel. (Inst. for Juvenile Research, Chicago, Ill.) **On the effects of group representation.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 273-274.—Reports that N. Vidmar's recent attempt to reconcile his findings on the effects of group representation with a contradictory finding from an earlier experiment by D. Druckman (see PA, Vol. 41:11852) is based on a misunderstanding of the procedures used in the earlier experiment. On the basis of a careful examination of the procedures used in both experiments to create "group-representing" and "self-representing" conditions, it is concluded that the results of neither experiment indicate, unambiguously, that representation per se exerts a significant influence on negotiation behavior.—*Journal abstract*.

4831. Filloux, Jean C. **Pédagogie et groupe.** [Education and groups.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(6-8), 428-439.—Presents a syllabus for a seminar in group processes.—R. E. Smith.

4832. Foa, Uriel G., Mitchell, Terence R., & Fiedler, Fred E. (U. Missouri) **Differentiation matching.** *Behavioral Science*, 1971(Mar), Vol. 16(2), 130-142.—Proposes that an individual will be more effective in his adjustive and task-related functions when the degree to which he distinguishes among elements of his environment or other people matches the differentiation found in the environment or in the other people. Differentiation matching is discussed in 3 settings: (a) matching of the group leader's cognition to the task situation, (b) communication among members of different cultures, and (c) a comparison of the interpersonal cognitive structures of mental patients and normal individuals. The effects of differentiation matching are related to problems of cognitive development, its cultural diversities, and its pathology. (35 ref.)—*Journal abstract*.

4833. Franklin, Billy J. (U. Iowa) **Attitude similarity-dissimilarity, dogmatism, and interpersonal attraction.** *Psychology*, 1971(Feb), Vol. 8(1), 4-11.—Tested 2 hypotheses from Rokeach's theory of cognitive structuring: (a) dogmatism will produce a main effect on interpersonal attraction, and (b) dogmatism will interact with attitude similarity to produce an effect on interpersonal attraction. Data were secured from 120 undergraduates in a 3×4 factorial design. Ss were selected as high, medium, and low dogmatics according to their scores on Form E of the Dogmatism Scale. The "hypothetical stranger" procedure was used to elicit attraction ratings. The data reveal a significant effect of attitude similarity on attraction, but neither of Rokeach's propositions receive support. It is suggested that perhaps

these findings are a function of the use of the "hypothetical stranger" procedure. An altered replication using an S-other interaction design is proposed.—J. A. Blazer.

4834. Friedlander, Frank. (Case Western Reserve U.) **The primacy of trust as a facilitator of further group accomplishment.** *Journal of Applied Behavioral Science*, 1970(Oct), Vol. 6(4), 387-400.—Reports on a longitudinal study which explores the relationship between the early formation of trust and further group accomplishments. Early measures of trust formation were related to several dimensions of group development and behavior. 12 task oriented work groups, 4 of which participated in organizational training laboratories and 8 which did not, constituted the groups under study. Results indicate that prelaboratory trust is a key predictor of eventual group accomplishment ($r = .60$), although trust itself did not increase as a result of an isolated laboratory training experience. As a function of training, trainees post-laboratory concept of trust merged with their concept of an effective group and an effective group meeting. The meaning of these results in terms of consultative intervention is discussed.—*Journal abstract*.

4836. Haley, Hugh J. & Rule, Brendan G. (U. Alberta, Edmonton, Canada) **Group composition effects of risk taking.** *Journal of Personality*, 1971(Mar), Vol. 39(1), 150-161.—Variability and extreme bias were systematically varied in groups of 3 moderate risk takers, who varied in unanimity on a critical item. The probability preference of each member was then reassessed. Frequency of each member's initiation of conversation was also measured. Moderate risk takers shifted toward the high risk takers but away from low risk takers, so that they increased in risk under both extreme bias conditions. Groups with greater unanimity in initial risk increased in risk more than those with less unanimity. Low risk takers moved toward the moderate Ss more than did the high risk takers, thereby increasing more in risk. Both extremely high and low risk takers changed more toward the unanimous moderate groups, with high risk takers increasing in risk the most. (15 ref.)—*Journal summary*.

4837. Harvey, Jerry B., Oshry, Barry I., & Watson, Goodwin. (National Training Lab. Inst. for Applied Behavioral Science) **A design for a laboratory exploring issues of organization.** *Journal of Applied Behavioral Science*, 1970(Oct), Vol. 6(4), 401-411. Describes the design of a laboratory dealing with issues of organization. It differs from traditional sensitivity training designs in that it consists of a theoretical model rather than a sequence of staff-designed activities. The model, in a form of a series of learning assumptions, is explicated. Staff anxiety was 1 of the basic problems in carrying out the design. Results of its application to a particular laboratory program are discussed. A variety of issues arising from this kind of design are also described. Key variables affecting the success of the design are discussed.—*Journal abstract*.

4838. Haslam, William B. (Brigham Young U.) **The effect of apparent reward on behavior in certain problem-solving groups.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3638.

4839. Hendrick, Clyde & Hawkins, Gayle. (Kent State U.) **Race and belief similarity as determinants of**

attraction. *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 710.—Assesses the effects of varying race, similarity, and type of stimulus questionnaire on interpersonal attraction, using 42 white male undergraduates in 2 different sessions: (a) the completion of 3 questionnaires on background, attitudes, and a forced-choice Behavioral Preferences scale; and (b) the evaluation of 4 strangers of an "Interpersonal Prediction Form." Results show a basic effect similarity-attraction result. A Race \times Similarity interaction also occurred, suggesting that similarity is not always the preferred state.—P. Hertzberg.

4840. Hunyady, György. (Hungarian Academy of Sciences, Psychology Inst., Budapest) **A szociometriai módszer és az interperszonális viszony.** [Interpersonal relation and sociometric method.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 135-149.—States that with the sociometric method interpersonal relationships are examined and characterized as the emotional relations of companions. It is also noted that there are other characteristics of an interpersonal relation, i.e., (a) intensity of reciprocal emotions, including also indifference; (b) perception of the companion; (c) object-bound common activity organizing in a relatively autonomous form; and (d) identity and difference of companions with regard to exterior and interior, objective and psychological conditions of common activity. An interpersonal relation is considered to be a relation of production. The relations of being attached to somebody, of status, influence, interaction, role, etc., used as abstractions in social psychology, are the various aspects of the same concrete interpersonal relation and can therefore be studied in their interconnections. The sociometric method highlights only 1 side of an interpersonal relation, while the others can be investigated with other methods. The application of the category of interpersonal relation has proved extremely useful for the systematization of research methods and data. (Russian summary) (29 ref.)—English abstract.

4841. Kahn, Michael H. & Rudestam, Kjell E. (Miami U.) **The relationship between liking and perceived self-disclosure in small groups.** *Journal of Psychology*, 1971(May), Vol. 78(1), 81-85.—Self-disclosure has been found to be an important variable in developing and maintaining interpersonal relationships. Liking and perceived self-disclosure were measured by means of a ranking system in the context of an ongoing encounter group. Ss were 10 clinical psychology graduate students and the group leader was a faculty member of a psychology department. Results demonstrate that the median correlation between the degree of liking a member and the amount of his self-disclosure is consistently high and positive ($p < .05$). There was some indication, however, that self-disclosure serves a more prominent role in the early stages of group functioning. Author abstract.

4842. Lerner, Richard M., Solomon, Henry, & Brody, Sherl. (Eastern Michigan U.) **Helping behavior at a busstop.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 200.—In a field situation, 30 Ss, bystanders in groups ranging from 2-4 persons, had the opportunity of helping a lost person by giving directions and/or money for carfare. Although a significant majority of the Ss helped in some way, the probability of helping did not decrease with increased group size. Results are compared with those of some other studies of helping behavior. It is concluded that present data warrant a reconceptualiza-

tion of the contextual controls presently used in laboratory social psychological research.—Author abstract.

4843. Lück, Helmut E. **Einige Determinanten und Dimensionen des Führungsverhaltens.** [Some determinants and dimensions in leader behavior.] *Gruppendynamik*, 1970(Feb), No. 1, 63-69.—Hemphill's questionnaire in his previous research on relationship between group size and leader role, translated into German, was used with 132 students. There was no relationship between group size and individual and group judgments about the leader but agreement existed between individual and group judgments with the former ones being more critical. Even without direct confirmation of Hemphill's results, tendencies pointed to stronger leader role and structure in larger groups. Leaders of larger sized groups were less flexible and more concerned with the group than with individuals. Factor analysis extracted factors similar to "locomotion" and "cohesion" functions of leaders which also agreed with Fleishman's "initiating structure" and "consideration." (20 ref.)—M. J. Stanford.

4844. Mettec, David R. (Yale U.) **Changes in liking as a function of the magnitude and affect of sequential evaluations.** *Journal of Experimental Social Psychology*, 1971(Mar), Vol. 7(2), 151-172. Tested derivations from the gain-loss model of interpersonal attraction of F. Aronson and D. Lindner (see PA Vol. 39:14921). Liking change was examined in 84 female undergraduates within negative-positive and positive-negative sequences that consisted of evaluations differing in magnitude. Results confirm gain-loss derivations in both sequences where evaluations of minor importance were followed by evaluations of major importance (a negative-positive sequence induced increases in liking; a positive-negative sequence induced decreases in liking). Supportive results were also found in 1 major-minor sequence. A major negative-minor positive sequence produced increases in liking but the major positive-minor negative sequence did not produce decreases in liking. In addition, the final liking ratings showed that a positive-negative sequence induced greater liking than a negative-positive sequence rather than the reverse. Results are discussed in terms of the limits they suggested for the gain-loss model.—Journal abstract.

4845. O'Brien, Gordon F. (U. Melbourne Australia) **Group structure and productivity.** *Australian Military Forces Research Report*, 1970(Aug), No. 7-70, 122 p. Assigned regular Australian Army soldiers to 60 4-man groups which varied in status structure and task. Findings indicate that (a) the nature of the perceived group interaction is significantly affected by the group task, (b) productivity of the groups is a complex function of the status (rank) hierarchy of the group, the kind of task, and the measure of productivity used, (c) the quality of performance is significantly related to the status congruence of the groups, and (d) leader effectiveness depends upon the personal attributes of the leader, the kind of group task, the rank of the leader, and the quality of leader-member interpersonal relations. Findings contribute to the social psychology of small groups and provide strong support for the basic conceptual scheme of structural role theory which emphasizes the primacy of the task system for understanding group interaction. (18 ref.)—Journal abstract.

4848. Sabroe, Knud E. (Aarhus U., Psychological Inst., Denmark) **Ledelse og lederuddannelse en sammenfatning.** [Leadership and leader education.] *Nordisk Psykologi*, 1969, Vol. 21(3), 177-202.—The expansion of leadership since 1900 is shown by a chronological approach. The influence of genetic philosophy, trait psychology, group psychology, and human relations philosophy is discussed, and a statement on the problem of industrial democracy is made. Not until the late 1930s is it possible to find references to systematic treatments of leader education. A heavy influence from trait psychology, accepting innate traits as determinants, is suggested. Of methods in the human relations approach, role playing, case method, and sensitivity training are described; some newer methods are briefly mentioned. The effectiveness of different methods is discussed and the problem of making sufficiently controlled experiments and creating valid criteria is regarded as the major reason for the lack of research. More and more the tendency seems to be towards a leadership definition founded on the human relations approach, and an extended use of the methods which support this philosophy. (3 p. ref.)—*English summary.*

4849. Shubik, Martin. (Yale U.) **Games of status.** *Behavioral Science*, 1971(Mar), Vol. 16(2), 117-129.—Examines possible applications of game-theoretic reasoning to sociological problems. Mathematical models are used initially to examine the results of 2-person nonconstant sum games in which a single value, status, is maximized, and subsequently to examine the results of multiperson games. The 2-person, single-value-maximizing game quickly demonstrates behavior to be purely competitive. The multiperson game illustrates possibilities of coalition behavior, as demonstrated elsewhere in game theory, which includes the possibility of combinations against individual players, but the outcomes are highly sensitive to the values assigned to status factors, as in peck orders and potlatches. The relationship between games of status and simple games is also examined.—*Journal abstract.*

4853. Summers, David A., Taliaferro, J. Dale, & Fletcher, Donna J. (U. Kansas) **Judgment policy and interpersonal learning.** *Behavioral Science*, 1970(Nov), Vol. 15(6), 514-521.—96 undergraduates predicted another person's judgments about the socioeconomic growth of a series of underdeveloped nations. Following each prediction, Ss were informed of the actual judgment made by the person (target) whose policy they were attempting to learn. Results from 150 learning trials

revealed that interpersonal learning was significantly influenced by (a) the substantive differences among the judgment policies to be learned, and (b) the type of information initially available to the learner. Regarding the latter, it was found that Ss who were shown a quantitative description of the target's policy provided by a regression analysis learned to predict the target's judgments with substantial accuracy. In contrast, Ss who were initially shown policy descriptions (either quantitative or verbal) provided by the target himself performed significantly less well. (17 ref.)—*Journal abstract.*

4854. Thomas, Marilyn & Levin, Jack. (Boston U.) **Social constraint as a determinant of charitable behavior.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 14.—To test the effect of social constraint on charitable behavior, 64 undergraduates were asked for contributions to a charity. Experimental conditions were created by announcing that (a) contributors' names would be posted (high constraint), or (b) that donors would remain unidentified (low constraint). A 2×2 analysis of variance indicated that high constraint produced significantly more charitable behavior than low constraint. In addition, females tended to be more charitable than males.—*Author abstract.*

4855. Vondracek, Fred W. & Marshall, Marilyn J. (Pennsylvania State U.) **Self-disclosure and interpersonal trust: An exploratory study.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 235-240.—Administered the Rotter Interpersonal Trust Scale and a self-disclosure questionnaire to 2 samples of undergraduates. With 54 Ss, self-disclosure to a specific target person was relative to interpersonal trust; with 62 Ss, an attempt was made to tap a more generalized concept of revealingness and to relate it to interpersonal trust. Failure to demonstrate the hypothesized relationships is discussed with reference to unsatisfactory conceptualization of the major concepts and their relation to one another, and possible weaknesses in the measurement procedures. (30 ref.)—*Journal abstract.*

4856. Vraa, Calvin W. (U. North Dakota) **Influence of need for inclusion on group participation.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 271-274.—Studied 4 measures of the personality need for inclusion to determine their relationship with group membership. 24 graduate students were assigned to 3 interaction groups. Group membership was defined on the basis of participation, ability to communicate, attitudes and feelings, and respect for other group members. After 10 group sessions the members were ranked. Kruskal-Wallis H test showed that scores on wanted inclusion of Fundamental Interpersonal Relations Orientation (FIRO)-Behavior and on expressed inclusion of FIRO-Feeling were significantly related to group membership.—*Journal abstract.*

4857. Walton, Richard E. (Harvard U.) **A problem-solving workshop on border conflicts in Eastern Africa.** *Journal of Applied Behavioral Science*, 1970(Oct), Vol. 6(4), 453-496.—6 participants each from Somalia, Ethiopia, and Kenya met on neutral turf and participated in a 2-wk workshop to search for solutions to the border disputes between Somalia and her 2 neighbors. The workshop was a social invention based on ideas and techniques generated by the behavioral sciences. This pilot venture, a mixture of successes and failures, can provide the basis for improvement and extension of the concept. Implications can be drawn for the composition

of participant groups, duration, location, and goals in organizing future workshops; and for the techniques, groupings, and pacing utilized during the workshop. Comments by J. Harr, A. Klienbergh, and B. Wedge, follow the article.—*Journal abstract.*

4859. Wyer, Robert S. (U. Illinois, Chicago Circle) **Effects of outcome matrix and partner's behavior in two-person games.** *Journal of Experimental Social Psychology*, 1971(Mar), Vol. 7(2), 190-210.—Tested the formulation of R. S. Wyer (see PA, Vol. 44:2267) of behavior in 2-person games, which predicts responses as a function of 3 descriptive parameters of the payoff matrix and the expectancy for how the other (O) will respond. An experiment with 120 undergraduates systematically manipulated payoff values in the matrices to which Ss were exposed, and used a simulated O who responded in a predetermined random sequence. Effects over a series of 50 trials were generally consistent with predictions. However, quantitative predictions of individual Ss' behavior were fairly inaccurate. Additional data indicate that, at least in Prisoner's Dilemma games, quantitative predictions of behavior were substantially more accurate when Ss interacted with real rather than simulated Os. The tendency for Ss to reciprocate cooperative behavior appeared to be less when O was simulated. These differences occurred despite the fact that between-group comparisons showed no difference between the effects of playing with real and simulated Os. Differences are tentatively attributed to a decreased utility attached by Ss to the points received by O under simulated conditions.—*Journal abstract.*

Influence & Communication

4860. Allan, Thomas K. & Allan, Kathryn H. (U. Maryland) **Sensitivity training for community leaders.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 577-578.—Observations by the authors that sensitivity groups often produce cohesion and increased risk-taking actions among their members stimulated this pilot project in a community conflict situation. Negro and white community leaders in a Southern city participated in a small group for 8 wk. Results included the expected cohesion, increased personal risk-taking, and changes in self-perceptions and perceptions of others. Most interesting of all were some explicit political behaviors on the part of both members and nonmembers which were apparently a result of the group's learning.—*Author abstract.*

4862. Heigl, Franz. (Inst. for Psychoanalysis & Psychotherapy, Göttingen, W. Germany) **Einige Gedanken zur Gruppendynamik.** [Some thoughts on group dynamics.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1970(Jan), Vol. 16(1), 80-98.—Discusses the history and functions of group dynamics. T-group and training laboratory are the 2 dynamics. T-group and training laboratory are the 2 teaching and learning methods in applied group dynamics which deals with social processes of change, i.e.,

collective forms of behavior. T-group and training lab offer the possibility of determining the meaning of a person for the group by eliminating his social status. A group usually comprises 10 participants and 1 trainer and frequently a co-trainer. 1 of the problems of applied group dynamics is that persons who are indicated for psychotherapy may participate in T-groups, tending to misuse them for their own purposes because of their regressive therapeutic needs and lack of desire to learn. T-groups are constituted mainly by psychiatrists, clinical psychologists, educators, social workers, and executives. There are major differences between psychotherapeutic groups and T-groups. The latter are limited to 1 or 2 wk, while group therapy may extend over years. Members of a T-group live as a community and are healthy professionally successful persons. The feedback method encourages peer observation while the interpretations of the therapist often discourage it. Face-to-face groups, e.g., in business organizations, have shown encouraging results. (18 ref.)—*B. Schay.*

4863. Johnson, David W. (U. Minnesota) **Effects of warmth of interaction, accuracy of understanding, and the proposal of compromises on listener's behavior.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 207-216.—2 male and 2 female confederates expressed warmth or coldness, accuracy or inaccuracy of understanding in their interaction with 64 male and 64 female undergraduates, and proposed compromises or not, depending upon the experimental condition. It was hypothesized that (a) accuracy of understanding would result in the conviction that one has been clearly heard and understood and in a willingness to reach an agreement in negotiations, (b) the expression of warmth toward the S would result in favorable attitudes toward the confederate, and (c) more agreements would be made when compromises were proposed than when they were not. Results confirmed all 3 hypotheses.—*Journal abstract.*

4864. Jones, Reginald L. (U. California, Riverside) **Learning and association in the presence of the blind.** *New Outlook for the Blind*, 1970(Dec), Vol. 64(10), 317-324.—On the basis of evidence that the presence of a blind person in situations involving interpersonal contact will lead to general discomfort, it was hypothesized that it would also be disruptive to cognitive functioning. Ss were 16 male and 14 female undergraduates, and confederates were 2 male undergraduates alternating between the roles of blind S and I. $\frac{1}{2}$ the Ss were assigned to the "blind" confederate and $\frac{1}{2}$ to the sighted I. The S's task was to learn 25 words, presented via tape recorder, in 5 trials. Results reveal no significant differences in learning or associative clustering for Ss of either sex, learning in the presence of sighted or blind confederates. A 2nd similar study was done with extensive interviewing to refine the methodology. It was found that Ss felt that their performance was impaired in the presence of the blind while actually it was not.—*S. Diamond.*

4865. Klein, Ronald L. & Birren, James E. (U. Southern California, Gerontology Center) **Age and susceptibility to social influence.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 601-602. Attempted to determine if age, sex, and task difficulty act as determinants of social conformity in a laboratory perceptual judgment task. 36 young Ss (16-21) were compared with 36 old Ss (60-86) regarding susceptibility to social

influence upon perceptual judgments. A series of visual perceptual judgments were presented on slides. Ss were required to judge which of the 2 stimuli (circular discs) was greater in size. Using a modified Crutchfield apparatus, both groups were subjected to contrived group pressures toward erroneous perceptual judgments. An analysis of variance of frequencies of conforming behavior revealed that (a) older Ss conformed significantly more often than younger Ss, (b) there was not a significant sex difference in conformity behavior, (c) conformity occurred more frequently as stimulus ambiguity of the perceptual task increased, and (d) the increase in conformity scores as task difficulty increased was larger for the older Ss. Results indicate that older individuals are subject to social influence, and demonstrate a disparity between the conformity behavior of young and old individuals.—*Author abstract.*

Social Perception & Motivation

4867. Ajzen, Icek. (U. Illinois) **Attribution of dispositions to an actor: Effects of perceived decision freedom and behavioral utilities.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 144-156.—Described situations in which a hypothetical actor was faced with a choice between alternative behaviors. Each situation varied along 2 dimensions: the actor's perceived decision freedom (high vs. low) and the utilities of the behavioral alternatives (high vs. low). 201 undergraduates estimated the probability that the actor would engage in each of the behavioral alternatives. Ss were told which alternative the actor had chosen and were asked to attribute attitudes or personality traits to the actor on the basis of his choice. Perceived behavior probabilities were shown to be influenced by the actor's decision freedom and by the utilities of the available alternatives. Also, consistent with expectations. The strength of an attribution was a negative function of behavior probabilities. The effects of decision freedom and of behavioral utilities on attribution strength could be predicted from the influence of these variables on behavior probabilities and from the inverse relation between behavior probabilities and attribution strength. Evidence is presented for the utility of a Bayesian approach to the prediction of attribution. *Journal abstract.*

4868. Berscheid, Ellen; Dion, Karen; Walster, Elaine, & Walster, G. William. (U. Minnesota) **Physical attractiveness and dating choice: A test of the matching hypothesis.** *Journal of Experimental Social Psychology*, 1971(Mar), Vol. 7(2), 173-189.—Examined whether the failure of previous studies to support the hypothesis, that individuals chose to date those whose "social desirability" level is similar to their own was due to minimization of possibility of rejection. 2 experiments with 347 and 112 undergraduates were designed to test the matching hypothesis; and the salience of possible rejection by the dating choice was varied. Both experiments found support for the principle of matching in social choice. This support was obtained, however, not just under conditions in which rejection was presumably salient but for all conditions of choice.—*Journal abstract.*

4869. Britt, David W. (Vanderbilt U.) **Effects of probability of reinforcement and social stimulus consistency on imitation.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 189-200.—Evaluated the effects of probability of reinforcement and degree of stimulus consistency on imitation in ambiguous, competitive situations. 3 experiments with 144, 18, and 72 undergraduates are reported, each addressed to a different specific problem concerning the relationship among these variables and the elimination of alternative explanations for the observed results. It was found that (a) Ss in ambiguous, competitive situations tend to imitate stooges to the degree that they are competent (i.e., to the degree that they are instrumental in procuring reinforcement); (b) the relationship between probability of reinforcement and imitation is considerably stronger when the stooges agree (consistent stimuli) than when they disagree (inconsistent stimuli); and (c) imitation of consistent social stimuli is more stable than imitation of inconsistent social stimuli. Credibility is discussed as a crucial variable. (16 ref.)—*Journal abstract.*

4870. de Leon, Patrick H., de Leon, Jean L., & Swihart, Phillip J. (Purdue U.) **Relation of accuracy of self-perception and peer ratings.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 966.—Investigates whether individuals who have an accurate self-perception are viewed more positively by their peers. 51 sorority and 65 fraternity Ss rated themselves and their house members on 7 variables found to be important in interpersonal relationships. Significant relationships between self-perception and peer ratings were found for male but not female Ss. The existence of a sex discrepancy was noted in a different study.—*P. Hertzberg.*

4871. Dutton, Donald G., & Arrowood, John A. (U. British Columbia, Vancouver, Canada) **Situational factors in evaluation congruency and interpersonal attraction.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 222-229. Created 4 experimental conditions in which 80 female undergraduates presented arguments in support of an opinion position on a topical issue. 2 variables were manipulated factorially: (a) whether the position which the S presented was her own or opposed, and (b) whether the S thought that she had argued well or poorly. Ss were evaluated by each of 4 confederates as to (a) whether or not the confederates agreed with the position, and (b) how well the confederate thought the S had argued. The chief dependent variable was the rated likability of the 4 confederates. It was found that when Ss were presenting their own positions on the issue, likability ratings depended primarily on whether or not the confederate agreed with the position (content congruency) and only secondarily on whether or not the confederate agreed with the subject's own evaluation of how well she had argued (form congruency). When Ss were presenting positions opposite to their own, likability ratings depended primarily on form congruency and only secondarily on content congruency. It is concluded that the differential effect of content and form congruency on interpersonal attraction depended on the S's goals in a given situation.—*Journal abstract.*

4872. Ellgring, Johann H. (Max-Planck Inst. of Psychiatry, Munich, W. Germany) **Die Beurteilung des Blicks auf Punkte innerhalb des Gesichtes.** [Judgment of glances directed at different points in the face.] *Zeitschrift für experimentelle und angewandte Psychologie*.

1970, Vol. 17(4), 600-607.—Investigated the perceptibility of eye contact. 16 female Ss serving both as senders and receivers, judged which of 7 points in the upper 1/2 of the face was fixated by a sender of looking signals at 80- and 200-cm distance. A better than chance result was found at both distances. Introverts scored more hits at 200 cm. than extroverts. (English & French summaries)—*W. J. Kopitz.*

4873. Gitter, A. George; Satow, Y., & Goldman, A. (Boston U.) **Leadership: Nonverbal communication and mode of presentation of stimuli.** *CRC Report, Boston U.*, 1968(Aug), No. 25, 57 p.—A 2×3 factorial study ($N = 107$ undergraduates) tested the effects of (a) nonverbal communication (NVC, strong vs. weak), and (b) sensory modality of presenting (MOP) the stimuli (audio-visual vs. visual-only vs. audio-only) on person perception. Both univariate and multivariate results indicate a highly significant NVC effect. Strong NVC, as contrasted with weak NVC, led to perception of an actor as high on leadership-structure and low on consideration. The effect of MOP was far less potent than that of NVC. (5 p. ref.)—*Journal abstract.*

4874. Gitter, A. George & Walkley, John. **Nonverbal communication: Leader-follower perception and mode of presentation.** *CRC Report, Boston U.*, 1968(Jun), No. 21, 54 p.—Investigated the effects of nonverbal communication (NVC), sensory modality of presentation of stimuli (MOP), and set of S on (a) attitude change, and (b) person perception, using a $2 \times 2 \times 2$ factorial design. Pre- and postattitude measures, and 32 posttest person perception scales were administered to 55 male and female (1:1 ratio) undergraduates. 2 levels of NVC (leader vs. follower) and 2 levels of MOP (audio-visual and audio-only) were employed. NVC, MOP, and sex of S were all insignificant in effect on attitude change. Person perception results were derived from a factor analysis of person perception scales scores. Rotated Factor I—leadership-structure, and Factor II—leadership-consideration, accounted for 28 and 13% of the variance, respectively. For Factor I, an analysis of variance indicates a significant main effect for NVC; main effects for sex and MOP and interactions (Sex \times NVC \times MOP) were insignificant. For Factor II, main and interaction effects were all insignificant. (5 p. ref.)—*Journal abstract.*

4875. Greenberg, Martin S., Block, Myron W., & Silverman, Michael A. (U. Pittsburgh) **Determinants of helping behavior: Person's rewards versus other's costs.** *Journal of Personality*, 1971(Mar), Vol. 39(1), 79-93.—50 undergraduates were randomly assigned to 4 experimental conditions and 1 control condition. The 4 experimental conditions each yielded an equal amount of financial inequity in the sense that person received more than he was entitled to because of the efforts of other, and/or other received less than he ought to as a result of trying to help person. The 4 experimental conditions differed in terms of the relative contribution of person's rewards and other's costs to the inequity. Results confirmed the prediction that willingness to help another is more a function of rewards received than costs incurred. (16 ref.)—*Journal summary.*

4876. Jacoby, Jacob. (Purdue U.) **Interpersonal perceptual accuracy as a function of dogmatism.** *Journal of Experimental Social Psychology*, 1971(Mar), Vol. 7(2), 221-236.—Examined the generally held assumption that perception of others is partially shaped by the personality of the perceiver. A field experiment was

conducted in which 46 graduate students divided into small groups and working on personally relevant and important tasks, interacted over a 10-wk period. Tested at the end of this period with Rokeach's Dogmatism Scale, the hypothesis that open-minded Ss are more accurate perceivers of another's degree of dogmatism than are closed-minded Ss was supported ($p < .01$). (29 ref.)—*Journal abstract.*

4877. Lawson, E. D. (State University Coll., Fredonia) **Hair color, personality, and the observer.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 311-312.—Investigated stereotypes associated with hair color. 79 male and 161 female undergraduates completed semantic differential scales on 7 categories of hair-color person. Dark men clearly preferred brunette women; blond men were equally divided in preference for blondes and brunettes; blond, brunette, and red-headed women clearly preferred dark men; and artificial blondes preferred dark and blonde men. Other comparisons were made within sex and between hair-color groups. Results indicate: (a) stereotypes based on hair color are widely held, (b) different stereotypes exist on the basis of the hair color and sex of the respondent, and (c) 4 of the 6 hair-color categories gave the highest scores to their own group.—*Journal abstract.*

4878. LeCompte, William F. & Rosenfeld, Howard M. (U. Houston) **Effects of minimal eye contact in the instruction period on impressions of the experimenter.** *Journal of Experimental Social Psychology*, 1971(Mar), Vol. 7(2), 211-220.—Randomly assigned 28 male and 28 female undergraduates to 2 male Es and to 2 conditions of visual attention. The Es were presented on videotape reading task instructions, and either did not look up or glanced toward the Ss on 2 specific occasions. Ss then completed a set of 18 rating scales giving their impressions of the E. The impression scales were reduced to 7 orthogonal factors and factor scores were analyzed for variance due to Es, visual behavior, and sex of the S. Glancing toward Ss produced ratings of Es as less nervous ($p < .05$) and as less formal ($p < .05$). Rated differences in status between Es ($p < .001$) were independent of the effects of differential glancing. No effects of sex of the S were apparent. The impressions that were mediated by variations in the E's glancing were similar to those that were associated with E bias in previous research.—*Journal abstract.*

4879. Lindauer, Martin S. (State University Coll. New York, Brockport) **Set and different degrees of ambiguity of the "wife and mother-in-law" figures.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 911-913.—Presents a series of 6 ambiguous wife and mother-in-law figures to 2 groups of Ss who initially saw either the unambiguous wife or mother-in-law. The evidence generally supports the effect of prior experience in influencing the perceptual organization of ambiguous forms. However, data also indicate that some forms were resistant to 1 of the experiential sets. An ambiguous form did not show the effect of set after a 1-wk interval.—*Journal abstract.*

4880. Martens, Rainer. (U. Illinois, Children's Research Center) **Influence of participation motivation on success and satisfaction in team performance.** *Research Quarterly*, 1970(Dec), Vol. 41(4), 510-518.—Studied the effect of affiliation and task motivation on the success and satisfaction of college intramural basketball teams. Over 1200 male undergraduates, members of 144 basketball teams, responded to a pre-

and postseason questionnaire which assessed affiliation, task motivation, and team satisfaction. Teams were categorized into low, moderate, and high levels for both affiliation and task motivation. The number of games won determined success. An Affiliation Motivation \times Task Motivation (3×3) factorial design was used. The multivariate analysis of variance for the affiliation hypothesis was significant, indicating that high affiliation-motivated teams in contrast to moderate and low affiliation-motivated teams were less successful but more satisfied. High task-motivated teams, on the other hand, were more successful and satisfied than moderate or low task-motivated teams. No significant interaction between task and affiliation motivation was found.—*Journal abstract.*

4881. Midlarsky, Elizabeth. (U. Denver) **Aiding under stress: The effects of competence, dependency, visibility, and fatalism.** *Journal of Personality*, 1971(Mar), Vol. 39(1), 132-149.—80 male sophomore and junior students were assigned randomly to 8 different treatment conditions in a $2 \times 2 \times 2$ factorial design study of helping behavior (number of shocks which S took for collaborator). Results showed competence, dependency, and visibility to increase aiding whereas fatalism (locus of control) was inversely related to helping behavior. (22 ref.).—*M. D. Zwiier.*

4882. Sinha, A. K. (Ministry of Defense, New Delhi, India) **Relationship between ethnic stereotypes and social distance.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 216.—Administered the modified form of the Bogardus Social Distance Scale to 100 male and 100 female university students. Results reveal a significant positive correlation between the percentage of desirable characteristics assigned to 10 ethnic groups and their average social-distance scores. Rhos were .83 for total sample; .85 for male Ss and .92 for female Ss ($p < .01$).—*Author abstract.*

4883. Webster, Murray A. **Status characteristics and sources of expectation.** *Center for the Study of Social Organization of Schools Report*, Johns Hopkins U., 1970(Sep), No. 82, 39 p.—A previous version of expectation theory assumed that the likelihood that evaluations will be accepted and used to assign performance expectations for group members depends upon the perceived ability level of the evaluator. An extension of the theory asserts that, in the absence of knowledge of the evaluator's ability, acceptance of his evaluations depends upon his status characteristics. In an experimental test, 100 16-18 yr. old males were assigned randomly to 4 conditions, where they received either positive or negative evaluations from an evaluator possessing either higher or lower status than they. Results are as predicted for 3 of the 4 conditions. A possible interpretation of the 1 discrepancy is considered, and its theoretical significance is discussed. (28 ref.).—*Journal abstract.*

COMMUNICATION

4884. ———. **Soznanie i obshchenie.** [Consciousness and communication.] Frunze, USSR: Ilim, 1968. 96 p.—6 contributors present articles on the problem of consciousness and communication, philosophically and psychologically considered. These include discussions of experimental methods of semantic analysis, information theory and the physiology of higher nervous activity, and the empirical parameters of
